
[Continued.]

prico, that would be very serious from a national point of view?—Yes.

16,067. I think you were asked with regard to the question of Government boring. May I just put this question to you: Assuming that it was considered desirable that Government borings should take place to disclose the minerals in undeveloped areas, could not the Government impose, in respect of the particular problem it was dealing with, such conditions as it regarded necessary to recoup itself?—Yes, I think so.

16,068. Would there not be a difficulty in trying to separate the ironstone, which was not going out of the coal pit, from the ironstone which was going out of the coal pit?—Separate it in what way.

16,069. The Chairman asked you, assuming you were to carry out nationalisation—only assuming—on that assumption is there not very considerable difficulty in separating ironstone that would be going out of the coal pit along with coal and iron when that was not so coming out?—Yes, I think there would, probably.

16,070. If you decided to nationalise the minerals, would you not require to nationalise all the minerals of the particular class that you were dealing with; that is to say, if it was coal, you would need to take

all the coal, if it were ironstone you would need to take all the ironstone?—I expect you would.

16,071. Would you see any other way of dealing with it?—No, I should not.

16,072. Would the same thing apply to fireclay?—Yes, some fireclay.

16,073. Could you nationalise a certain quantity of fireclay, and yet exclude from your nationalisation other fireclays?—I am afraid not.

16,074. Would you really, from a practical point of view, be able to define the position at all sufficiently closely to draw a dividing line?—I am afraid not.

16,075. So if your view is that once you begin to nationalise certain minerals, you must nationalise all the minerals of that class?—Yes.

16,076. *Chairman*: Does that refer to blackband and hematite?—It refers to blackband and clayband.

16,077. *Mr. Evan Williams*: You have said that you agreed with Sir Richard Redmayne that there should be more collective production?—Yes; I am here of course speaking only for Scotland.

16,078. Then it applies practically exclusively to the existing collieries?—Yes.

16,079. You have those in your mind rather than any collieries that may be developed in future?—Yes.

(Adjourned for a short time.)

16,080. *Mr. Evan Williams*: I was asking you before the adjournment about your suggestion that there should be more collective production. Have you thought at all of any machinery whereby that could be brought about?—Well, I have not gone into detail at all in regard to the question, but I assume that there would be a tribunal of some sort. I think it might come about in this way, that suggestions would be made from people like myself who see the desirability of collective production in a district, and if the parties interested did not agree, then the matter could go to this tribunal.

16,081. On whom do you think the initiative should lie in a matter of that kind?—I think it would lie on the colliery owners.

16,082. Would you leave it to purely voluntary action on their part?—I think I would.

16,083. Would you give such a body as you suggest should be set up powers to step in and dictate what should be done, subject, of course, to the views of the interested parties, and give them the power of initiative?—I do not like the word "dictate" altogether. It seems to me to be manifestly in the interests of everyone that something should take place, and I do not think there should be any difficulty.

16,084. You would not object to initiative with regard to that body?—Initiative, of course, is the making of a suggestion.

16,085. In what kind of circumstances do you think that collective production of that kind might be brought about?—Supposing that you have half a dozen collieries in a district, say, three or four miles long—I have a case in point in my mind at the present moment, and it is being worked by half a dozen tenants. I think the question has now become a difficult one. Each man has been rather inclined to let someone else pump the water, and the time has now come, to my mind, when there ought certainly to be a joint scheme for pumping this water. If this goes through, I myself would suggest to this tribunal that this should be taken up. I happen to act for all the landlords in the particular district. That is a case in point.

16,086. In a case of that kind, apart from any voluntary initiative on the part of the owners of these collieries, you would give this body power upon representation made to it to act?—Yes, by myself or anyone you like in the district.

16,087. And to enquire into all the circumstances and to make proposals to them?—Yes.

16,088. But you would not go so far as to give this body power to impose its decisions?—I am not sure about that.

16,089. Is there any feature besides the pumping of water which you take into consideration?—You might get your barriers removed, such as they are.

16,090. Do you mean by common pumping in that way you get out all the coal?—Yes.

16,091. All the coal consistent with that?—Yes.

16,092. Would you suggest that in a case of that kind there might be some common source of power set up between them?—Yes.

16,093. Is there any other consideration which you think might be brought in to make it desirable for collective production or unification of interests?—Nothing occurs to me at the moment.

16,094. Would you confine the size of the new unit to that which is the best for bringing about the results?—I would.

16,095. The physical results which you have been talking about?—Yes.

16,096. You would not take commercial results into consideration?—I think you would have to do that.

16,097. In forming units of this kind, do you think it wise to go beyond such a size that one man can efficiently supervise?—No, I think not; it would be better to have one man supervising it.

16,098. It should be of such a size that a man could keep in touch with the whole?—Yes, if possible.

16,099. Do I take it your view is, if it gets beyond the power of one man effectively to supervise, you lose efficiency?—Probably you would.

16,100. In answering the Chairman's questions as to the valuation of collieries, assuming they had to be taken over by the State, you said that you valued the machinery at its break-up value?—Yes, at the time of the exhaustion of the coal at the end of the lease. I would look to the lease being extended until the coal was exhausted and then the machinery would be sold at break-up value.

16,101. Is not that the value which you take into account at the time of the transfer of the collieries?—Of course, a going colliery is quite different from the break-up value.

16,102. We were talking of the value of going collieries. Assuming nationalisation is brought about and a valuation has to be made, would you proceed to value upon the basis you mention?—It would be the going value of the colliery.

16,103. In that case would you value as between two ordinary purchasers and sellers?—Yes.

16,104. In that case you do not take the break-up value but the going value?—Yes.

16,105. And the mechanical equipment of the colliery as well as its probable life?—Yes.

16,106. And the whole of its assets?—Yes. The machinery is no use unless the coal is there. The machinery is there to make a profit on which I make my valuation.

9 May, 1919.]

MR. JOHN DAVID McLAUGHLAN.

[Continued.]

16,107. You can imagine that an old Cornish pumping engine with a heavy wheel would have a very much greater break-up value than a modern turbine and generator?—Yes.

16,108. *Mr. R. W. Cooper*: Without going into any discussion of details of valuing collieries, I understand you say there is no difficulty at all amongst experts who know their business in valuing collieries?—No, it is done every day.

16,109. In valuing either the profit interest of the lessee on the one hand or the rental interest of the lessor on the other?—That is so.

16,110. In your *précis* you refer to the fact that in Scotland your leases are not generally for more than 31 years?—That is so.

16,111. What is the cause of that? Is it because the Scottish estates are entailed?—Yes.

16,112. Have you not a considerable number of estates where the owner is absolute owner?—We have not a great many.

16,113. Have you no Settled Land Act such as we have in England?—I do not think so, but I am not a lawyer.

16,114. But you know of no means by which the life renter, as you call him in Scotland, can get a right to grant a longer lease?—No. I think they have to go to the Court of Session. I want to well-known law agents in Edinburgh with regard to this point, and they informed me that 31 years was, as a rule, the length for which a lease could be granted.

16,115. What surprises me is that you never have lessees asking you to give longer leases than that?—We have.

16,116. Have you longer leases?—I know of some instances.

16,117. Was that done on application to the Court?—No. This was the case of an unentailed estate.

16,118. But I am speaking of an entailed estate? I have never known them to go to the Court of Session for power. The lessees feel safe in assuming the lease will be renewed at the end of 31 years.

16,119. There is a well-founded expectation of renewal?—Yes.

16,120. And the lessees have confidence in that renewal being granted?—That is so.

16,121. Towards the end of your *précis* you say that if the mines were taken over by the State the rights of the surface owners would require to be carefully considered?—Yes, if the minerals were taken over.

16,122. Now what about buildings? Does it not occur to you that the owner of buildings might say, "No, I require to have my buildings supported; I do not care about compensation"?—He would certainly say that in many cases, I think.

16,123. And the owner of every piece of land or every house being *prima facie* entitled to have support, might say, "I will not take your damages and have my house cracked, but you must respect my rights"?—Yes, but I suppose if the State takes the minerals over it can do what it likes.

16,124. Why should the surface owner be deprived of his rights because the State takes over the minerals?—I do not think he should be.

16,125. *Sir L. Chiozza Money*: I understand that you have a very wide experience as a Scottish mining engineer?—Well, I have been 40 years at it now.

16,126. May I ask you this question: Taking Scotland as a whole, will you kindly tell us what is the proportion of what I may call modern, up-to-date mining plants where you have up-to-date and efficient winding machinery, and where you have a shaft of a considerable capacity, and where you have a cage which will hold a considerable number of men admitting of rapid winding?—I cannot tell you the proportion, because I do not know.

16,127. Would it be one-half?—It is very hard to say at the moment, but I am sure it is more than that.

16,128. Would you be surprised to learn that His Majesty's Mining Inspector for Yorkshire and the North Midlands, when I asked him exactly the same question, which I read out to you, answered probably about one-third? Would you be surprised to learn that?—I would.

16,129. You think that the answer for Scotland—your professional answer—would be at least one-half?—Yes.

16,130. And probably more than one-half?—Yes.

16,131. Is that your reason for thinking Scotland is more efficient, as I understood you said to Sir Adam Nimmo, than England as a whole?—I said I could not compare the two, because I do not know about England.

16,132. I understood Sir Adam Nimmo put it to you that Scotland was rather more efficient than England, but probably I was mistaken?—I think you were.

Chairman: It was with regard to coal-cutting machines.

Witness: Yes, and I think the figures proved him to be correct.

16,133. *Sir L. Chiozza Money*: Now I will ask you something wider and more interesting and which is very important. What I want to know is: are the great majority of the mining plants of Scotland really modern in the ordinary sense of the word?—I think you may say the majority really are.

16,134. Is there a substantial minority which is not modern?—They are quite efficient for what they have to do, because they are on shallow mines and so on.

16,135. But you are surprised to learn this verdict for Yorkshire and the Midlands?—Yes.

16,136. Are you acquainted with the fact that taking England as a whole there are a great many mines which are not modern, which have very small shafts, very small cages, very antiquated mining engines, and so forth?—It may be so.

16,137. With regard to coal-cutting machinery, is it the fact that the latest figure for Scotland is only 987?—We heard that to-day.

16,138. Is not that a very low figure for 1916?—But we could not get them.

16,139. Is it not the fact that, curiously enough, during the war they multiplied more rapidly than before?—I do not know.

16,140. Is it not the fact that when the last mining Commission reported, only 5 per cent. of our coal was got by coal-cutting machinery?—I do not know.

16,141. Is it not the fact that only 10 per cent. is got by coal-cutting machinery in the United Kingdom?—I have not the figures, but I take it from you.

16,142. You do not think I am very far wrong, do you?—I do not know.

16,143. After all, it is a thing you ought to know more about than I?—I have been occupied with other things, of course.

16,144. I want your opinion because I value it, and I want to get at the truth. Do you think 987 coal-cutting machines for Scotland in 1916 is a satisfactory figure?—I think it is.

16,145. Do you think that 10 per cent. of coal in this country got with coal-cutting machinery is a satisfactory figure?—You want coal-cutting machinery mostly for thin seams.

16,146. Are there not very many thin seams?—Yes, there are in Scotland, but I do not know about England. That may account for your having fewer in England, because you have thicker seams.

16,147. Is it the fact that the proportion got in England is incredibly small considering the time in the world's development which we have got to?—I do not think I would go that length.

16,148. I was asked the other day whether I have inspected mines. I have seen the surface of a good many mines and come across a good many inefficient plants?—You have to remember that you cannot use coal-cutting machines in certain seams satisfactorily. Everything depends upon the condition of the roof, pavement, and so on.

16,149. Is it not the fact that the Coal Commission of 1903-5 advised on this by men from all parts of the country, reported that the use of coal-cutting machinery was very small?—Very likely.

16,150. Is it not the fact that progress has been made since then, but the number of coal-cutting machines is very small?—Perhaps.

9 May, 1919.]

MR. JOHN DAVID McLAUGHLAN.

[Continued.]

16,151. Is it not the fact that it is true to say that the amount of efficiency from a technical point of view in the mines of this country taken as a whole is not what it ought to be?—I suppose nothing in the country is what it ought to be.

16,152. That, of course, would be true of a very much more advanced position, but remember this is very important?—Yes.

16,153. What is your honest opinion with regard to the technical efficiency of British mining taken as a whole?—My opinion as to technical efficiency of British mining taken as a whole?

16,154. It is a perfectly plain question, and you are well qualified to answer it?—I know nothing about England.

16,155. With regard to Scotland, should I be right in saying that one-third of the mines are not modern and up-to-date?—What do you mean by saying that one-third are not modern and up-to-date?

16,156. That is to say, that they have shafts of an inconsiderable size?—What do you mean by that? That is vague.

16,157. There are shafts 10 feet wide?—You said "wide"?

16,158. Yes?—What is wrong with a shaft 10 feet wide—nothing at all.

16,159. Is it a fact that there is room in Scotland for the extension of two-deck cages?—Yes, certainly I agree there is room for improvement.

16,160. There is room for more coal-cutting machinery?—Probably there is.

16,161. I ask you from your knowledge?—I think there is.

16,162. These things are important?—Yes.

16,163. Then with regard to winding machinery, is there room for the introduction of more modern and more rapid winding machinery in many mines?—No, I do not think so. You say more rapid machinery?

16,164. Yes?—No; I think it is quite efficient.

16,165. But rapidity is what I am speaking of. You do not think there is any room for that?—Well, what would you suggest?

16,166. The introduction of better and more up-to-date engines?—I do not think so.

16,167. You have not any winding engines in Scotland as old as myself such as I have seen in Wales?—No.

16,168. What about underground conveyance. Is there room for improvement there?—Yes, certainly, but we have great difficulties, as I have said, in Scotland.

16,169. May I put this to you: During the war in the conduct of the output of munitions in this country, it was found to be a tremendous advantage to have a central governing body, the Ministry of Munitions, which could bring machinery up to date, and which could compel a firm to put out old machinery and put in new machinery, and compel it to be efficient, and which could bring all the firms making shells and so on up to a better standard?—Yes.

16,170. I put it to you as an engineer, if you were put in charge of the mines of Scotland, and you had the power and capital at your hand to improve them, is there room for a considerable body of improvement?—I cannot deny that; I think there is room for improvement everywhere.

16,171. Will you go so far as this, as to admit that such a power and such an authority could by co-ordination and by comparison of costs and by comparison of methods raise the efficiency of all the mines of Scotland above what it is at present?—I suppose so.

16,172. Is it a fact that it could?—Probably it is a fact that it could.

16,173. I point out to you as a practical man and an engineer that that was done in the war and it was done under circumstances of most tremendous difficulty, not only with regard to the output of shells but with regard to the output of chemicals and with regard to the output of many things required for the war. Do you not think it could be done in peace with regard to mines?—Yes, I suppose it could.

16,174. May I ask you further to consider this. Turning now, if I may, from the technical side to the organisation side, have you seen the Report of the

Committee on the Acquisition for Public Purposes of Rights and Powers in connection with Mines and Minerals, upon which Sir Adam Nimmo questioned you?—I saw it for five minutes before I came in, but I have not read it.

16,175. Sir Adam Nimmo suggested to you a scheme by which a peripatetic advisory committee should travel about the country and as it went from district to district take the advice of local experts with regard to settling how mining leases should be arranged. Did you hear that?—I do not think he said that mining leases should be arranged.

16,176. I thought that was part of the duties?—No, I think it was to arrange about collective production.

16,177. Are you aware that in this Report, which Sir Adam Nimmo signed, so far from suggesting a peripatetic committee, he suggested something very different?—I am not aware of that.

16,178. Will you take it from me that the sanctioning authority would be composed of members of both Houses of Parliament with the addition of outside members experienced in various spheres of national life including labour, and would in fact be a Joint Committee of the two Houses of Parliament?—That would be a fixed tribunal.

16,179. Do you think such a sanctioning authority as that could be effective with regard to the mining industry of this country?—Well, I prefer the other one to move about the country.

16,180. Take the sanctioning authority. Do you think that the sanctioning authority composed of members of the House of Lords and members of the House of Commons, who are busy with other duties, and who have to represent their constituents and to act on Grand Committees, and to attend the House and perform many other functions, as I can tell you, having been one of them, should have charge of this important subject?—Of course I have not considered what should be the constitution of this authority at all. I have not thought it over.

16,181. Do you think it a reasonable proposition as a business man?—It might be that you could get better people for it.

16,182. The report says: "There should be a strong Advisory Council as an essential part of the machinery of the Mining Department consisting of representatives of the mining industry, including workers, together with men eminent in branches of science connected with industry. It should also have local sub-committees reporting to it and similarly constituted." Can you detect anything in that in the nature of a peripatetic committee?—I think not.

16,183. Does it not distinctly point to a central stationary committee and a number of local committees reporting to it and similarly constituted?—Apparently it does.

16,184. Do you realise that this sanctioning authority, a body composed of members of the Houses of Parliament, and which I have suggested to be an impracticable thing for the reason I have named, is to have an insurance fund and is to be an insurance office?—Is it?

16,185. It says so here in section (j) "To prevent the loss of minerals caused by the surface owner having a right of support, we propose that the Sanctioning Authority"—mind you! that is a Committee of both Houses of Parliament—"should in proper cases make compulsory orders for the working of minerals, with power to let down the surface subject to compensation for all damage caused thereby to the surface owners. Such compensation should be secured by the creation of an insurance fund, which should be contributed to by all parties." It therefore is to set up an insurance office. Do you think it capable of managing such an insurance office?—I cannot express any opinion off hand.

16,186. I put it that as a business man you are capable of expressing an opinion?—It is all very complicated. I have not it in my mind.

16,187. Is not the complication rather an accusation against it?—Possibly; it is only complicated so far as I am concerned, because I have not read it.

16,188. What is suggested here is that instead of the present system of about 3,000 mines managed by about 1,500 different companies, with all their boards

9 May, 1919.]

MR. JOHN DAVID McLAUCHLIN.

[Continued.]

of directors and all their officials, there should be this sanctioning authority, with all its officials, to govern the lessors and the lessees, and that there should be the royalty owners—the gentlemen who have appeared before us yesterday and to-day—with their officials and lawyers, all to manage one industry. As a man of affairs and what is commonly called a man of business in ordinary parlance, do you think that is a reasonable proposition?—Do you refer to the mining experts of the Royalty Owners?

16,189. Yes, mining experts.—So far as I know they do not each have one man. An expert like myself is not tied to one man, but I act for one hundred. That is one point.

16,190. The owners have said here that they are quite sure that all the coal is worked in their own interest, and that all the houses are put up in accordance with the clauses in the leases. How is that done if one engineer is acting for a number of them? How are they able to know with regard to a large part of the territory of this country that the leases are fulfilled in their covenants?—All I can say is it is done and done well.

16,191. Do you think if Lord Tredegar, for example, whom I saw here this morning and who is a man who is desirous of doing his duty, really knew of the condition of the cottages which I have seen that he would tolerate it? How do you account for it?—I do not know, I am sure, how far he is responsible for it. How is he responsible?

16,192. He is the lord or king of a coal district?—A king of a coal district?

16,193. Yes, he is the lord of the manor. These are not fancy terms, but very real terms?—Well, they do not apply to us so much in the North. We are a small country with small landlords, and they do not appeal to me so much.

16,194. Whether big or small is it not a fact that a man who grants a lease for the working of the minerals has the right to make covenants in the lease with regard to this, that, and the other—that so much coal shall be got, and the coal shall be economically worked according to the latest practice, and so on?—What is the objection?

16,195. Does not that make him the real governor of the industry?—I do not understand quite what you mean.

16,196. Do you think it does or does not?—I think it does not.

16,197. If it does not, he is a "waster"?—I do not think so.

16,198. If he does not function as the lord and make sure his coal is worked, where does he function?—But he does make sure.

16,199. How does he make sure?—Through his mining engineer or factor.

16,200. Does the mining engineer go round and inspect the mines thoroughly and see that it is done?—Yes.

16,201. This is impersonal, but I want to understand. Do you mind telling me how many you work for? About one hundred, and there are two of us in my firm.

16,202. How many inspectors have you?—I have my assistants.

16,203. How many?—Three or four.

16,204. Three or four inspectors and yourself making sure that all the coal is got out of one hundred collieries?—Yes, properties, not collieries. They go and survey the workings over a quarter and have the whole thing put before them on a plan and it is perfectly easy.

16,205. I should have thought the physical difficulty would be enormous for three or four men?—But you do not know.

16,206. I know enough about a mine to know you cannot thoroughly examine it in a day?—No, but as long as the coal is taken out you can see it on a plan. When a place is stopped you attend to it and see what is wrong. As long as your workings are moving on all the time you can be sure.

16,207. In the case of working a thick seam, are you satisfied everything is done?—Yes. We check that by measurement from the plans.

16,208. And with three or four men you think you are able, on behalf of one hundred owners, to

secure an efficient government of that industry?—Yes.

16,209. If that is so, how do you account for the fact that commission after commission and committee after committee has reported that there are serious disabilities still remaining in connection with these matters?—I cannot understand it.

16,210. Are we to understand that Mr. Leslie Scott's Committee made a list of absurdities when it wrote down fourteen categories of disabilities still remaining?—I do not know about that.

16,211. Sir Adam Nimmo has asked you a lot of questions with regard to this report, and I thought you were acquainted with it?—I thought I explained that I had not seen it.

16,212. Will you agree that every commission and committee have come to one conclusion, namely, that there is an enormous amount of coal wasted?—Do you mean in Scotland?

16,213. I mean for the country generally?—I do not know about the country generally.

16,214. The Committee's Report says, paragraph 5 (V): "Coal is also often left in barriers on the boundary of a mine to prevent the inrush of water from other workings on a higher level. The total area of minerals left in such barriers is very large, and we are satisfied that a comprehensive survey of existing barriers would show that a considerable portion could be worked with safety." Is not that a very great disability which remains at the moment according to this Committee's Report?—Do you mean that there are barriers that are left?

16,215. Yes; that is to say, that the industry is in so far disabled and that the coal is not got which ought to be got?—Yes, to a certain extent, that is so.

16,216. I am taking you through the whole catalogue of these things. I ask you, do you really think that the present system of government of the industry does secure the maximum of efficiency?—I have already said in my evidence there is room for improvement, and mine owners should be compelled to arrange for collective production. I said some other things about it. I agree with you there.

16,217. If you agree so far, is there any reasonable hope of getting the maximum efficiency out of this complicated system, under which 1,500 companies are to remain in possession with all their officials?—We have not too many.

16,218. If there are few, it is not effective?—I do not agree.

16,219. And, in addition to that, the State is to have superimposed over all that muddle the Sanctioning Authority, consisting of members of both Houses of Parliament, which is to have connected with it a committee described in this paper as a stationary committee, but which has been amended here to-day and described as a peripatetic committee to advise it on some parts of the question?—I should like to consider the whole question of this Sanctioning Authority before I express an opinion.

16,220. Would it be better to take direct and effective control of this industry and work it with the best men we have?—I do not think so.

16,221. You prefer a more complicated system?—I prefer the present system, with more control.

16,222. With the triple management: first, the lessor (the real owner); secondly, the lessee (commonly called the coalowner); and thirdly, the State, clearing up the muddle?—Yes.

16,223. And you prefer that to a direct, downright, business-like management of the whole thing by a single organisation?—Yes.

16,224. Mr. R. H. Tawney: You used the phrase "collective production." Can you tell us a little more what you mean by that?—It was a quotation from Sir Richard Redmayne.

16,225. You mentioned certain passages to which you think it ought to apply; for example, pumping?—Yes.

16,226. Are there any others?—Ventilation.

16,227. And any others?—Those are the two principal ones, I think.

16,228. Forgive me if I ask an ignorant question. Do you mean a group of mines should be treated as a unit for the purpose of technical equipment?—Yes.

9 May, 1919.]

Mr. JOHN DAVID McLAUCHLAN.

[Continued.]

16,229. Suppose there is anyone, an owner or lessee, who does not wish to come into the group, what is it you propose?—I think he ought to be compelled to come into the group.

16,230. That there should be a public authority to compel him to come in?—Yes.

16,231. Do you conceive that public authority taking the initiative; that is to say, making a survey of the coalfields of the country and then arranging these groups—or would you wait until one party who was dissatisfied applied?—I think it would come from people interested; for example, like myself, and other people like myself; you would find suggestions being made by them.

16,232. You think it would be satisfactory for the central authority, however composed, to adopt a waiting attitude?—Yes, largely, I think.

16,233. To wait until some third person or persons applied for a scheme of reorganisation?—Largely, I think.

16,234. With regard to this unification, do you conceive it extending to matters of finance?—The cost of pumping, for example, would have to be shared in proportion to the output, or under some reasonable arrangement.

16,235. For example, we have been informed by some witnesses, I think the Inspectors of Mines amongst them, that the technical equipment of certain mines was considerably below the standard which might be reasonably expected?—Yes.

16,236. But that certain mines found difficulties in improving it because they could not raise sufficient capital. Do you suggest, under your scheme of unification, you should have what I may call financial unification to put capital at their disposal?—Financial assistance to a group.

16,237. Unification or assistance—one shades into the other; is that what you suggest?—I think that might do.

16,238. To the extent to which that takes place, you unify not only the management, but the ownership?—I do not think you do—not the ownership. I mean the same lessees would still go on working their own pits.

16,239. But to the extent to which you put a common fund at their disposal, you destroy their financial independence?—So far as that goes, you would, I suppose.

16,240. You make them financially to that extent a single concern?—Yes, to that extent you do.

16,241. Such action as that on the part of the State would presumably increase the value of these properties, would it not?—Yes, I think it would.

16,242. And at the same time it would involve the State in a certain amount of expense?—Yes, for which they would get a good return.

16,243. A good return in what?—The collieries would have to pay interest on the money advanced to them, I think.

16,244. I am afraid I do not quite follow?—If the State provide money to pump water, it would expect a return of interest on the money. Was not that your suggestion?

16,245. No. You touched upon it rather lightly. You contemplate the State advancing money to the lessees of pits?—I thought you meant that.

16,246. As a matter of fact, that is what I meant, but is it what you mean? You used the phrase "collective production"?—No, I did not think of that under collective production as mentioned in my proof.

16,247. You realise, so far as the State imposes this higher standard of operations on the mines, it increases the value of the property, does it not?—Yes, I think so.

16,248. And it does so at some expense to itself by creating a larger or smaller administrative machinery?—Yes. Of course, the State help might not be required, as the tenants might supply the money. It would be only in extreme necessity that the State would come in.

16,249. If the State is not required *cadit questio*: but I thought your paper proceeded upon the assumption that some external authority was needed?—Yes.

16,250. And the State would bear some considerable expense?—Yes, but I suggest the State would appoint a tribunal to enforce this collective production.

16,251. Yes, the State is going to impose this higher working condition at some cost to itself?—Not necessarily.

16,252. It will presumably employ some officers?—Yes, I suppose it would: I might be one myself.

16,253. I do not think anyone on the Commission would agree that Civil Service costs nothing, although I should be delighted to hear it did. To that extent it would put money into the pockets of private owners at some expense to itself?—It would.

16,254. What return do you contemplate it getting? It really means endowing the private owner?—In all mining you arrange a sinking fund to repay the capital expended, and there would be some interest, which might be small in this case.

16,255. That is not the question I was asking. What I am suggesting is that the State, on your theory, is going to improve these mining properties. Do you contemplate the owner of the property repaying something to the State?—It would have to come out of his profits.

16,256. You contemplate repaying the cost of it?—Yes.

16,257. On page 2 you gave some examples in which mineral owners have put down bores?—Yes.

16,258. We have heard some evidence as to England and Wales in which a witness said that it was rather unusual. Is it usual or unusual in Scotland?—I have some cases, beyond those I have mentioned, if you want them, where large sums have been expended.

16,259. I only wanted to know how far it was the rule and how far it was the exception?—I do not know really, but I know there are many cases where it has been done.

16,260. But you will understand that the significance of the cases depends upon whether they are common or very rare?—I cannot tell, and perhaps you can. I would not say they were very rare.

16,261. Are they common?—Yes, I think so.

16,262. Is it the general rule for the mineral owners in Scotland to take an active part in the exploitation of his property?—Not the general rule, because we have a great many small owners, and a great many who do not require it, and it is not suggested with regard to them.

16,263. In that case what does the mineral owner do?—He puts a bore down.

16,264. I mean in the other cases. You say the cases where he puts a bore down are the exception. When he does do that, what does he do?—Under what conditions?

16,265. What is his function in the industry? What is the service he renders? What is the contribution he makes to production?—Do you mean the owner?

16,266. Yes?—He is simply the proprietor of the minerals—that is all—and he sees the minerals are properly worked and developed to the best advantage.

16,267. You mean he leases his minerals to someone else to work them?—Yes, as a rule, because he is asked to do so.

16,268. On page 4 of your proof you deal with a subject of rather a different kind. For example, you give an account of the report of the German Socialisation Committee?—Yes.

16,269. Have you read that report?—No.

16,270. You know there were two reports, do you not?—I do not know that I do. It is simply a quotation I gave you, which you can get for yourself.

16,271. From what?—I took one of them from the London correspondent of "The Scotsman." It is perfectly true. Do you deny it is true?

16,272. No. I only wanted to know. The reports are accessible?—I am sure they are; and you know all about them yourself, I am sure.

16,273. I do not wish to press you about that, if you have not seen them. Did I understand you, in answer to a previous question, to suggest that in the case of an undeveloped mineral field, when it was a question of payment, the State should bore with a view to ascertaining whether there was coal?—I think

9 May, 1919.]

MR. JOHN DAVID McLAUCHLAN.

[Continued.]

my suggestion was that in the case of unproved areas, before the State took them over, it should put a bore or two down.

16,274. Do you contemplate the State bearing the expense of that?—Not if there was coal found.

16,275. But if there was not coal found?—They should bear the expense.

16,276. I may be ignorant of business, but is not that an unusual proceeding?—Yes, it is very unusual; it has never been done.

16,277. Is it not for the owner or vendor to prove the value of his article or of his claim?—Perhaps it is.

16,278. And not for the purchaser? In that case, would it not be reasonable for the cost to be borne by the owner and not by the State?—Perhaps it would.

Chairman: Mr. Herbert Smith has some questions to ask this witness, and I quite appreciate his point about this scheme. If I may say so, it is a good point. What I have done is I have got the first report of the Committee dealing with the Law and Practice relating to the Acquisition and Valuation of Land for Public Purposes, and I propose to circulate it now, and Mr. Herbert Smith will have an opportunity of asking questions with regard to it when we come back on Tuesday; but before I do that I will just draw attention to it.

Sir Arthur Duckham: I do not appreciate Mr. Herbert Smith asking the present witness about this matter when the latter knows nothing about it.

Mr. R. H. Tawney: He has been cross-examined upon it by other Commissioners pretty fully.

Sir Leo Chiozza Money: Is this the last report?

Chairman: This is the first report of the Committee.

Mr. Herbert Smith: You would not object to my going so far as Sir Adam Nimmo has gone?

Sir Arthur Duckham: No. I only want the truth.

Chairman: This appears to be the Report, and you will see on page 9 it says: "Our Committee was appointed by the Prime Minister in July, 1917—To consider and report upon the defects in the existing system of law and practice involved in the acquisition and valuation of land for public purposes and to recommend any changes that may be desirable in the public interest." Of course, I am not going to read all through this Report. No doubt, it is a very valuable Report. The Sanction of Parliament is on page 19, and I will read that. What is suggested is a Sanctioning Authority, apparently, to take land under the circumstances. It says: "As we desire the new Sanctioning Authority to be neither a Government Department nor a Standing Commission, but rather the analogue of a Parliamentary Committee, we consider that its personnel and general constitution should follow as closely as practicable those of such a Committee. In framing detailed proposals on this head, we have accordingly been mainly guided by the following general principles:—A. The Sanctioning Authority should consist of a panel of selected persons. It should not be limited to Members of Parliament, but should include others of similar standing, not being officials of Government Departments nor experts as such. Every proposal involving the compulsory acquisition of land should be referred to the Sanctioning Authority and (unless the application is unopposed and of a sufficiently simple nature to be dealt with by a direct order of the Authority after publication for a limited time) should be treated as follows:—(i) From the Panel one or more Commissioners should be deputed (as may be found necessary) to hold public inquiry into all aspects of the scheme. (ii) The public inquiry should in most cases be held locally. (iii) The decision of the Commissioners so deputed should be the decision of the Sanctioning Authority on the scheme. (iv) That decision should be published in an Order of the Sanctioning Authority, as soon as possible after the public inquiry, and should be final (subject only to a reservation of Parliamentary control over questions of policy as hereinafter provided). B. Parliamentary control and responsibility should be retained—(i) by making Parliament responsible for selecting the Chairman

and Members of the Sanctioning Authority, much in the same way as it selects the Chairman and Members of Parliamentary Committees; (ii) by reserving a right of appeal to Parliament on questions of policy." Now will you kindly go to page 7, because that is the easiest thing to look at. There you will see "Abstract of Contents." Section 1 is: "Demands on Land for Reconstruction Purposes. Need for Comprehensive and Simple System of Compulsory Acquisition." Section 2 is: "Sanction for Exercise of Compulsory Powers of acquiring Land for Public Purposes. Proposed new Sanctioning Authority." Section 3: "Constitution of the Sanctioning Authority." Section 4: "Machinery and Procedure for the Sanctioning Authority. Tribunal for Assessing Compensation." Section 5: "Work of the Sanctioning Authority. Applications for Compulsory Acquisition of Land on behalf of Local Authorities, Government Departments and Private Promoters." Section 6: "Constitutional Position of Sanctioning Authority summarised. Questions incident to Transactions in Land for Public Purposes other than the question of Compulsory Powers. General Conclusion and Summary of the Committee's Recommendations." Then, as I understand it, Mr. Leslie Scott's Committee made another interim report, which was circulated the other day. I think it is only right that Mr. Herbert Smith ought to have that, and in the meanwhile we will postpone his cross-examination.

16,279. *Mr. Robert Smillie:* I think I am right in saying that to Sir Leo Money you said that you worked for or were connected with a considerable number of Scottish mineral owners?—Yes.

16,280. Was he correct in saying about 100?—Yes.

16,281. About 100 different mineral owners in Scotland?—Yes.

16,282. What counties are they in?—Fife, Lothians, Lanarkshire and Ayrshire.

16,283. The whole of the coalfields of Scotland?—Yes.

16,284. How many assistants do you say you have?—Four at present.

16,285. And you do the surveying for 100 mineral owners?—Yes; we do not survey for them all.

16,286. How many do you survey for?—I cannot tell you at the moment. Whether we survey or whether we do not survey, we get the plans into our office regularly. In some cases the coal owners keep surveyors themselves who survey the working.

16,287. I understand you are acting in the interest of the mineral owners?—Yes.

16,288. How many collieries are covered by these 100 mineral owners?—A lot of them are small ones, and one colliery does for them.

16,289. One colliery will do for one owner?—No; one colliery works for several owners where they are small.

16,290. Where is it that one colliery is working out several owners' coal?—Take Preston Links, of the Summerlee Iron Company, and a number of the Fife Companies' pits work for several owners. It is quite common.

16,291. Would that make it all the more difficult when you have your survey or examination in a case of that kind to make sure that you are protecting your owners?—I only protect the mine owners.

16,292. I mean protecting the different owners whose interests you are serving. If there were six different owners in one colliery, would you not require to protect each of the six if you were employed by the six?—Yes.

16,293. That would be more difficult than if it were owned by one?—Yes, it would be.

16,294. How often do you really make a survey in a case of that kind? Is it quarterly?—Quarterly. We must do that by Act of Parliament.

16,295. Could you and two assistants complete your survey and examination of, say, 70 collieries in a year?—Yes, we do it.

16,296. How long does it take you to survey a colliery with two or three seams and perhaps employing 1,500 men? What would be approximately the time?—Perhaps a week.

9 May, 1919.]

MR. JOHN DAVID McLAUCHLAN.

[Continued.]

16,297. For one colliery?—Yes. May I say this, that there are very few collieries that I have to do with, that do that.

16,298. As a matter of fact my point here is that you put it down here and perfectly distinctly, that you knew that there was no coal being lost in those mines. That was your point, was it not?—That I knew there was no coal being lost?

16,299. Yes?—That is my opinion at all events.

16,300. But you base it on the fact that you, as the owner's representative looking after his interests, knew it from the plans?—Yes, you can check it and no one denies that.

16,301. But you are a theoretical man and a practical man. Do you know whether coal has been lost?—I do not know that it has been lost.

16,302. Do you know the Bog Colliery, Larkall?—Yes; I have been there.

16,303. Do you know surveyors were appointed by the Duke of Hamilton to do surveys such as you do to protect him?—Yes.

16,304. Are you aware that tens of thousands of tons of coal were lost in that Bog Colliery?—How do you mean lost?

16,305. Lost by being left in the waste?—They are not lost; they can be taken out to-morrow.

16,306. I beg your pardon?—And I beg yours.

16,307. It cannot be got to-morrow?—It can be done soon.

16,308. It is enclosed for half a mile, and it would cost a thousand pounds a ton to get it to-morrow?—These were left to keep up the low-lying lands either side of the Clyde.

16,309. It was not, I suggest?—I say it was.

16,310. When a pillar was half taken off and the weight came, they drew the wood and let it in, did they not?—One pillar.

16,311. No, hundreds of pillars were half taken out and left in, and there were surveyors going there, and they would swear there was no coal lost because they did not know?—I do not know; I cannot tell you.

16,312. What could be done in the case of the Duke of Hamilton with the ablest surveyors in Glasgow can surely be done in your case. I know that from practical experience?—What could the State do to prevent it?

16,313. You are making out that under private ownership there is no loss of coal in the mines of Scotland which has been unnecessary?—"Unnecessary" is the word.

16,314. And you know that is the case in cases under your own supervision, because you visit every quarter, but they could lose a thousand tons of coal from the time you were there in one quarter, as you know?—How could they do it? I do not know that.

16,315. I tell you here now in the presence of engineers that you cannot tell from the plans whether they have taken out all the coal?—I think I can. We just disagree. That is all about it.

16,316. You say there are greater difficulties in Scotland than in England?—Yes, in some ways.

16,317. Arising from faults and other things?—Yes, we have more of those things in Scotland than in England.

16,318. Are you aware that the output per man in Scotland is higher than the rest of Great Britain?—Well done, Scotland, I say.

16,519. Are you aware of that?—I am not at the moment.

16,320. You are not aware that the output per man in Scotland is higher than in other parts of Great Britain?—I am not at the moment. I have not it in my mind at the moment; probably it is right.

16,321. Are you aware that the output per man in Lanarkshire is the highest in the Kingdom?—I am not, but I am prepared to believe it.

16,322. Will you take it from me that it appears in the Reports?—Certainly.

16,323. Is it not the fact that the introduction of coal-cutting machinery into Scotland has enabled them to work more than otherwise would have been possible?—Yes.

16,324. They are working at the present time very thin seams?—They are.

16,325. Which could not have been worked out by hand working unless the price of coal had gone up enormously?—Yes.

16,326. Is it not a fact that many thin seams were left in in years past because they had not such a thing as coal-cutting machinery, and it did not pay them to work it out?—Why should they work thin seams when they have thick ones?

16,327. That is what we object to. You work the best and leave the worst.

16,328. But they could not do it. A lot of these thin seams, of course, are a very fine quality coal.

16,329. Whether you do so or not we look upon that coal as a national asset and say that the coal ought to be left to stand between the nation and the future, but if it is left in this way it cannot be?—But it is not going to be left in.

16,330. But it has been?—Yes, but you cannot take all the coal out in a week. You must leave some in. You cannot be at it all the time.

16,331. Is it not the fact that in Lanarkshire you had nine feet to work and you left three feet?—Are you referring to the upper Ell coal?

16,332. Yes, are they not working the Ell coal? They are getting a little bit here and there?—The upper Ell coal is being worked now.

16,333. I put it to you that the upper portion has all fallen into the waste and they get a little bit at an enormous cost. I put it that under State management it would have been worked at the time?—Why do you say that?

16,334. Because I know?—Tell me why.

16,335. Because we have not State management.—I do not believe State management would have done it.

16,336. But I can say it was a wasteful method of working?—I do not agree and I am giving you my opinion. It is done all over the country. If a thick seam has a bad roof there are often one, two, or three feet left on it in the first working, supporting the roof. If you tried to work it all you would lose far more.

16,337. Did you ever work at the Ell coal in Lanarkshire?—No.

16,338. Did you get it at the face?—No, I never got it at the face.

16,339. What happened to the work in the Ell coal and the other seams? I venture to say I know more about the working than you?—Very likely.

16,340. I say it was possible to work the full thickness?—Then what was the object of leaving it behind?

16,341. It was deliberately left behind.—Why?

16,342. Because it was thought six feet was enough to work at the time and that was where the roof was good and strong.—It is very extraordinary. All I can say is that it is quite incredible.

16,343. I only wanted to put the question in regard to your statement that you know, as a surveyor, and your assistants knew, whether there was coal being lost. You did not know and it was impossible that you should know.—I do not see your argument.

(The Witness withdrew.)

(Adjourned to Tuesday morning next at 10.30.)

13 May, 1919.]

MR. CHARLES EDWARD RHODES.

[Continued.]

SECOND STAGE—ELEVENTH DAY.

TUESDAY, 13TH MAY, 1919.

PRESENT :

THE HON. MR. JUSTICE SANKEY (*in the Chair*).

MR. ARTHUR BALFOUR.

MR. ROBERT SMILLIE.

MR. R. W. COOPER.

SIR ALLAN M. SMITH.

SIR ARTHUR DUCKHAM.

MR. HERBERT SMITH.

MR. FRANK HODGES.

MR. R. H. TAWNEY.

SIR LEO CHIOZZA MONEY.

MR. SIDNEY WEBB.

SIR ADAM NIMMO.

MR. EVAN WILLIAMS.

SIR RICHARD A. S. REDMAYNE (*Assessor*).MR. ARNOLD D. McNAIR (*Secretary*).MR. GILBERT STONE (*Assistant Secretary*).

MR. CHARLES EDWARD RHODES, Sworn and Examined.

16,344. *Chairman*: I believe you are a mining engineer and have been engaged in mining for 54 years, and have been in practice as a mining engineer for upwards of 46 years?—Yes.

16,345. Are you intimately acquainted with the coalfields of South Yorkshire, Nottinghamshire and South Derbyshire?—Yes.

16,346. Have you had a very wide experience in connection with mining royalties, and have you made exhaustive enquiries and obtained much information for the Royal Commission on Mining Royalties when that Commission made their report, which was issued in 1893?—Yes.

16,347. In addition to acting for a large number of royalty owners, are you consulting engineer for many colliery companies, the output from which in the aggregate is about 13,000,000 tons per annum?—Yes.

16,348. Are you also a director of a number of collieries, and also of iron and steel works and by-product works?—Yes.

16,349. Those being your qualifications, I will now ask you to be good enough to read your proof, beginning at paragraph 4.

"4. In the major portion of the coalfields I have mentioned above the average royalty is about 5d. per ton. In the more recently-developed areas round Doncaster, however, and to the west thereof the average royalty is less, and I estimate it at under 4d. per ton.

Underground wayleaves throughout South Yorkshire are comparatively rare, and in the newer leases free underground wayleave is invariably granted. Surface wayleaves are still more rare. Where wayleaves are payable under some of the older leases, they represent a very small charge, but, as I have said, wayleaves are few and far between. The clauses in the leases now granted relating to the allowances for bad coal are much more liberal to the lessee and fairer generally than they were 25 years ago. I have advocated for many years that it is right and proper that a tenant or lessee should be released from paying for coal which it is impracticable for him to work owing to its geographical situation, physical conditions, or by reason of it becoming too thin or of too poor a quality to make its working a commercial success.

5. Allowance clauses and many other clauses embodied in modern leases are now quite reasonable in their terms, as is the right given to lessees to break or terminate the lease if the undertaking cannot be carried on without loss.

6. I am in favour of the standardisation of leases as far as practicable, and think that there should be no difficulty in having a common form of lease applicable to each different coalfield in the Kingdom. The modern form of lease in South Yorkshire is the result of long experience and embodies all that is equitable amongst fair-minded men, and it constitutes in effect a standard form of lease.

7. The conclusions of the Report of 1893 are well known to me, and, speaking generally, I am convinced that it cannot now be said that the royalties in Yorkshire, Nottinghamshire, and North Derbyshire have in any way materially handicapped or interfered with the full development of these coalfields. I certainly admit that there are and have been cases where through an unreasonable attitude by a lessor smaller coal areas have been held up, and, though these cases are very few and far between, I am of opinion that it is desirable in the nation's interests that machinery should be established whereby compulsion could be applied to deal with cases of unreasonable conduct by owners. The same machinery could deal with all the existing defects of private ownership.

8. I am a member of the Committee appointed by the Ministry of Reconstruction to report on the acquisition of land for public purposes, including rights and powers in connection with mines and minerals. That Committee has drawn up an Interim Report, which is dated the 18th March, 1918, and has been placed before you. I believe that that report deals with all the existing defects of private ownership, and, if adopted by the Government, I am of opinion that it would meet all difficulties which now arise under the present system of individual ownership, such as they are, just as effectively and without the drawbacks of State ownership.

9. If in accordance with the report referred to statutory powers are conferred on the Home Office and the Sanctioning Authority, and a Mining Department

13 May, 1919.]

MR. CHARLES EDWARD RHODES.

[Continued.]

with an Advisory Council (including representatives of the workers) is established, the present situation would then be made in all ways satisfactory, and in my opinion could not be improved upon in the public or national interest.

10. My experience has proved to me that it would be a national misfortune if the mining industry was closed to private enterprise. The initiative of such men as the late Sir Arthur Markham and others has done great things in bringing about the large measure of success which I am convinced the nation has enjoyed from the coal trade of the country. Boreholes to prove unexplored areas have been put down in all directions by private enterprise. Earl Fitzwilliam bored to the coal to the deep of Doncaster, and that coalfield is now being developed. Many other boreholes have also been put down by royalty owners themselves and by prospective lessees. In some cases those borings or exploitations have been a success, in others the money so expended has been wasted. The result generally, however, of these borings has been the new developments of large areas, and prospective developments of further large areas between the towns of Bawtrey and Doncaster, and to the north of the latter town, and but for the war operations would have been much further advanced. The areas of coal taken up by various companies range from 5,000 to 15,000 acres, and are compact in shape, arrangements having been made for give-and-take lines between the various coalfields with the object of rounding them off. I fail to see how State ownership could have done more than has been done by private enterprise either in dealing with royalties or the development of mines. In some cases royalty owners have assisted their lessees when they have been in difficulties by the suspension wholly or in part of the minimum rents, and in some instances the rents have been altogether suspended on the understanding that the amount of money represented by such suspension should be expended in proving faults or driving through barren ground. In other cases, half royalty has been allowed in order to induce lessees to drift to areas which have been cut off by large faults, or the thinning out of the seam. I have known owners in some other cases help their tenants with advances of cash, for instance, Lord Crewe lent his lessees upwards of £22,000 to help them when in difficulties, and Mr. Wentworth gave similar assistance to his tenants. In fact, speaking generally, large lessors have been ready to assist their lessees whenever difficulties of an exceptional character have been encountered.

11. State nationalisation of mines would, in my judgment, be detrimental to the nation. It would mean the creation of a huge monopoly; individual effort and initiative would almost, if not entirely, disappear; and there would not be any check on the price of coal to the general community, as the incentive to practise economy which now follows private enterprise would to a great extent disappear. Nor would the State obtain the best brains for the development of the industry. Large financial risks are inseparable from the exploitation of new and unproved areas. During the past twenty years I have had a good many instances where enormous sums of money have had to be spent owing to the shafts being put down in a position where when the coal was reached it was found to be cut up by faults and dislocations. At Yorkshire Main Colliery, near Doncaster, one shaft struck the Barnsley seam, to which it was intended the shafts should be sunk, and the other shaft struck another seam, the two shafts being divided by a large fault. Some years of exploration took place, costly drifts have had to be driven, and a very large sum of money has had to be expended and much valuable time has been wasted before the colliery could be put into a position to pay its way, and had it not been for the backing of a strong and important company it must have resulted in a very large sum of money, running into hundreds of thousands of pounds, being lost to the original shareholders. At another large colliery, close to where the shaft struck coal, which was found to be of fine quality, a washout was discovered, the coal thinning down to little

over one foot in thickness, a large area being denuded of workable coal and for a very considerable number of years this colliery was handicapped by having to drive roads in all directions through this washout area, no dividends were paid, and although now it is a financial success, the original shareholders were for many years without any return for their expenditure. I could amplify these cases, but I think instances I have given are sufficient to show the highly speculative character of any enterprise in coal, whether looked at from the point of the lessor or the lessee, and that the State would be unwilling to embark on similar enterprises. The difficulty of obtaining the sanction of the Treasury to the expenditure of large sums of money in such hazardous enterprises is obvious.

12. Another point I have been asked to consider is, in the event of the country deciding to nationalise, what would be a fair compensation to be paid for the interests acquired. My views are as follows:—

Each separate royalty ownership should be valued independently, and it would be quite impossible with fairness to adopt the proposals set out in the essay issued by the Fabian Society entitled "The Nationalisation of the Coal Supply." My reasons for insisting on separate valuations may be shortly stated as follows:—

- (1.) The rate at which the minerals will be worked must be the basis on which any valuation can possibly be founded to get at the present cash value, and therefore every royalty must be valued separately.
- (2.) One royalty may have been worked to its full capacity for, say, ten years, and yielded, say, £3,000 a year, but it will be exhausted in five years more. Another royalty has only just begun to be worked, and has produced, say, £500, £800, and £1,200 per year for the last three years, but it will now yield £3,000 a year for twenty years. To get at the fair value, each of these royalties must be dealt with separately.
- (3.) To take an average over the whole country of so many years' purchase would give undoubtedly an approximate estimate of the value of the royalties considered as a whole, but it cannot be applied with fairness to all estates alike.

13. I have considered the evidence already given by Mr. W. Straker and by Sir Richard Redmayne. There are many things which I think have been somewhat exaggerated

(1.) PROFITEERING.

Prior to the boom which commenced in the early 'seventies trade was at its lowest ebb, wages were very low, and the price of coal did not average much more than 4s. per ton at the pit's mouth, and no profits were made in the districts I am acquainted with, but an extraordinary trade boom set in and in consequence of the demand very much exceeding the supply prices rapidly advanced, and large profits were undoubtedly made, the result being that collieries were disposed of at high prices and new ventures were started. The boom, however, collapsed almost as rapidly as it had grown, and large sums of money were lost by investors who had embarked in coal shares and the exploitation of new ventures. The boom, as I have said, caused new undertakings to be embarked on, and the supply rapidly overtook the demand, until in 1877 collieries were only working half-time and gave no return to their shareholders, and wages had again reached a low figure. This condition of things prevailed until 1889. No new developments were undertaken, and it was a period of stagnation. But another spurt in trade took place in that year, and from working at a loss, or no profit, collieries began again to make considerable profits, which condition of things continued for about two years. Then there was another slump, followed in 1893 by the disastrous strike of miners in connection with a demand from the owners for a large

13 May, 1919.]

MR. CHARLES EDWARD RHODES.

[Continued.]

reduction in wages. This strike resulted in a settlement known as the Rosebery Agreement, but coal still continued at a very low figure, and only the best collieries could show a profit. In 1899, however, another revival in trade took place and very considerable profits were made, and although there was a falling off in 1906, 1907, and 1908, the coal trade has been more prosperous since 1900 than in the whole of its history, but during the period I have reviewed there was never any profiteering, as such—it was simply the law of supply and demand—and as soon as over the demand fell off the price of coal as a rule fell more rapidly than it had risen.

(2.) LOSS OF SMALL COAL LEFT UNDERGROUND.

Speaking of Yorkshire and Derbyshire, up to a few years ago there was no market for the small coal produced at the collieries working the Top Hard, Barnsley Bed, and other coals, which was non-coking, and a good deal of small coal was undoubtedly left in the pits, most of the collieries filling the coal with either riddles or forks; but in recent years, mainly on account of the introduction of coal-washing machinery, the small coal can be now so washed and cleaned that it is sent away with the large coal, the prejudice against small coal for boiler firing and other uses having largely diminished, and at the present day forks and riddles have almost entirely disappeared from the collieries in the districts under review, the coal being filled with shovels, and very little if any small is consequently left in the pit; in fact, there is no inducement at the present time to leave any in the pit, as the collier is paid the same rate for the small coal as for the large.

(3.) LARGE COAL LEFT IN THE PIT.

This is a matter which can only be determined by the circumstances of each colliery, having regard to the character of the roof, and of the seam itself, but it is obviously to the interest of both lessor and lessee to work as much coal as they can, and I fail to see how nationalisation of mines could do more in this direction than private enterprise has done.

(4.) SAVING IN RETAIL DISTRIBUTION.

It seems to me that this can be done now by the Corporations or Councils buying all the coal required for the needs of their communities and distributing it to the best advantage, buying in the cheapest and most suitable markets, running their own wagons, and distributing the coal from stations most economically situated for the needs of the neighbourhood."

16,350. Do you propose to make these corporations or councils acquire siding accommodation at the stations for the purposes of distribution?—They would have, undoubtedly, to do that or take the present means of sidings and methods of distribution.

16,351. A corporation would have to be the owners of the wagons and the lessees of the sidings?—Yes.

16,352. Have you any idea as to what the expense would be?—I have not. At the present time these various towns are served through various sidings, and by means of distribution through coal merchants and the like, and I presume the same means would be available for the corporations if they took them over.

16,353. Would you leave the present distributors to go on just in the same way, side by side with the corporation distributor?—I should say if the corporation undertook its own distribution, it would do away entirely with what is now termed the middle-man.

16,354. What about the small man who buys and sells coal? Would the corporation do the hawking of coal?—I presume they would, if they deal with the distribution of it to the whole of the community. They would have their own carts, for instance.

16,355. The councils or corporations would have, first of all, to have railway wagons, then to be lessees of sidings, and then owners of carts and horses for distribution?—Yes, or they could hire the railway wagons from the colliery companies, and they would have the same means of sidings as are now available.

16,356. Take a place like London, which has a great number of different authorities. Do you propose that the London County Council should do it, or the borough councils?—That is entirely a question for consideration.

16,357. I thought, perhaps, that you had thought of these things?—No.

16,358. Will you continue reading your proof?—

" (5.) BARRIERS.

The whole question of barriers is a complex one, and each set of circumstances must be examined and taken into account before condemning past or present management.

In practically every district the working of the minerals commenced at the outcrop, and the shallower areas were first worked. Any surface water which was encountered flowed into these workings and was pumped at various points from the deepest part of the workings from pumping stations suitably situated, the water being gathered to these pumping stations by levels.

Now sinkings took place further to the deep, and as a rule the water was tubbed back in the shafts themselves in order to avoid the expense of pumping, and having gone to this outlay, lessees naturally asked for the right to protect their workings by leaving barriers to hold up the rise water I have described.

No system of State ownership could have avoided the risk of flooding the deeper mines except by the leaving of a barrier.

There is no doubt that assuming an entirely new coalfield was being developed arrangements could be made by laying out water levels where water had to be contended with which would reduce the amount of coal necessary for barriers.

BARRIERS AND VENTILATION AND SAFETY BETWEEN MINES.

Down to a certain depth some barriers of coal are necessary, apart from the water question, in order to keep the ventilation of collieries separate, and no system of State ownership could obviate this necessity, but at the same time it is obvious that the larger the area that can be worked to one undertaking the less the proportionate area of barriers would be.

At great depths, in many cases we are now abandoning the practice of leaving coal barriers and instead are leaving "pack" barriers, where the local and physical conditions render that practically possible. By a "pack" barrier I mean an artificial barrier constructed of waste removed when working the pit.

The loss of coal left to form barriers could be minimised as far as is practicable, having regard to the matters I have discussed, by the adoption of the recommendations of the Report of the Acquisition and Valuation of Land Committee to which I have already referred."

16,359. *Mr. Herbert Smith:* In paragraph 3 of your proof you say: "I am also a director of a number of collieries and also of iron and steelworks and by-product works." Will you tell me what collieries you are a director of?—Brodsworth, Bullcroft, Hickleton, Hodroyd, Llay Main, Manvers, Markham Main, Mouckton, Staveley, Yorkshire Main. I think that is about all.

13,360. I take it you firstly give evidence that you are opposed to the nationalisation of minerals?—Yes.

16,361. That, secondly, you are opposed to the nationalisation of mines?—Yes.

16,362. And, thirdly, you are here to show that the industry should be a matter of private enterprise?—Yes.

16,363. With regard to distribution, I think you agree that there is need for some modification in that?—Yes.

13 May, 1919.]

MR. CHARLES EDWARD RHODES.

[Continued.]

16,364. I see in your paper that you quote Sir Arthur Markham. We knew him fairly well in Yorkshire, and I will quote him now against royalty owners, because you are here to defend royalty owners, as I understand, under present methods. Do you know that Sir Arthur Markham in 1900 said that at Hickleton Main Colliery they took a risk of £500,000 in sinking and equipping the mine and building a model village, and that he said before they reached coal they were paying £18,000 a year dead rent? Do you agree to that?—I think it was Brodsworth.

16,365. He names them both?—At Hickleton it was not the case.

16,366. He says that before the mines had reached their full output or got practically any coal at all they were paying the landlords £18,000 dead rent?—That did not apply at Hickleton, but I daresay it would apply at Brodsworth.

16,367. He goes on further to say: "Now that they are fully developed they are paying from £35,000 to £45,000 a year royalties"?—Well, they are not paying that at Brodsworth.

16,368. I am speaking now of Hickleton and Brodsworth jointly?—They will not be paying that much.

16,369. So that his statement would not be true?—I think there must be some other collieries included, and I will tell you why I say that. It is because the royalties average 6d. per ton at Hickleton, and they average rather less at Brodsworth, namely, about 4d., and they raised at Hickleton before the war over 1,000,000 tons a year, and they got about 1,200,000 tons a year at Brodsworth. That is the way in which I arrive at the figure they would be paying when they were fully developed.

16,370. They are his figures, and he gave them, but they are not only that because a royalty for bricks is charged and also surface rent £4 an acre, and ground-rent at about £660?—Yes.

16,371. Do you agree with that?—I daresay the figures are quite correct.

16,372. And he says prior to these collieries going down that land would be worth between 10s. and 15s. an acre?—I do not know what the letting value of it was. I should have thought it would have been worth a bit more than that, but not very much.

16,373. And still you agree that this ought to be in private owners' hands, and without any risk at all to them they should draw this large amount of money?—Yes, subject to the institution of some Court where the terms of the owners could be revised or there could be prevention of undue exploitation of the industry.

16,374. Do you agree further with the statement he made in 1906, when he said that at certain collieries that he had to deal with (he is now talking of Wales, because he was a colliery owner in Wales) they paid £17,460 in royalties to the landlords, and the landlords paid out of that £872 13s. in income tax, and the colliery company had to pay in local rates, etc., £5,613 14s. 6d.?—Yes.

16,375. Since then there has been another tax put on?—Yes.

16,376. Still, you agree with this method of private enterprise and royalties?—I agree that, as long as a reasonable rate is paid for the coal, whether it is payable to the State or private ownership, it is only right that it should be paid, as long as it is a rate which does not handicap the industry.

16,377. In your Doncaster area am I right in saying that at certain of your collieries, and at one colliery in particular, they charge £24 16s. 11d. per acre for land which was close to the town, and when the colliery company wanted to work it for colliery purposes it went up to £286 to the colliery owners, in addition to the royalty?—I do not quite follow. Was that for the sinking of a shaft?

16,378. No, simply to put the débris on?—I did not know of that.

16,379. But you know whenever a colliery is developed it increases the rateable value?—Undoubtedly.

16,380. And that without the royalty owner doing anything to increase it?—That is so, except to the extent of working his coal.

16,381. Except to the extent he allows us to work his coal which he claims?—Yes.

16,382. In your *précis* you name two gentlemen and you mention Lord Crewe first of all. Will you give us the name of the colliery where he lent that £22,000, because I happen to know of two collieries which had to close because they could not pay the royalties?—I am informed it was the Fryston and Wheldale Collieries.

16,383. But do you know whether he lent it on loan and he got it back with interest?—I do not know the details. I have simply been told.

16,384. No one would object to lend £22,000 on good security at interest, would they?—No.

16,385. Will you tell us where Mr. Wentworth gave assistance? Was it some small pits?—I understood he assisted them at Strafford Main.

16,386. Am I right in saying that the first boreholes put down between Cadeby and Southcarr were put down by Mr. George Dunston?—Yes; I advised him, and it proved the coalfield.

16,387. Yes. Was the coalfield 14 miles away from Cadeby?—Yes.

16,388. So that he was the pioneer of the coalfield in testing that coal?—Yes, in conjunction with the late Mr. Arthur Wilson, of Wilson & Sons.

16,389. That is right. That was put down in 1893?—Yes.

16,390. And they found the coal at about 1,000 yards deep?—Yes, 1,050.

16,391. It was found there was another seam?—Yes; they proved two seams.

16,392. And they leased the coal?—I do not know that they ever leased it. Mr. George Dunston had a considerable area of his own there.

16,393. Of course, if Mr. George Dunston is asked to give evidence here he will be able to tell us as to that?—Yes. He did a great deal to assist the development.

16,394. I think he was the main man to keep hammering away at the Doncaster Coalfield?—Yes.

16,395. If any credit is due, it is due to him?—I think a great deal of credit was due to him.

16,396. Now, coming to the nationalisation of mines, you tell us in your paper that you do not think the State would be able to obtain the best brains for the development of the industry. Why do you say that? Why would it not be able to obtain the best brains?—I think that in all probability it would be so managed by the State that there would not be the same competition, and the mining engineers of the country would not have the same opportunity of showing their ability as they have by working for private enterprise.

16,397. Do you know any mining engineers that would object to give the State the benefit of their brains if they paid them for it?—No.

16,398. So that they would be able to get as good brains as anyone else if they paid for it?—Yes. But they would not have the same opportunity of seeing what one man was worth as compared with another man.

16,399. Will you tell us why, because you have had a wide experience? You have made your way by your own energy, and I must give you credit for that. Will you tell me why they would not have the same opportunity?—I think that where you are in the position to compare costs between a number of collieries, one with another, and you find that working the same seam one colliery's costs are very much higher than another colliery's costs, you would naturally begin to enquire why it is. You take the physical conditions and you examine into those. You see what the method of working is which has been adopted, and you see that one colliery has been a success where another has been a failure, and eventually you find

13 May, 1919.]

MR. CHARLES EDWARD RHODES.

[Continued.]

out that it is due to the way in which the colliery has been laid out initially and the way in which it is being carried on. For instance, the success of some of the collieries in Yorkshire has been entirely due to the way in which they have been laid down, whereas others are failures.

16,400. Would not State payment enable the same thing to be done?—There are a number of collieries of which you are a director, and these collieries vary?—They do.

16,401. Some of these collieries would not have shut up if you had not looked after them?—I should not like to leave them at that.

16,402. Will you tell me what would prevent the Government, if they nationalise, doing that and enquiring at the various collieries, if there were any, the reason why they are not paying?—I do not see why the Government should not enquire into it, but I do not think they would be able to enquire into it to the same extent that a man enquires into it whose last shilling is dependent upon seeing whether he can get something out of his pit or not.

16,403. May I take it you have not changed your opinion even after being on two Committees? I see that on the Coal Conservation Committee you yourself, Sir Adam Nimmo, and Mr. Forster Brown, all three gentlemen interested in coal, signed this Report, saying: "We consider it necessary, therefore, that we should sign the Interim Report now submitted, and express the view that we are opposed to any State control over the mining industry in respect to its commercial and industrial interests"?—Yes.

16,404. That was a Minority Report which you signed along with Sir Adam Nimmo and Mr. Forster Brown?—That is so.

16,405. And you have not changed your opinion yet?—No.

16,406. It is quite true that there were two Minority Reports, were there not?—Yes.

16,407. I think Mr. Smillie signed one in favour of State ownership?—Yes.

16,408. Then you went on to another Committee and you took up a similar position. That was a Committee on which I think Labour was not represented?—I think Mr. Walsh was there. I was not particularly anxious to be on one Committee or the other. There was a great deal of time lost over them.

16,409. He is not mentioned in the Preamble or elsewhere as being appointed?—I rather think he was on it.

16,410. Am I right in saying that on that Committee there were, interested in mines, yourself, Mr. Forster Brown, Sir Thomas Ratcliffe Ellis, Sir Adam Nimmo, and Mr. W. Middlebrook?—Yes. So far as Mr. Forster Brown, Sir Adam Nimmo and I were concerned, I think we were invited to come on later.

16,411. Now, in the Report of that Committee you make certain proposals because you were satisfied that there were some difficulties that wanted dealing with and you proposed to set up a tribunal?—Yes.

16,412. If it is not going to stop private enterprise why should the State be called upon to set up any tribunal?—There were certain questions submitted to the Ministry of Reconstruction and the Committee was asked to report on these questions and to find the best way, in their judgment, of dealing with the points raised by the questions, and the result of our meetings was the Report which you have before you. We recognise that there are cases where the nation has been handicapped to some extent by the action of individuals and where there should be some means of preventing anybody holding up anything that is for the benefit of the community, either for his own purposes or through any other reason.

16,413. Does that apply to Government control during the war?—I do not think so; I should not like to say so.

16,414. If private enterprise can do all it wanted why should the Government control these mines during the war and still control them?—They did not control them so far as management is concerned in any way.

16,415. But the difficulty was that you were always complaining that they did control them so far as management was concerned?—They have never controlled so far as management was concerned in any pits I have had to do with; but they controlled timber and material to such an extent that we found it difficult to carry on, and we were handicapped in carrying on the outputs in consequence. In connection with that I should like to say that the Manvers Main which was producing one million tons a year before the war, during the last two years of the war produced 1,600,000 tons and the Government got the whole benefit of that both with regard to excess profits and everything else.

16,416. Is not the reason you are opposing nationalisation of mines because there are so many who are doing well under private enterprise?—There is no doubt we all take a somewhat personal view of these questions, and one is interested in the coal trade, and there is no doubt we all benefit by it, or we should not carry it on.

16,417. I think no one can doubt that the Carlton Main has been a good paying concern?—No.

16,418. They would not say the Wathstone Main was not a good paying concern?—It was a very bad paying concern for a great many years.

16,419. But for a great many years it has been a good paying concern?—Yes.

16,420. I know one man who invested £1,000 in it, and while he was in it he never drew less than 10 per cent. and he was able to sell his one thousand shares for £5,000. That would be a good investment, would it not?—Yes. I have not been able to sell my own at quite as much as that.

16,421. I think you will admit that Manvers Main was a good paying concern and is yet?—Yes. But in connection with that it must be remembered that that colliery started so far back as 1869 and it started with a small capital. They had the benefit of the first boom in 1872 and they used the money which that boom produced to a great extent in sinking their second pit, so that for a great many years they kept their capital down by doing all the development out of revenue and during the last twenty years the shareholders have undoubtedly reaped very large returns.

16,422. And they have sunk another pit during that time out of profits, have they not?—Yes.

16,423. It has been an extraordinarily good paying concern, has it not?—Yes.

16,424. The Hickleton Main will be a good paying concern, will it not?—Yes.

16,425. Will the Brodsworth Main be a good paying concern?—Yes. We have spent a large amount of money on Brodsworth, chiefly in cottages.

16,426. I think Bullcroft Main will be a good paying concern, will it not?—Yes.

16,427. What is the distance between Bullcroft and Brodsworth as the crow flies?—I should think it is about two miles.

16,428. There are two shafts down at Brodsworth and there are two shafts down at Bullcroft, are there not?—Yes.

16,429. What would be the Brodsworth area?—The Brodsworth area is, as nearly as possible, 7,500 acres.

16,430. What is Bullcroft?—Bullcroft has a very large area undeveloped and unsunk to, and taking that into consideration I should think Bullcroft control altogether about 15,000 acres.

16,431. When it was sunk what area had they?—I think they had an option over the whole area, but I am not certain. They would sink to at least five thousand acres.

13 May, 1919.]

MR. CHARLES EDWARD RHODES.

[Continued.]

16,432. And there are four shafts within two miles as the crow flies?—Yes. Of course the Bullcroft shafts were sunk nearly to their boundary owing to the speculative character of the coal going in an easterly direction and consequently those shafts were rather nearer together than otherwise would have been the case.

16,433. Am I right in saying that if Brodsworth works out to its full extent it will go more than two miles in another direction?—No, we are going to sink another pit.

16,434. At present it would go more than two miles?—Yes. If worked to the existing shafts.

16,435. And Bullcroft would go more than two?—Undoubtedly, unless they sink further shafts.

16,436. Is that your economical idea in private enterprise, to put down four shafts within two miles and cause men to walk two miles out and two miles in when the shafts could have been better adapted to put the men nearer to the work?—You mean if it were an amalgamated concern and if the two had been together?

16,437. Yes. They are largely amalgamated, and they are largely the same directors, are they not?—Yes.

16,438. And the consequence is that those shafts have been put down badly with regard to situation?—Undoubtedly you would have to put your Bullcroft shaft further away to the east if you had a free hand, but in any case they would have been put down further to the east unless it had been for the very speculative character of the coalfield in the easterly direction. As you remember, some boroholes were put down and that determined to a great extent the position of the Bullcroft shaft.

16,439. The reason I ask you is this; a statement was put in by the owners showing the distance the men travelled, was it not?—Yes.

16,440. And that showed that in South Yorkshire the men travelled three miles and over in and three miles out—six miles a day?—Yes.

16,441. And were riding a larger number of men to their work than any coalfield there is in Great Britain?—I think that is so.

16,442. You would not call it up-to-date mining, would you, to compel men to walk two miles in and two miles out?—No, but there are, as you know, reasons for it. Take, for instance, the Aldwarke Main. There we are cut off by a large fault, as you know, and we sunk a pit to let the men down.

16,443. But as a matter of fact at the Aldwarke Main you ride some of the men in?—Yes, and we have arranged to ride them in still further, and we ride them in and out at Roundwood.

16,444. May I put it that we are behind the times with regard to men travelling in and out in Yorkshire?—You are, and for this simple reason. The great bulk of the collieries are endless-rope-haulage. There is no other road in or out in most districts except the return, and there has been never any arrangement made for riding men in and out in the return.

16,445. Am I right in saying that when we attempted to get better facilities and wider roads and return air-ways and intakes, we were opposed by the colliery owners in the House of Commons on the ground that it would be an unnecessary expense?—I do not know about that. I never opposed it.

16,446. I am not speaking individually because I have too much respect to speak individually. I am speaking collectively. Is it not the fact that it was opposed at every turn which was possible when this proposition was made with the object of making it easier for the men to get in and out and to make bigger roads for the men to travel in?—I cannot understand any opposition on that ground.

16,447. I think you have taken a prominent part in all legislation that I can remember and you have opposed making man-holes, for instance, for safety?—You mean as a general proposition?

16,448. Yes, to-day there is an attempt to get the Home Office to agree to minimise the number of man-holes even in Yorkshire?—Well, I am not aware of it.

16,449. Asking them to do away with safety refuge holes in the main haulage roads?—I was not aware of it. It is a thing I should not do myself.

16,450. With regard to transport, do you admit that Yorkshire is fairly well behind the times so far as getting coal from the mine at the face is concerned, and that men are engaged in tramping in South Yorkshire from 18 years of age to 50 years, travelling in some instances 800 yards in and out?—That must be a very isolated case.

16,451. Take a few of your own cases where you have been and had a wide experience. Silverwood Colliery is a new colliery, is it not?—Yes.

16,452. You provide for tramping there, do you not?—Yes, but the tramping is limited.

16,453. That is my difficulty—that it is not limited?—I think there are no rises at Silverwood.

16,454. There are 20 yards, including in tonnage, and every additional 20 yards 2d., per 10 ton with no limit to it?—I do not think they are tramping any rises at all at Silverwood at the present time.

16,455. Take your Rotherham mine. That is 60 yards out and 60 yards in?—That is a maximum.

16,456. That is in tonnage. Then you have tramping rises in addition to that?—Yes. I beg your pardon! The old original rate in Yorkshire was 80 yards and then the tramping rises, and when the Rotherham main list was fixed, it was reduced from 80 to 60.

16,457. Can I get it from you that this method is absolutely out of date, taking a man who devotes 80 per cent. of his time to tramping tubs in and tramping tubs out instead of working at the face and getting coal?—It is practically out of date, and it is very little done now.

16,458. And the men are opposed to it, are they not?—They are, undoubtedly.

16,459. We ought not to expect men of 30 or 40 years of age to be doing this when they ought to be getting coal?—I think it is a very expensive method of getting coal in and out, working trams by manual labour.

16,460. *Chairman*: I want to follow this, because this is a very important question which has been raised by Mr. Herbert Smith. (*To the Witness*): What is the real reason of this? Is it a technical mining reason or some financial reason?—Do you mean where the tramping is done by hand?

16,461. Yes?—It is a custom which has grown up from time immemorial, and in the old days there is no doubt that the roads were such that in all human probability a horse or pony could not get into the working-place, and they were obliged to tram it out by hand.

16,462. Is it a good custom?—I should say not, because it is gradually dying out all over the country, and in the newer pits they are hauled by ponies, who go into the working-place, or it is done by small hauling engines.

16,463. Is it a financial reason which makes this bad custom continue?—It entirely depends upon the thickness of the seam. If it is a thick seam, I should say it is bad finance to allow men to tram any long distance. If, on the other hand, it was thin coal, putting on one side altogether what I may call humanitarian considerations, you would save the ripping of the roof by enabling men to tram in a low place.

16,464. What is the longest distance a man trams in your experience?—In the old days when they worked bank-and-pillar, and before we turned on to the long-wall, they used to tram the whole distance of the bank so far as ever it went up, and sometimes along to the gate as well. They would tram up to as much as (I have known) 10 rises, and that would be 180 to 200 yards of tramping each way.

16,465. What is the longest distance now that that exists?—That I could not tell you.

13 May, 1919.]

MR. CHARLES EDWARD RHODES.

[Continued.]

16,466. *Mr. Herbert Smith (to the Witness)*: Now I put it to you that why this method was adopted was simply from a financial point of view: that as a matter of fact you got men to tram tubs 80 yards out and 80 yards in for about 6d. for 10 tons? I think, as nearly as I can remember, before there were any rises or anything put on at all that the tramping rates ran to about 6d. for 10 tons.

16,467. That is what distance?—That is up to the first 80 yards.

16,468. And after that?—After that there was 2d. per 10 tons rise for every 20 yards put on. That 2d. in these days would be 4d. or rather more.

16,469. When you say there was 2d. put on, it was 2d. put on for 10 tons divided over 10 tons?—I think, if I remember aright, it was 2d. a score, so that 10 tons is right.

16,470. As a matter of fact it means taking 20 corves out and bringing 20 corves back to earn 2d.?—Yes.

16,471. I put it to you that it was done more from a financial point of view than anything else?—I should not like to say. I should think in all probability there were both reasons operating.

16,472. Now let us see if we can get this. The Barnsley Bed will be 6 ft. thick, will it not?—Yes.

16,473. Was there any need to tram with a 6 ft. seam?—When they worked bank-and-pillar to get up into the face, it was not suitable for pony work, and I do not know any of the old Barnsley Bed pits where they work 20 yard bank and 20 yard pillar where the ponies went into the gates at all.

16,474. But take your Rotherham mine. The Rotherham mine is not post-and-pillar, but it is ordinary long-wall?—Which seam is that?

16,475. Your Rotherham Barnsley Bed—I was down it not long since—and they tram there with a seam nearly 6 ft. thick?—It is not 6 ft. thick; it is not more than 4 ft. 2 in.

16,476. We measured it at about 5 ft. 6½ in. towards Low Stubbin. We went to see about the water that was supposed to be breaking in?—You mean towards Low Ground?

16,477. Yes?—I am very glad to hear it was as good a section as that.

16,478. Was there any need for tramping there with a thick seam there?—I do not think they tram very far there, if at all, though it is on the list.

16,479. As a matter of fact you have applied for every 20 yards over a certain distance 2d. per 10 tons?—Yes, but I do not think there are any rises.

16,480. Am I not right in saying that all pits in respect of the management of John Brown have tramping on the list?—All of them. They were on when I went there 50 years ago.

16,481. But you have suuk some since you went there?—Yes. They were really carried on from the original lists, and all the new prices are based on the old price lists.

16,482. What I put is that with regard to the old original list, after enquiring into it and sinking new pits, it was found more economical to tram by a human being than mechanical appliances?—Up to a certain distance.

16,483. Am I right in saying that in the Doncaster area they have abolished tramping?—Yes, except to a very, very limited extent.

16,484. And you abolished tramping for what reason?—We laid the places out so as to be as up-to-date as it was possible to be, and we have endeavoured to lay them out so as to conduce in every possible way to working them to the best advantage, not only from the point of view of the owner, but the point of view of the workman as well.

16,485. I suppose you knew Mr. George Blake Walker?—Yes.

16,486. This is what he said in a speech at the 29th Annual General Meeting of the Institution of Mining Engineers at Nottingham, when he was elected chair-

man in 1918: "The use of ponies in the mines had been reduced a great deal in recent years, and small mechanical haulage appliances had been substituted. This would be necessary in an increasing degree in very deep mines. The ponies suffered very much from the heat, and the manager of one of the deep mines near Doncaster told him they had taken out all their ponies for this reason, and small haulages and conveyors had taken their place"?—It may not have been an after-dinner speech, but it reads very like one, because I happen to know all about the York-shire Main Colliery, and, certainly, the ponies were never taken out for the reasons given there, or the hauling engines put in. It was all part and parcel of our scheme to work the place entirely without ponies, and they are working it to-day without ponies. It was only where they drove through the faults and were getting the roads made that they could not work without ponies. But now we have our permanent roads made, we are working absolutely without ponies. We are doing the same at Brodsworth, where the question of depth does not arise, because we are only 566 yards deep at Brodsworth.

16,487. Will you deny another statement which he makes: "He was informed that at the last of these collieries"—he is speaking of Doncaster—"many of the men suffer from boils and anæmia, and their working efficiency was reduced by 20 per cent. Could these conditions be mitigated on a practical scale so as to make physical exertion healthy and efficient?" Do you know whether that is true?—I do not know that there is any truth in the assertion as to boils, and at present I should not say that there is any truth in the assertion that the physical efficiency is not up to the mark, because that pit now will bear anybody's examination.

16,488. You have told us you are interested in the Yorkshire Main? We have had a large number of men complaining of the effect of these boils. Do you mean to tell us you do not know anything about it?—I do not. I have never had it reported to me.

16,489. There are not many things in the collieries which you are interested in which you miss, are there?—No; but I have missed that, or, at any rate, they have missed telling me.

16,490. It is getting so bad that we are starting an agitation that it should come under the Workmen's Compensation Act?—If it is correct, I think it is quite a fair proposal to put forward. I dare say I can give you some temperatures of the York-shire Main, if you care to have them.

16,491. The Yorkshire Main is fairly high, is it not?—Of course, it is a very great depth—1,000 yards—and until we got our arrangements completed it was undoubtedly very hot.

16,492. What would it be at the bottom?—At the pit bottom, of course, you have the full advantage of the air coming down the shaft, and you do not get the full heat at the pit bottom. It would be only about 10 or 12 degrees higher than at the surface, but when you get a short distance in it rises very rapidly up to as much as 90 degrees. But we have got it back in a great number of working places to between 70 and 80 degrees.

16,493. You have had Dr. Haldane down there a fair number of times, and he says that with regard to a man working under those conditions his physical ability is reduced more than 20 per cent.?—Well, they must be very good men to start with, because their average output per man at that deep colliery compares very favourably with any other colliery in the district.

16,494. I am confining myself now to Edlington?—I mentioned Edlington simply because it happened to be the deepest shaft in South Yorkshire.

16,495. Am I right in saying that at these deep mines in the Doncaster area no man in good physical condition does more than four days a week, because he is exhausted after he has done four days?—There is no doubt it is harder work working where you have a high temperature like that than where you are working at a shallow depth.

13 May, 1919.]

MR. CHARLES EDWARD RHODES.

[Continued.]

16,496. So that, when we talk about absenteeism, without you take these conditions into consideration, it is not fair to the men, is it?—No, I do not think it is. I have always contended that, dealing with the question of absentees, the conditions ought to be taken into account.

16,497. I quite agree. Now turn to page 5 of your proof. You say: "Then there was another slump followed in 1893 by the disastrous strike of miners." Should that not be "lock-out"? It was you people who gave us notice?—You can substitute "lock-out" if you like.

16,498. We have plenty of sins without having any more put on us. You gave us 14 days' notice: is that not a lock-out?—Yes; if the term "strike" is objectionable, then substitute "lock-out" by all means.

16,499. Now in regard to small coal, on the same page you say, speaking of Yorkshire and Derbyshire: "Up to a few years ago there was no market for the small coal produced at the collieries working the top hard, Barnsley Bed, and other coals, which was non-coking, and a good deal of small coal was undoubtedly left in the pits, most of the collieries filling the coal with either riddles or forks." Then you say that the forks and riddles have almost entirely disappeared. How long is it since riddles were taken out in Yorkshire?—We began to take them out as far back in the gas-coal pits as 1884, and I think before that.

16,500. And in Barnsley Bed, how long since?—In the Barnsley Bed I think the first that were taken out, so far as I remember, would be about 1896.

16,501. Am I right in saying they have been out now for over 18 years?—Yes, that is about it. That is about the time; 1896 would be about the time.

16,502. Then with regard to large coal left in the pit, is there not a fair amount of large coal left in the Barnsley Bed now?—Yes.

16,503. Why?—We made a number of experiments at Frickley with the object of seeing to what extent we could work out the whole or the great proportion of the seam, and we tried in three or four different banks to see what we could do in the matter. The result was that we found we were obliged to leave up the top softs, and that would represent, as nearly as I can tell you, about 12 per cent. of the whole thickness of the seam.

16,504. Am I right in saying that this coal being left in is a danger itself and caused gob fires?—Of course, it is not all left in. There is a good deal of it picked out at the back of the timber when the timber is drawn, and as much is picked as is possible to be picked out.

16,505. Supposing the inspector came down and saw me picking out coal behind the timber, what would he do?—I do not say right back in the gob, but when the timber is drawn. The coal drops and the men in the next row can reach a very considerable quantity of coal that has been dropped and fill it, and they do it. It is impossible to work out the whole thickness of the Barnsley Bed seam at some of the collieries in the district.

16,506. You mean under your present method?—Under any method you can suggest.

16,507. Let us see. You mean under present methods?—I will accept that.

16,508. Am I right in saying that at Brodsworth, which is a safety-lamp pit, we have had over 20 fires in that pit?—We have had 20 gob fires, and that was the reason we started that investigation station at Doncaster, and we have spent altogether on that station £12,000 endeavouring to get at the root cause of gob fires, and I think the result of those operations is demonstrated by the fact that we have had very few gob fires indeed during these last two years.

16,509. Am I right in saying that at Bentley, which is a safety-lamp pit, we have had gob fires?—Yes. You had gob fires at one time very badly.

16,510. And an explosion?—Yes; but I have nothing to do with Bentley.

16,511. At the Yorkshire Main, which is a safety-lamp pit, have we had gob fires?—Yes.

16,512. And at Cadeby, which is a safety-lamp pit, was there an explosion and loss of life?—Yes, but I do not think the question of safety lamps has any thing to do with gob fires.

16,513. The point I want to make is this: If it is necessary for workmen to have safety lamps to prevent explosions or ignition of gas, is it not incumbent on some one to prevent the sudden outbursts of flame from the goaf which may cause an explosion and send hundreds of men to eternity?—I quite agree.

16,514. I think you sat on a committee some time ago to deal with this question, and you did not agree with my theory then, and I suppose you would not now; but would it not be far safer to work out to the boundary and retreat back and leave the danger behind you?—For various reasons it is not so easy as it appears to be on paper. We are doing it to some extent in some places, but you do not get rid of your difficulties then, because you can have your gob fires behind you, and then there is no way of getting at them.

16,515. I take it you and I would agree that if there were only one way out of this room, we should prefer to have the fire behind us instead of in front of us?—You are assuming the fire is at a working-place, but I consider that the method we are adopting now of making the return airways in a seam below the one where we have the gob fires is the safest method of dealing with them.

16,516. Can I take it that you do not agree even with colliery men of high standing that there is a large amount of leakage of air under your present method?—With the present method which I am adopting I do not think there can be any leakage, because the return airways are in the seam below.

16,517. That is only at one pit up to now?—But we are arranging to do it in one or two places.

16,518. Of course you have been compelled to do it at that pit, or you would have had a fire every day?—There is no doubt it has done away with the fires, and to that extent we have every reason to be thankful.

16,519. If we get 90 degrees at the face, which it was at Edlington when I was down there, it is time some other method is adopted?—Yes, and we did everything that was humanly possible to adopt other means, and successfully, and I think you will agree with that.

16,520. Now I want to suggest to you again, with all your experience, we have not had the system adopted, as I suggest, of retreating; and, secondly, you cannot give any opinion as to what has been done, because it has not been tried long enough. The point I want to make is this. If you want to make this place safe by retreating, under private enterprise the argument would be all against it: You would be two or three years going out to the extent of the boundary, and would be getting no return for your money. Which is most precious—the return on capital or the saving of human life?—Of course, it is perfectly obvious that the saving of human life is preferable, and a thing which everyone ought to strive for; but at the same time it is only an expression of opinion that you would achieve safety by going to the boundary and coming back home. I am not certain that you would not have a condition of things where, if you had gob fires in an abandoned area left behind you which you could not get at, it would mean stopping the whole pit for practically all time.

16,521. You know from experience as a mining engineer that there are three conditions under which you get a gob fire: first, you have grinding in the gob and air spaces left there; secondly, you get ventilation to it and circulating through your mine, which causes the fire. In retreating, it would short-circuit itself and keep the wind at the face, would it not?—There is no doubt the primary cause of gob fires is leaving timber or bits of coal in or something which prevents absolute and complete subsidence, and it is inevitable if you get a small interstee left that it will draw the air in, and if there is a prevalence to gob fire you will have it. If all the air

13 May, 1919.]

MR. CHARLES EDWARD RUODES.

[Continued.]

was circulated it would obviate that difficulty, but not the question of gob fires altogether.

16,522. Would you agree that it would have a tendency towards safety?—I think it might, but I would not say it would be as great a success as anticipated.

16,523. So that if private enterprise cannot do it, is not that a reason why we should nationalise the mines?—But supposing you are told we are taking forward now 600 yrd panels and leaving 600 yards, and propose to bring those other panels back again, that is to some extent carrying out your views.

16,524. But it is not: it is quite the opposite?—Each of these panels is absolutely independent from the rest. Each has its own independent ventilation.

16,525. And each of those panels has a grinding process going on which would not be so under my method?—You would have the grinding process under your method coming home.

16,526. *The Chairman*: Is there any financial reason against long-wall working? Do you get a return on your capital so soon?—You would not get it so soon because it would take you so many years to drive to the boundary and then come back.

Sir Arthur Duckham: Might I ask whether it would be more expensive in the end?—*The Witness*: In the end when you once get to the boundary and are coming home, I should say it is the more economical method of the two.

16,527. *Mr. Herbert Smith*: With regard to going to your boundary, you know there is a large amount of accidents on the main roads?—Yes.

16,528. Do you think if you drove your roads out and left your coal each side there would be as many accidents through falls of roofs as there are now?—I should not like to say definitely as to that. Where the ripping is done properly in these deep mines you get your coal and everything so buried that the roads are, speaking generally, as safe as they would be if driven in the solid.

16,529. Do you not get another thing if you drive solid?—You get the seam left with the solid coal at the side and the roof locking itself in, so that it cannot fall?—I think you cannot drive in the solid unless you take the roads twenty to forty yards in width.

16,530. That is where we differ?—I could take you to collieries where it is possible to drive a narrow road.

16,531. And I could take you to collieries where it has not been impossible?—Yes. But I can take you to a colliery, the Silverwood Pit, where you will see a road driven in the solid with steel bars set every twelve inches.

16,532. But before you got to the road driven with steel bars had you worked long-wall bank before you started to do that steel, and was that the cause of it?—The road I am speaking of is one and a half miles long.

16,533. You worked long-wall banks in close proximity to it?—No, there are no banks at all.

16,534. At any rate we differ?—That road has been driven for the very purpose which you have been advocating to enable us to bring the long-wall home and I will show you the plans if you come to that colliery.

16,535. And I suggest you could not travel a worse measure than you did with the false rock on top?—But I did not put the false rock there.

16,536. But you knew it was there?—Yes; but the road had to be driven.

16,537. There are parts in Silverwood where you can do it?—Yes, where there is a rock roof.

16,538. And you can do it. All you would have to do would be to arch and keep the roof where it is, if human life is worth saving?—I think these girders are just as effective as any arch you can put in.

16,539. That is where we disagree. Now look at your accidents in Yorkshire on roads in 1910, 2,579?—On the roads?

16,540. Yes. Not at the face. There were 10,971 at the face in 1910?—Yes.

16,541. These are injuries. In 1911 there were 10,915 at the face and 2,595 on the roads?—Yes.

16,542. In 1912 you had 10,000 at face and 2,173 on roads. In 1913 you had 11,044 at face and 2,698 on roads. In 1914 you had 10,123 at face and 2,465 on roads. Now we come to fatal accidents. We find in 1910 you have 636 fatal accidents at the face and miscellaneous accidents—largely on roads—396. You carry that *pro rata* out to 1916, when you have 706 fatal accidents on roads, and you have 391 miscellaneous. I want to put it that if you had a different system you would reduce these accidents materially, and it is a question of finance entirely that pits are not driven out to the boundary of the area?—I cannot go so far as to agree with you to that extent, because a lot of the roads you are speaking of are roads which are in the solid, and I do not know to what extent those accidents are due—to falls of roof or other causes such as runaways of tubs or being caught by the tubs.

16,543. Of course, some of them are runaways, and that is one of the things the employers fought us on when we asked for a bigger clearance at the road-side. Boys are injured by getting in the narrow roads and trying to stop tubs, are they not?—Yes.

16,544. All I wanted to point out is that there is a charge imputing against some members of this Commission that they have made a statement which has not been made, and that is that colliery managers were neglectful. We are not charging that?—We have not made any such statement.

16,545. The statement has been made. I daresay a member of the Commission got a letter from some colliery manager as to a statement Mr Sidney Webb made. The point we are making is this, that we get better reforms and better conditions of work, and we say we get coal more economically for the public under nationalisation than under private enterprise. We are not charging managers with anything. We have confidence in the managers. The manager does his best, but he has to do as the directors order as to how he should develop the property and other things?—It ought not to be so if it is.

16,546. There are many men I would not put in the same category as you. There are general managers who know nothing about a pit and who sit and meet the men on a deputation and pick the manager's brains when he meets deputations. When I talk to you I talk to a practical man in every degree with regard to pits. When your managers are going to do anything at your pits with regard to the method of working, I mean the general letting out of the colliery, as to whether he should go to the boundary or otherwise, would he not have to consult your people?—He would have to consult me.

16,547. And you are one of the directors?—I consider myself a technical director, or I should not be there.

16,548. I am not saying you are not. I say he consults you?—Yes.

16,549. I go further and make this statement, that he has to consult a man that knows nothing about it as to the method of working a pit, and you know it?—I should not like to say as much as that.

16,550. Do not you know it? Do not let us have to mention names to get it out. Do not you know of managers who have suggested a change in the method of doing their work, and they have to consult men who know nothing about the pit?—That I deny. The man whom he consults always holds a certificate and is acquainted with the whole of the work. Nobody can do it unless he holds a certificate.

16,551. I know the Act of Parliament says so. As a matter of fact, in practice, I say, is it not true?—It may be.

16,552. I want to give a case. You would admit it at once if I did?—I say it may be true.

16,553. You know a manager left because he would not take on this kind of management—a good pit man in the Rotherham district?—It may be so.

16,554. *Mr. R. W. Cooper*: You were asked a question at the beginning by Mr. Herbert Smith as to certain accumulations of dead rents of Brodsworth in your South Yorkshire leases have you what we call in Durham and Northumberland a short working clause?—Yes.

13 May, 1919.]

MR. CHARLES EDWARD RHODES.

[Continued.]

16,555. Had you to make up your short workings throughout the whole term of the lease?—Yes.

16,556. When in subsequent years the workings exceed the tonnage rates, at the dead rent of the year, the excess is not charged until the past shorts have been wiped off?—That is so. We are recouped at the rate, roughly, of 7,000 tons a year.

16,557. Your power of recoupment extends throughout the whole term of the lease?—Yes.

16,558. I know nothing about Brodsworth. How many lessors have you at Brodsworth; more than one?—Three I think, altogether. There may be one or two small ones in addition.

16,559. Generally speaking in South Yorkshire does a colliery—you know what I mean by a colliery—consist of more than one taking from one lessor?—Yes, I have cases where I have as many as thirty or forty takings but they are each small freeholds.

16,560. They vary according to the circumstances?—Yes, I have a tracing which will show one particular take.

16,561. For what term of years are leases granted in South Yorkshire?—All the newer leases, the deep mines, where you take in these large areas, which you must take in to justify the expenditure of capital, on applying to the Court we have had leases up to 80 years.

16,562. Where the collieries consist of a considerable number of separate takings do the terms of the leases vary?—No, as a rule we get them all to synchronise.

16,563. If you can?—Yes, we get them extended where short to bring them up to the limit of the others.

16,564. In the older collieries of which you have had experience for lessees or lessors, I suppose in the course of your profession you have renewed leases from time to time?—Yes. John Brown & Company's leases all expired in 1912, and we renewed the whole of those. Those were 40 years originally. I arranged them, and we have renewed the whole of those.

16,565. Had you any difficulty with any lessor in procuring the renewal of the lease?—No.

16,566. You mentioned also that in 1893 you took an active part in collecting information laid before the Mining Royalties Commission?—My brother was on the Commission and I collected the information for him.

16,567. You are familiar with the findings of that Commission?—Yes.

16,568. Do you agree with the second finding of the Commission on page 79, under the heading of "Summary of Conclusions and Recommendations"? The second conclusion is: "We are of opinion that the system of royalties does not interfere with the general development of the mineral resources of the United Kingdom or the export trade in coal to foreign countries." Do you concur in that conclusion?—I do, speaking generally.

16,569. Do you think that conclusion still holds good to-day?—I do.

16,570. You refer in your *précis* to the conditions in leases in Yorkshire, and you refer to the fact that the lessee has power to determine the lease if the undertaking cannot be carried on without loss?—Yes.

16,571. Have you experience of lessees having an unconditional power of surrender in their leases at stated periods?—Yes.

16,572. Has that unconditional power grown largely in South Yorkshire?—Yes, having regard to the speculative character of the district. There is an unlimited power in several of the new leases going towards Retford.

16,573. At stated periods?—Every seven years.

16,574. I know you have a certain amount of knowledge of Durham and Northumberland. Are you familiar with the Durham and Northumberland leases at all?—No.

16,575. You have used the expression once or twice, "a shallow depth." What do you consider a shallow depth in South Yorkshire?—The seams were originally worked from the outcrop, and shafts were sunk around Barnsley as little as 30 or 40 yards, and they

greatly increased in depth, until I should rather define a shallow pit finishing at about 150 yards.

16,576. I could not quite understand from your answer why you left coal below ground in South Yorkshire?—On account of the difficulty of dealing with the roof. There have been cases where it has been left for other reasons. I will be perfectly frank. Prior to 1900 the house coal colliery and gas coal colliery could not work full time; there was not trade for it, and, as the soft part of the Barnsley coal seam has to be worked *pari passu* with the hard part, some was undoubtedly left in the pit in the summer months in order to enable the hard part to be worked, although very large stocks of soft coal accumulated on the surface in addition. Since then there has been nothing of that sort, because there has been an ample market for the soft coal.

16,577. There has been a full demand for the soft coal?—Yes, there has been a full demand for the soft coal.

16,578. In paragraph 12 of your proof you speak about valuing every royalty separately. You mean by that, of course, every area of coal where you are valuing royalty interests?—That is so.

16,579. I take it your remark does not apply to what I call a colliery undertaking?—No, it is the individual owner's mineral area.

16,580. For the purpose of determining the present value of the mineral interest?—Yes.

16,581. Of course, the necessity for separate investigation of each royalty would not apply when you are determining the value of the profit interest in the undertaking?—No; in the case of a mineral owner, some coal may not be worked for 30 years. It is perfectly obvious that the present cash value in that case—

16,582. Yes, we understand about that.

16,583. *Mr. Sidney Webb*: On this last point you strongly suggest that each separate royalty ownership should be valued independently?—Yes.

16,584. Can you refer me to anybody who suggested anything to the contrary? It is such an obvious thing?—I rather gathered from, I think it was, an article by yourself—I may be wrong—that you were taking the royalties in a lump.

16,585. You refer to an essay issued by the Fabian Society entitled "The Nationalisation of the Coal Supply"?—Yes.

16,586. Have you read that?—Yes.

16,587. I cannot find anything in that that lends colour to the suggestion that each royalty interest should not be valued separately—on the contrary. To clear up the point, will you look at page 19 in the last paragraph? There is first of all a statement as to the annual gross profits including royalties. Then there is a statement that coal mines are very risky speculations, with an hazardous and terminating life, and particular mines are often sold for only a few years' purchase of the profits. Then there is a statement that 16½ millions, including incomes of different values, which must be taken separately. Then there is a consideration that the royalties now drawn by 8,000 separate owners, though fluctuating and terminating, are better secured than the colliery owners' net profits. Then on the following page you will find a series of calculations as the estimated value of the coal, but nowhere do you find any suggestion. I think, unless you can show it to me, that this compensation would not have to be calculated separately?—I accept what you say.

16,588. It is a small point, and I do not care. It is a preposterous idea to suppose that there should be a common number of years' interest for all the incomes?—I apologise if I misunderstood you; it was done inadvertently, certainly.

16,589. On page 5 of your *précis* you contemplate there ought to be, or might be, a saving of retail distribution?—Yes.

16,590. You suggest that course should now be done by the Corporation or Council buying all the coal required for the needs of their communities?—Yes.

16,591. They have no power to do so at present?—No.

16,592. You mean they could get power?—Yes.

13 May, 1919.]

MR. CHARLES EDWARD RHODES.

[Continued.]

16,593. And they would buy in bulk in any way they thought fit for the whole consumption of their citizens?—Yes.

16,594. And distribute the coal to their citizens without any middle man whatsoever?—Yes.

16,595. You suggest that?—Yes.

16,596. You suggest there might be an agreement with regard to that?—I follow on what Mr. Straker says in his evidence.

16,597. Were you depending upon Mr. Straker's evidence for that?—No, I was saying at the present time if they can do what Mr. Straker suggests they would do, assuming nationalisation took place.

16,598. I mean you were accepting, were you not, that there is extravagance in the distribution at present?—I think there is.

16,599. That extravagance is due to, well, competition. Is it not due to the fact that you have a large number of people concerned in the industry?—Yes, you have various competitive merchants in each town.

16,600. Apparently you think those could be dispensed with with advantage?—To the community, I should say so.

16,601. We do not talk of any other advantage, we are always thinking of the community?—Yes; but they might be thinking of themselves.

16,602. Naturally. You would lose the advantage of competition if you got rid of those separate people?—You would lose the advantage of competition possibly to some extent, but the Corporations would buy their coal to the best advantage exactly in the same way that they now buy their gas coal.

16,603. In your *précis* you say that nationalisation of mines would mean the creation of a huge monopoly. Of course, the municipal distribution would mean a monopoly which would seem huge in the case of Glasgow or London. You do not object to a creation of municipal monopoly, but you object to the creation of a State monopoly?—The municipal monopoly would have to deal with the coal trade as a whole, and they would protect themselves.

16,604. For the moment we may leave the coal trade out of account and consider the public interest. When you said you objected to State nationalisation because it would mean the creation of a huge monopoly, did you only mean it would be bad for the colliery owners? You thought surely it would be bad for the nation?—Yes.

16,605. When you recommend the creation of a municipal monopoly it would not be bad for the nation?—It would be no more a monopoly than the municipalities have now who buy their own gas coal.

16,606. I quite agree?—They buy their own gas coal, and the colliery owners in bad times sell to the various municipalities and have sold at an absurdly low price.

16,607. Do forget the colliery owner. After all, important as they are, they are not quite everybody?—I thought we were dealing with colliery owners.

16,608. You said when you objected to the creation of a huge monopoly you were not speaking of the interest of the coal owners, but the public point of view?—Yes.

16,609. When you proposed a municipal monopoly I was wondering how you made the distinction from a public point of view; they seem to be the same?—I do not think that is so.

16,610. What is the distinction?—In the case of the State owning the collieries they would own the productive part of the business. The municipalities buying coal would only be purchasers the same as any other body.

16,611. You are not merely making a distinction: you like monopolies in distribution, but you do not like them in production; is that what you mean?—I do not follow you.

16,612. You notice you said that the monopolies would be a bad thing in the case of the mines. You say it is a good thing in the case of municipal distribution?—Yes.

16,613. I am anxious to get from you why you think a monopoly is a good thing for Glasgow, London or Leeds Corporations, but a bad thing for the National Government. You told me one is production, the other distribution. If you mean you like monopolies

in distribution but you do not like them in production, is there any distinction?—I do not think there is.

16,614. You object to monopolies in the realm of production?—Yes.

16,615. You do not object to monopolies in the realm of distribution?—No.

16,616. That is interesting. In the realm of distribution a monopoly would lead to cheapen the coal to the consumer?—Yes.

16,617. In the realm of production you think that would lead to an increase of cost to the consumer?—I think it might do.

16,618. You do not feel very confident?—No, a great deal of the whole subject is somewhat hypothetical.

16,619. I agree with you. I am anxious to learn from you the ground of your objection to the creation of monopolies in the management of the mines. Apparently the objection is only partly because you think it might raise the price?—Yes.

16,620. Is there any other objection?—No, I do not know that there is.

16,621. I notice with regard to barriers and ventilation you point out the larger the area to be worked to one undertaking the less the proportion of barriers?—Yes.

16,622. That is obvious?—Yes.

16,623. Therefore it would seem that the getting rid of the private ownership and separate working would be an advantage in that respect?—There should always be remembered the present conditions of things has grown up during the last 40 years.

16,624. It is none the better for that?—No, it is none the better for that. You have difficulties created which you cannot sweep away all at once. If the State was to nationalise to-morrow you could not group a number of pits worked separately now and work them as one undertaking.

16,625. You would not have them so separate as they are now?—No, not necessarily.

16,626. There is that advantage to put against the fear of extra expense. You suggest the State would not be willing to embark on new mines apparently?—I think there would be a great deal of humming and hawing, if I might say so, when you are dealing with highly speculative and hazardous ventures such as sinking a pit at Thorne near Doncaster.

16,627. You have had experience of Government departments in various capacities. Suppose the Manager of Mines was informed by the expert official it was necessary to provide an increase of coal to the extent of so many thousands of tons, and by ascertaining and sinking a number of new shafts which would have to be opened, would you not imagine that would be the regular procedure of the Minister of Mines?—Yes.

16,628. If a certain number of new shafts had to be opened each year, does it not mean the Minister of Mines has to be advised which have to be opened?—It is more a question of proving the areas.

16,629. I know that. I know if the Minister says he must sanction such and such amount of new workings it is only a question then, not of his making a speculation, but which speculation?—I think he would go in for the one with the least risk.

16,630. Of course he would go in for the one with the least risk. Do you suggest private capitalists go in for the one with the most risks?—No. When his next door neighbour has got hold of a good thing he looks about and gets the next good thing, and the man next to him gets the next good thing to that.

16,631. Do you think the mining advisers of the Minister of Mines would not do the same?—I hardly think it would follow the normal course of development under Government control as under private control. I think the initiative that has been displayed in sinking to the deep would not be undertaken by the Government in the same way as private enterprise. The Government would see their way to get all the coal they wanted for the next 20 years.

16,632. You look forward to quite a different set of mining advisers being employed by the Government than those employed by the capitalist?—From the point of view of the rising generation I hope not.

13 May, 1919.]

MR. CHARLES EDWARD RHODES.

[Continued.]

16,633. If you have the same advisers do not you think they would give the same advice?—I presume they would. I presume they would give their advice to the best of their ability.

16,634. *Sir Adam Nimmo*: Your interests have been specially in South Yorkshire, Nottingham and North Derbyshire. May I put it to you the South Yorkshire coalfield affords very remarkable evidence of the skill and enterprise of individual initiative?—Yes.

16,635. The sinkings there are deep, are they not?—Yes.

16,636. And a large amount of capital has had to be laid out?—Yes.

16,637. And great risks have been accepted?—Yes.

16,638. I think your view is that but for the fact that that development had taken place under private enterprise it would not have taken place at all, at any rate, not to the same extent?—I do not think it would.

16,639. You do not think the risks which have been accepted would have been accepted by the State if the mines and minerals had been under their control?—There would have been no necessity for the State to take on these risks, because they would have been sufficient coal in advance for a good many years without branching out as has been done.

16,640. Is your view that private enterprise has been equal to all the development necessary to meet the national requirements in coal?—I think undoubtedly.

16,641. Would you say if private enterprise is left to itself it will give you all the coal it requires?—It is only a question of labour.

16,642. And also upon an efficient basis?—Yes, more efficient in the future than in the past.

16,643. I see you express the view that the workmen have benefited very largely from this aggressive enterprise which has taken place, that is to say, employment has been found for them?—Undoubtedly there has been a very large body of employment found in South Yorkshire.

16,644. That employment would not have been found but for this enterprise in mining?—That is so.

16,645. I see you are evidently very thoroughly convinced that nationalisation of the mines would be detrimental to the nation, and you give a number of reasons: that individual effort and initiative would be withdrawn; there would be no change in the price of coal; no initiative to practice economy, and the State would not obtain the best brains for the development of the industry. You were asked a question by Mr. Herbert Smith as to the State securing the best brains for the management of the industry. I put it to you that under the State there will be a disposition to standardise salaries?—I do not know what the procedure under the State would be. I hardly think they would begin to discriminate between one man and another to any appreciable extent so it would result in some form of standardisation.

16,646. Is not that why they proceed by classification?—I am not aware of the methods by which the Government deal with their salaries.

16,647. If they deal with salaries in that way, would it not have an important effect in withdrawing initiative and enterprise?—Unless a man could see he was going to get full reward for his efforts, I think he would be inclined to slack off.

16,648. Do you know whether as a matter of fact in connection with the present Government control there has always been considerable difficulty in dealing with the salaries, that is to say, since the salary question was controlled?—I think there has been; I do not know of any specific instances.

16,649. And enormous difficulties are always put in the way of dealing with the question of salaries?—Yes, so far as colliery staffs are concerned.

16,650. That is what I mean?—That is so. We have been held up as far as our clerical staff is concerned. We have not been able to advance their salaries.

16,651. And also with regard to the administrative staff?—That is so.

16,652. Certain limits being fixed where these limits were regarded by the particular owner as reasonable or not?—Anything over £250 a year I think it was.

16,653. Would not the position be a great deal worse if the whole of the mines were nationalised and run under one national system?—I cannot say.

16,654. Would you say, however, that every mining engineer always has the hope that he will become interested in the company or companies he is serving?—Everybody has naturally a hope that by experience he will be able to demonstrate his usefulness, and rise in the scale of his profession.

16,655. Does not that bring the best out of the men?—I think it does. I think the reward has always the effect of that.

16,656. There will always be a strong incentive behind the man in these circumstances?—There is always a great deal of humanity about us all.

16,657. You have not any faith in carrying out a scheme for the redemption of the world based upon the fact that there is to be no longer work for private gain?—I think I shall not be able to see it fructify.

16,658. Do you think the State would hold together under any such principle?—I do not think it is possible to eliminate the natural competition between human beings.

16,659. Have there not been a lot of theories put forward in the past based upon that principle that have come to nothing?—I have read of a great many theories but I cannot recall them all to mind.

16,660. Do you not think the motive of private gain will continue to supply the cause that will lead to development and enterprise in this and other countries?—I am afraid it is so.

16,661. You were asked questions by Mr. Herbert Smith as to whether control had not been set up during the war to prevent coal being held up? May I put it to you the real reason for the control having been set up was first of all to secure a distribution of the coal to meet the national necessities?—That is so.

16,662. And to prevent the price of coal rising unduly against the consumer?—Yes.

16,663. This was a serious matter at the time.—Yes.

16,664. Mr. Herbert Smith asked you a good many questions as to whether you were in an efficient position in the areas you represented in regard to the placing of shafts and also in regard to the working of coal. Is it your view that you could not afford to put down an unlimited number of shafts?—Undoubtedly. If you increase the shafts to such an extent you would make the capital so enormous that even the State could not carry on.

16,665. Should you not always lay down your shafts in relation to the working of an adequate area of coal?—You are bound to do that.

16,666. And in the working out of that coal especially where the sinkings which you would require were deep the workings would have to be carried forward for a considerable distance from the pit bottom?—Yes, the prudent manager would see that these roads were laid out.

16,667. Has there not been a levelling up of mining opinion with regard to this matter within recent years?—Undoubtedly.

16,668. Has there not been a constant and steady evolution of the practice?—I think the practice has been improving largely.

16,669. Leading to better results?—The better collieries have set the example to the poorer ones.

16,670. Your view is that that progress will be steadily maintained?—I think you will see a great improvement in the next decade.

16,671. And as rapidly as they would be maintained under any system of State management or control?—Yes, I think so.

16,672. I think you said the State could not be indifferent to the outlay of capital?—It could not.

16,673. It cannot do things regardless of expense?—No.

16,674. It would require to carry on the undertaking on a reasonable economic basis?—Yes.

13 May, 1919.]

MR. CHARLES EDWARD RHODES.

[Continued.]

16,675. No doubt, having regard to the question of safety?—That is so. With regard to the question of economical working, we are linking up now, and a cable is being erected for a circle of something like 30 miles to connect a group of collieries so as to deal with the mixed waste heat and by pressure turbines to collect the whole power required for the various collieries, and by that means to dispense with a large number of boilers.

16,676. If the State is to deal with the various mining problems regardless of expense, would it not mean the price would be put up against every consumer in the country?—If they did it regardless of expense it must follow.

16,677. Would not that be a serious matter?—Yes, that would.

16,678. Would not the first business of the State be to consider the effect on the price of coal in relation to the consumer?—It must either come from the taxpayer or the consumer.

16,679. The State, in dealing with the working of the mines would require to keep that very much before it?—I think it would.

16,680. You were asked by Mr. Herbert with regard to the question of leaving round coal underground. I take it for the most part there has always been a good practical reason for that?—That is so.

16,681. I think one of the chief reasons you gave was that it had to be left in in many cases to protect the roof?—Yes.

16,682. That is for safety?—Yes.

16,683. The State would require to do that the same as any individual owner requires to do it?—That is my opinion.

16,684. Does it not come to this, you have to judge of each particular case by the circumstances surrounding it?—You must do. Every coal seam must be judged entirely on its own basis.

16,685. You cannot say in general terms that coal is being wasted or lost because it is being left in?—No.

16,686. You have to consider the actual facts in each individual case surrounding the leaving in of that coal?—Undoubtedly.

16,687. I think you indicated as another reason, and probably you will be criticised for this, that you left in the coal in some cases because there was no market available?—That was so.

16,688. You mean no market available for that particular quality of coal?—During the one or two or three months.

16,689. Can you see any way by which the State could have forced that coal on the market?—Not in those days, because the price of coal was extraordinarily low; an average selling price of about 4s. a ton.

16,690. So that as far as nationalisation is concerned you gain nothing by falling back on such an example as that in the past?—That is so.

16,691. Is it not the case that as markets are discovered for the coal, the coal is put up?—That is so.

16,692. Whether it is round coal or small coal?—That is so. It is stacked to as great an extent as possible.

16,693. And as engineering uses are found for round coal and small coal that was previously left in, that is brought to bank?—Yes.

16,694. And is being utilised?—Yes. A large percentage of soft coal which the consumers would not use before is now used for steam raising purposes and in other ways.

16,695. The road of progress will go on as knowledge increases in regard to the use of that particular coal?—I think so. The result of the last 12 or 14 years proves that.

16,696. You were asked about the question of working first of all to the boundary and coming home, what was called the retreating system. Do you know whether the system has been already in operation in a number of collieries?—Yes, not to any extent in South Yorkshire; but it has been done and is done now in Staffordshire in some parts of the district.

16,697. Is a portion of engineering directed to that?—Yes.

16,698. Was the practice unknown until a comparatively short time ago?—Except I think in Durham. I think they opened out large areas there in the old pillar and stall, and they bring home pillars that had been left for 30 or 40 years.

16,699. Is it a system that can be carried out only as knowledge increases?—Yes, I think it is a matter that wants approaching with considerable precaution.

16,700. Is it an expense to the owner in the long run?—Not in the long run. If you have to wait five or six years before you get anything back it means finding more capital, and you have to increase the capital of the colliery, although you may recoup that in later years.

16,701. In leaving it narrow to the boundary the roads are more easily maintained to begin with?—They are.

16,702. When you return home from the boundary the coal will be got cheaper?—I think it will.

16,703. Therefore, although the owner may have to wait for a return on the outlay of his money in the long run he will make more money if the circumstances are such as to permit him to go to the boundary first?—I think he may. When he gets to the middle he might not see the result of his driving to the boundary.

16,704. In your view, it is a matter for determination in each case whether that line of policy is wise or unwise?—I think the two systems could be combined to working out, and, at the same time, pushing forward to the boundary. You would get to the boundary then and come back home, and then abandon your outgoing work altogether.

16,705. It is not really a question of finance as put by Mr. Herbert Smith?—It is a question of finance in the first instance if you go straight to the boundary. You must find the money to drive the road to the boundary, and find the capital interest on, say, the £500,000 or £600,000. That interest would have to be found by the persons owning the undertaking, and they would have to wait their return until they were in a position to come home.

16,706. With regard to the large companies you are connected with in your district, they would be quite ready to drive to the boundary in the first instance if they were convinced it would be to their practical advantage to do so?—They would.

16,707. They would not hesitate to do it?—If I advised them I do not think they would hesitate for a moment.

16,708. You must deal with each case on its merit as to whether the method can be adopted or not?—Yes.

16,709. You are asked with regard to the question of accidents. Is it to be suggested that any system of mining will entirely dispense with accidents?—I am afraid whatever is done mining will always be a dangerous occupation. I think a great deal can be done to minimise accidents; but comparing accidents in this country with those in other countries, with, I think, the one exception of Belgium, they compare very favourably.

16,710. Is it your view it is a matter of opinion as to whether these accidents will be reduced in number by nationalisation as compared with the continuance of the present system?—It must be a matter of opinion. It would be confessing the present system was wrong and that men were sacrificed for the mere purpose of keeping down costs. With that proposition I absolutely disagree. I say the ordinary colliery manager is a capable efficient and hard working man. As a rule he has sprung from the colliers themselves, a great bulk of my own managers have, and the under managers it applies to still further. I believe they have as much interest in maintaining their workings in safe order as any system that could be brought about by nationalisation would have.

16,711. You do not think in this country the managers of the collieries are influenced by financial considerations?—I do not think so.

16,712. Is it your experience that any director of a company would interfere with the manager in a matter of safety?—I do not know of one.

16,713. Is it not the case that in all these matters and also in the bigger question of development the

13 May, 1919.]

MR. CHARLES EDWARD RHODES.

[Continued.]

manager generally consults with the general manager?—Yes, he does.

16,714. Is the technical director a man of large experience?—Yes, there is generally a technical director or consulting engineer who is responsible for the general lay out. That is taking all the fair sized collieries in the district.

16,715. So that he gets the benefit of all the skill and knowledge that can be brought to bear upon the practical proposition he has to deal with?—He has to get the benefit of what has been done at a large number of other collieries and apply it as far as possible to his own conditions.

16,716. And everything is done for the maximum of safety and efficiency?—That is my opinion.

16,717. That is your experience?—Yes.

16,718. You were asked with regard to the question of distribution by Mr. Sidney Webb. The question of distribution is not a coal owner's question?—No.

16,719. The coal owner as such very seldom undertakes the problem of distribution at all?—No, he does not.

16,720. He manages the industry on the productive side?—That is so.

16,721. And he hands over the coal to quite a different body altogether?—Yes, that is so.

16,722. Who are interested in its distribution?—Yes.

16,723. It was suggested to you that a scheme of distribution undertaken by municipalities would be the same in character as a national distribution under State ownership. Do you think there is any connection?—I do not.

16,724. Would you not have a very large number of municipalities dealing with their own problems?—In exactly the same way as the gas works do to-day.

16,725. Would they not be buying and distributing their own coal?—Yes.

16,726. Would there not be for all effective purposes quite free competition in coal in the market?—The same as in railways.

16,727. There would be in no sense a monopoly such as there would be if the mines and minerals were nationalised?—If times were bad they could get their coal cheap.

16,728. You say no comparison can be drawn between a State monopoly and a municipal monopoly?—I do not think so.

16,729. Now one or two questions on the efficiency of the mines. I see you refer specially to the evidence given by Mr. Straker and Sir Richard Redmayne. May I ask you if you regard this problem which they specially refer to as being exceptional in the working of the industry or the rule?—I think they are not exceptional at all.

16,730. Do you suggest they are not limited in their extent?—Which particular one?

16,731. I take it the problems you refer to as mentioned by Mr. Straker and Sir Richard Redmayne are the cases where coal was being held up in various ways, or lost or wasted. It is in paragraph 13 of your *précis* on page 4. You say that you have considered the evidence already given by Mr. Straker and Sir Richard Redmayne, and there are many things which you think have been somewhat exaggerated. The particular points that are being dealt with, I understand, relate to instances of loss of coal in various ways?—Yes. The first part deals with profiteering, and then that loss of small coal left underground.

16,732. As you know, Sir Richard Redmayne expressed the view in that connection that the system of private ownership was wasteful and extravagant?—Yes.

16,733. Do you hold that view?—No.

16,734. Do you consider it a quite unjustifiable view?—I consider it is a quite unjustifiable view having regard to what private ownership has done and is doing in connection with the development of the by-product industry.

16,735. Would you say that the reasons given by Sir Richard Redmayne were inadequate to justify that proposition?—I think to say wasteful and extravagant is not a fair way of putting it.

16,736. Are you aware that that statement by Sir Richard Redmayne has caused a considerable amount of indignation in the industry?—Yes.

16,737. You are aware of that?—Yes.

16,738. You are not surprised, are you?—No.

16,739. You were a member of the Mining Sub-Committee of the Land Acquisition Committee which dealt with this class of property?—Yes.

16,740. And you know the proposals that have been made for disposing of these difficulties?—Yes.

16,741. Do you regard the proposals as entirely adequate for the purpose?—I think so.

16,742. Do you look upon the machinery that was set up there as being simple and practical?—Yes, I think so.

16,743. And as likely to be inexpensive?—Yes.

Chairman: I think Mr. Rhodes has signed the Report; therefore he would naturally say he regards them as adequate.

16,744. *Mr. R. H. Tawney:* You were asked certain questions about the salaries of colliery managers to which I think you assented. Can you tell us the facts about them? For example have you any figures or any tabulation of the salaries of colliery managers?—I have no figures tabulated. I know they vary very much.

16,745. Within what limits do they vary and how are they grouped?—The man who holds a first class certificate, and then there is the man who holds a second class certificate. With regard to the man who holds the first class certificate it depends on the size of the colliery, the experience he has had and his qualification in other ways what he is paid, and his salary will run for that class of man in Yorkshire from £500 or £600 a year up to £1,000 or £1,200.

16,746. I want to know something quite simple. Whatever may be the disadvantages of Government employment one of the advantages is the public knows the facts. Are figures about the payment of the colliery managers accessible or not?—You can get them by applying to the colliery what they pay their colliery manager. I have not the figures here.

16,747. I have not the facts. You gave rather a roady assent to the question put to you and I assumed you had. Certain comparisons were made between managers under private and public employment. It was suggested I think that in private employment a man, to quote your words, could demonstrate his usefulness and rise in the scale of his profession, and in public employment he would not. Was not that the question?—I do not think in public employment he would have quite as good a chance as in private employment.

16,748. Could you elaborate that? You say with regard to what is the practice in public employment possibly does not demonstrate their usefulness and rise in the scale?—I have no great experience of public employment at all.

16,749. That is a perfectly good answer. I put it if that is the case the comparison which you draw is the comparison to which you assented, I think it was not more than that, was made a little hastily, was it not?—I do not quite follow you.

16,750. A comparison was put to you between the advantage of private and public employment. You said in private employment a man would get on and in public employment he would not, to put it shortly. That does not correspond with your experience, and I should like to know what you were thinking of. Does not a man get on in public employment?—In private employment if a man shows himself to be really a good man at his colliery and another man is on the look out for a capable man, he says: So-and-so has done well at that particular colliery. I will get hold of him and offer him some inducement to come to us. There is a good deal of selfishness about it, but it is done.

16,751. Would not that apply to a Government department too?—I do not know.

16,752. I suggest when the man has made a success at one Government department another Government department says: That is a good man; I should like to tempt him to come to me?—That may be so.

16,753. It seems somewhat analogous to private employment in that respect?—Yes.

13 May, 1919.]

MR. CHARLES EDWARD RHODES.

[Continued.]

16,754. The next point is as to the mineral owner. You have given us certain cases in which mineral owners have taken the initiative in the development of coal at the bottom of page 2 and the top of page 3. Can you tell us how far that is the general rule?—I should not say it is the general rule. It has been done, and is being done, but to say it is a general rule I could not say.

16,755. Would it be fair to say that though this valuable action is taken and is taking place, on the whole it is somewhat exceptional?—I agree.

16,756. In the majority of cases, that is to say, the cases in which it does not take place, what exactly is the position of the mineral owner *vis-a-vis* the industry—what is his function in it?—He practically has no function except leasing his coal and giving the necessary facilities for working it.

16,757. You say he has no function. Probably you are a working man as much as anybody else?—Yes.

16,758. If he has no interest what should he be paid? Excuse me asking you a leading question. It is a point that is always coming up, and I cannot understand the point of view. What is he paid for?—He is paid because under the law of England he owns the coal. That is the reason I gather he is paid.

16,759. Do you think it is a good thing that people should be paid if they perform no function?—I should not like to answer that question.

16,760. It is not nearly as large as some of the questions you have answered. For example, you were asked if you had heard of or considered a scheme for the redemption of the world where men will no longer work for private gain?—I do not admit I knew anything about that.

16,761. That is quite sufficient. I understood your answer to the question, what does the royalty owner do, was in the normal case he does not do anything?—No.

16,762. Mr. A. Balfour: I take it from paragraph 11 on page 3 of your proof, you think it is of great importance that the consumer should be protected with regard to the price of coal?—Yes.

16,763. In the present conditions competition protects the community?—Yes.

16,764. Under State control it does not?—At the present time by private enterprise in a falling market there is the competition, which has the tendency to bring the price of coal down, and the consumer benefits to that extent.

16,765. Would there not be another thing, the Chancellor of the Exchequer might put a tax on coal to increase the Revenue?—They have put a tax on export coal, and it lost us a very considerable market.

16,766. Is there any difficulty in the consolidation of collieries and coalfields in counties, so as to get more economical working?—Speaking generally, no, but there are cases, undoubtedly, where by a combination of small collieries you could get more economical working.

16,767. You think there is something to be done in that direction?—I do.

16,768. Can you suggest how the workers' ambitions, to be more closely connected with the coal production, can be carried out without interfering with efficient and economic production?—I cannot grasp what your question is.

16,769. You do know the workers desire to be more closely connected with the industry?—Yes.

16,770. Can you suggest any way in which that can be done?—I have never been able to see any objection to the workers being consulted and taken into consideration in dealing with the general carrying on of the colliery, so long as they do not interfere with the management.

16,771. Give us, more particularly, your view and how you would go about it yourself?—I could not give any particulars. I used to see the men myself when at the colliery regularly and talk to them about everything going on.

16,772. Do you approve of pit committees?—I do, personally; I have not the slightest objection to them.

16,773. Is there any reason why the Miners' Federation should not own collieries of their own and work

them, and test some of the theories which Mr. Herbert Smith put forward?—There is no more reason why they should not do it than the Co-operative Society. The Co-operative Society are going in pretty largely for coal exploitation.

16,774. They get some valuable experience?—I do not know what their experience is up to now. I think they took a large coalfield in South Yorkshire and they are going to sink.

16,775. Would not the Miners' Federation get very useful experience?—I suppose their Federation was formed for a totally different purpose.

16,776. Would it not be useful to test these theories?—If they like to embark as coal owners, it would be useful. They would reap the plums and also have the sour grapes at times.

16,777. Sir L. Chiozza Money: I think you said, as a mining engineer, if you had to decide the system for a new mine, you would drive to the boundary for the coal and work on the retreating system?—I did not say that.

16,778. Then what did you say?—I said the whole question was one for consideration. There would be advantage in driving out to the boundary and then retreating home, but that while carrying out that process you would be holding up for a number of years the development of the colliery so far as the production of coal is concerned, although you would reap the benefit later on when you began to come home, and you would increase the capital whilst you were doing the driving out to the boundary.

16,779. Generally, and, save in exceptional cases, you would drive out to the boundary?—It entirely depends on financial considerations.

16,780. It depends upon financial considerations. You talk about human nature in that connection, as many others have done. Is it not human nature to demand a quick return for your money?—I think it is very common to us all.

16,781. In that case, human nature that has been talked so much about at this Commission is directly opposed to driving out to the boundary?—I should not like to say that. I am driving out to the boundary now, but I am doing it, while at the same time I am keeping up the output by going away from the shaft.

16,782. Is it not the fact that the desire to get a quick return on capital is directly opposed in the general case to the system of driving out to the boundary and working the coal on the retreating system?—I think probably that would be necessary for the first 10 years of the life of the colliery.

16,783. That is exactly what I mean?—It has not been proved yet that driving out to the boundary in all cases is going to be either a financial success or one that is going to reduce accidents.

16,784. You agree generally it is quite an engineering proposition?—It is, I agree.

16,785. Is it not the fact that human nature, which has been introduced so often on this Commission as working the national interest, would in that case work against the national interest, because you would want a quick return on the money?—That would be necessary if you want a quick return.

16,786. Is it not the fact that human nature has prevented the proper working of the national resources, because you do not get a quick return for your money?—I think that is so.

16,787. With regard to the managers' salaries, do you mind telling me what the range of the managers' salaries are in Yorkshire. What is the smallest salary you have heard of?—The smallest salary I pay myself is £550 a year.

16,788. What is the smallest salary you have heard of?—In some of the small collieries, I could not say, but take the ordinary collieries I should think about £500 a year.

16,789. Do you think that is sufficient at the present cost of living?—They are getting bonuses upon that.

16,790. With the bonuses, come, Mr. Rhodes. Do you think on your human nature theory that is sufficient to get the best out of a manager of the mine?—I daresay they get, with the bonus, their

13 May, 1919.]

MR. CHARLES EDWARD RHODES.

[Continued.]

house and coal—that is about the lowest scale I know of. Some of the higher ones go to as much as £1,500.

16,791. Are you aware there are complaints made by the Mines Managers' Association with regard to managers?—Not in Yorkshire.

16,792. I am not speaking of Yorkshire?—I have seen it in the papers.

16,793. Do you suggest the State would reduce the salary?—I do not suggest that.

16,794. Have you heard of any cases of nationalisation or municipalisation, which is practically the same thing, of other industries where the salaries have been reduced?—No.

16,795. Has it not been the experience, taking the telephone system and the London trams, that wages and salaries were not decreased when they were taken over?—I do not know. I take it from you that is so.

16,796. Have you heard the Government is introducing an Electricity Bill?—Yes.

16,797. Do you think that a very foolish thing?—No.

16,798. Why not a foolish thing if that incident of private gain is needed and by such an extraordinary basic undertaking when under the Government. Why is it a foolish thing to make electricity a State monopoly?—I do not know they are making it a State monopoly. We are doing a great deal of electrical work for the collieries round Chesterfield.

16,799. Have you heard they have electricity in Cologne?—I do not know. I have some sons there.

16,800. Do you know our soldiers ask why the working people have electricity and they have not at home?—No.

16,801. To come back to the Government Electricity Bill, if the incident of private gain is necessary to make that industry give the best result, is it not a deplorable thing that the Government has nationalised electricity?—I should not say so.

16,802. Why?—There are districts where private enterprise has not developed at all. There are districts where private enterprise is dealing with electricity, and the Yorkshire Power Corporation is one. There is a large enterprise in the north of England, Newcastle.

16,803. Electricity, you know, is coal in this country?—Yes.

16,804. Why human nature applied to coal in the form of electricity should fail in the case of coal nationalisation and should not fail in the case of electricity is not clear. What was the difference in your mind?—There is no objection at all to the Government to do that if they like. So far as coal is concerned they can take 100,000 acres and sink shafts and work the coal pits themselves just in the same way as they can start and deal with certain areas of electric undertakings themselves.

16,805. That is not my point. You do not oppose the Government nationalisation of electricity?—No, so long as they give facilities for private enterprise as well.

16,806. They are not going to do that.

Sir Arthur Duckham: Have you evidence of that? I should like evidence whether the Government is going to nationalise the electrical undertakings. This discussion is on the question whether the Government decides to nationalise electricity in this country. I know of no decision of the Government with regard to this.

Sir Leo Chiozza Money: We did not know of many of the things Sir Adam Nimmo put, but Sir Arthur Duckham did not intervene then.

Chairman: We had better keep to the question of coal.

Sir Arthur Duckham: This question of electricity has importance.

Sir Leo Chiozza Money: I submit I ought to have the same protection as Sir Adam Nimmo. Sir Adam Nimmo was putting leading questions, and I asked if we might have the answers. I am not putting leading questions.

Sir Arthur Duckham: Sir Leo is asking if the Government is dealing with electricity.

Chairman: We need not trouble about electricity in this Commission. Perhaps there will be another

Commission with regard to that. Sir Leo, you do not want to introduce electricity. This witness has now taken over three hours, and I have still over 60 witnesses to call. We shall never finish.

Sir Leo Chiozza Money: I have not taken three hours.

Chairman: You have been most considerate.

16,807. *Sir Leo Chiozza Money:* If the Government decided to nationalise, would it not be important to buy coal on the best possible terms?—Yes. It ought to obtain the available sources of power at a large number of collieries and other works which are available and which would go to waste if not utilised.

16,808. Do you think it would be a good thing to have big district coal trusts or a number of trusts, and the country buying coal or electricity from the trust or trusts?—It would buy its coal from the trade as well.

16,809. Would not the trust have the power and opportunity, unless special provisions were taken, of holding up the supply of coal?—I hardly think that could be so.

16,810. You know that has occurred in other countries?—Yes. I do not know myself it could occur here unless there was an enormous demand for coal.

16,811. The German Government had to protect itself against coal trusts, for example?—I believe that is so.

16,812. Is not that up against the formation of coal trusts in this country?—That is up against the formation of coal trusts in this country.

16,813. With regard to the matter of the thin seams, I understand you to say as much as 12 per cent. is left?—Yes.

16,814. You do not contend in your answer that was necessary?—I do, because we work a number of hanks in different ways, and if I had known I was going to be asked as to this I should have produced the plans and the method of working we adopted. We tried three ways of working: the working of the coal seam out and leaving in the top portion and leaving the next portion.

16,815. Was it engineering difficulties or financial?—Engineering entirely.

16,816. Financial difficulties having nothing to do with it?—No.

16,817. You have not advised any engineering people to save that 12 per cent. for you?—No, it was entirely a question of the roof.

16,818. With regard to costing, you said it was a great advantage to compare costing and operations at different collieries?—Yes.

16,819. Do not you think under nationalisation the opportunities you have had to compare different companies' methods would obtain throughout the entire country?—I think it probably would.

16,820. Would not that be a greater advantage under nationalisation to compare methods and costs?—It would be an advantage.

16,821. With regard to the efficiency of the mines in Yorkshire; you know Mr. Mottram?—Yes.

16,822. Do you think he is a man of good judgment?—Yes.

16,823. Are you aware he told us he puts the proportion of mines where up-to-date plant is employed at about one-third?—I should think he is about right.

16,824. Is not that rather a serious reflection on the efficiency of mining in Yorkshire?—I should like to say this. The two-thirds were sunk 40 or 50 years ago. They put down what was fairly up-to-date plant at the time, and at that time the wildest dream in the way of output was 1,000 tons a day. That has risen to 4,000 and even more than that. We are winding 7 tons where they used to wind 1 ton. Comparing the two things, no doubt he was proving that.

16,825. Do you agree with Mr. Mottram that in many cases it could be brought up-to-date?—I do not agree with that.

16,826. With regard to the riding in of the men, tell me what in the case of your own collieries stands in the way of riding the men underground?—We ride a great number of our own colliers.

16,827. What is the cause of the majority where it is not practised? What stands in the way? Is it conservatism, financial difficulties or what?—I do

13 May, 1919.]

MR. CHARLES EDWARD RHODES.

[Continued.]

not know exactly what the difficulty is. In many cases they have not suitable roads in which they could run a rope to go faster than about one mile or two miles an hour, which is an endless rope rope, which is useless for riding men in and not a suitable road. No doubt those roads could be made to do it, but it would take a long time to make them.

16,828. That is not a matter of engineering difficulty?—No.

16,829. It is a matter of bringing the method up-to-date and providing the money?—Yes, and I think it would pay to do it.

Sir Arthur Duckham: Before I ask any questions, there has been the question brought up again of Mr. Walsh. Can we find out why Mr. Walsh was not on the Committee?

Chairman: I will try and find out.

16,830. *Sir Arthur Duckham:* With regard to this question of the difficulty of the private ownership of minerals, could you tell us in what percentage of cases difficulties arise from private ownership? Do you have a case a year?—No.

16,831. You do not have a case a year brought to your knowledge of difficulties arising from private ownership?—No.

16,832. It does not mean you as a colliery proprietor or owner are in any great difficulties?—No.

16,833. There has been a discussion here with regard to the difficulty some mines have of paying their way. Can you suggest any method of assisting those mines, short of nationalisation or unification, in which those poorer mines could be assisted?—They could only be assisted by a group system under which the better mines assisted their poorer brethren.

16,834. They could assist them with advice?—Advice would not go very far.

16,835. Would the assistance have to be financial?—When you are *in extremis* mere advice does not help very much.

16,836. Could they do it by joining up the workings?—I do not think so.

16,837. It would have to be finance?—It would have to be finance.

16,838. With regard to the small coal which is left in the mine, has there been a co-operation amongst coal miners to provide new methods of dealing with it?—In connection with the small coal left in the mine, the introduction of washeries revolutionised the trade altogether in South Yorkshire. Prior to the introduction of washeries, small coal could not be dealt with, except to a very limited extent. With the introduction of washeries, something like, in many cases, 50 per cent. of the output was washed and the small coal was re-mixed with large, after being washed and collected. That got rid of the difficulty of small coal to a certain extent. That, coupled with the development of the coking industry, and it is a question of what is the market for the coke in the future.

16,839. There is still a quantity of small coal left on the pit bank?—There is none to a great extent.

16,840. Is it the war that has cleared that off?—It was the introduction of the washeries. In Yorkshire there were large dumps, but these have nearly all disappeared.

16,841. You do not know anything about Nottingham?—I do.

16,842. They have a lot of small coal there?—Yes.

16,843. Is there any co-operative work being done amongst the coalowners for handling the small coal?—No.

16,844. With regard to walking; it is an advantage to have the men walk as little as possible?—It is. When the time is limited, the question is to get the men to and fro as quickly as possible. It must be an advantage to the men to get there fresh instead of tired.

16,845. Is it harder walking or working?—I should say working than walking.

Mr. Robert Smillie: May I clear up the position of Mr. Walsh? Mr. Walsh was not a member of this Committee.

Sir Arthur Duckham: Was he asked to be?

Mr. Smillie: He is not on the list. You said there was no Labour member on the Committee.

Sir Arthur Duckham: I asked the question, and the Chairman said he would try and find out.

Chairman: You want to know if he was asked?

Sir Arthur Duckham: And his grounds for refusing.

Mr. Robert Smillie: All those co-opted were mining men.

Chairman: Yes. The additional members were Mr. Forster Brown, whom we have had here, Sir Adam Nimmo, Mr. Rhodes, and Sir Thomas Radcliffe Ellis.

16,846. *Mr. Robert Smillie:* We have heard it suggested this report of the Committee on which you served was drawn by the Chairman, and it is a report you signed. Is that true? It is the Committee's report. Did they meet to deliberate on their report?—Yes.

16,847. You met from time to time and discussed this report of the Committee?—Yes.

16,848. There is no truth in saying it is not the report of the Committee?—The Committee sat and discussed the report from beginning to end.

16,849. It has been said this Committee was set up to deal with such questions as this Commission is dealing with now. Is it not the fact at the same time, shortly prior to this Committee being set up on which you served, there was a Coal Conservation Committee sitting dealing with the question of barriers, flooding of mines, and all questions of waste of coal and the working of coal?—Yes.

16,850. Are you aware of that?—Yes.

16,851. Did you see the report of that Committee?—Yes.

16,852. Was there not a number of mining men upon it?—Yes.

16,853. Practical mining engineers?—Yes.

16,854. They did deal with the barrier loss and of small coal and all those questions?—Yes.

16,855. Was there any necessity for this Committee being set up subsequent to it, and set up by men who knew nothing about the question and dealing with such question?—I do not know what the reason was for setting up the Commission at all. It was set up, and I was asked to come and sit upon it.

16,856. Was it not the Acquisition of Land Committee?—Yes.

16,857. What had it to do with the loss of small coal and barriers?—I do not know why it was set up or anything. I know I was asked to sit upon it and did so.

16,858. Is Sir Adam Nimmo correct in saying that the retreating method of working coal has only recently been thought of? Is it not as old as 40, 50 years or 60 years?—I did not gather that Sir Adam Nimmo said that.

16,859. He said it was only of recent date?—I know in Durham I have been working there. That must have been driven 30 years ago, and the pillars are coming back now.

16,860. 30, 40, or 50 years ago there was worked pillar and stall. Did you get to the barrier first and bring back?—I think that is right.

16,861. Did you work to the barrier and bring it back for the purpose of leaving the waste behind you?—Yes.

16,862. It is not of recent date?—No. It is quite on all fours, if I may venture to say so, with long wall.

16,863. I know that. What you require to do in opening up a seam is to sink as near to the centre as possible, things being equal, to get to the dip of the field and drive narrow places and have your extreme benefit?—Yes.

16,864. And then drive away long wall and bring it back?—Yes.

16,865. That would prevent the weight which is such trouble to mining managers over your main roads?—Yes, undoubtedly.

16,866. I believe you feel sure that it is a financial difficulty which prevents that being done. If that is done probably in addition to the sinking of the shaft it may take 2, 3 or 4 years to drive narrow to the boundary, according to the distance, you have to go?—Yes.

13 May, 1919.]

MR. CHARLES EDWARD RHODES.

[Continued.]

16,867. It would depend whether it was 5 yards or 6 yards as to its taking 2 or 3 years?—Or more.

16,868. You would be paying your dead rent to the useless royalty owner all that time?—That would be so unless you provided for a minimum rent.

16,869. Under your present leases if you broke away, in which case this would be the best way to work the coal, you would be paying £10,000, £20,000 or £30,000 during the time you were endeavouring to get to the extreme end?—In some leases the minimum rent rises up to the 10th year; that would give time for development.

16,870. I daresay there is hardly anything in connection with the industry of mining or inspection you have not read or have knowledge of. Do you remember any reform at all that has been proposed since the year 1842 down to the present time that has not been opposed by the mine owner and land owner in this country. I was reading during the week-end history with regard to the whole question of mines and miners. Do you remember anything not opposed? The same system that Sir Adam Nimmo put to you was not made without opposition. From the year 1842 right down to 1862 it was proposed again and again by skilled men in the mining industry that there ought to be two shafts, or three or four or five. Then an explosion took place in which a large number of men were killed, and after every explosion from 1850 to 1862 it was said there ought to be two shafts, and did not the employers oppose that?—They may have done.

16,871. Did they not oppose the second shaft?—I could not say from memory. They may have done.

16,872. Do you remember in 1862 the Hartley disaster took place?—Yes.

16,873. Do not you know that had to take place in which 204 men lost their lives before we had the second shaft down?—That is so, I believe.

16,874. Up to that time did they not oppose it on the ground of expense?—That may be so.

16,875. The mine owners said there would be too much expense to put a second shaft; one shaft was sufficient on the ground of expense. I put it to you, on the ground of expense you did not develop the coal fields in this country on the retreating system, and every mining engineer believes that would be the safest as far as life and limb is concerned. Is it not always a question of expense?—I do not think it is altogether a question of expense. There are physical difficulties which are not quite certain to be got over.

16,876. If you are convinced it would lead to greater safety and saving of lives or limbs of the men employed underground, would you not say it ought to be done?—I should do it.

16,877. I feel sure you would. I think you are a director of 11 companies?—Yes; I could not say the exact number.

16,878. Most of which are fairly successful?—Yes.

16,879. I am going to hint because you are a director they are successful, or is it because they are successful you are a director? I am not a director. I suppose there is a salary paid to directors of companies?—Yes.

16,880. In every case, as far as you know?—Yes.

16,881. Would I put it too high if I were to say mining managers like yourself get as high a fee in every case where you are a director of 10, 12 or 20 companies as the average colliery manager holding a first-class mining certificate gets?—No, the remuneration of a director is not on such an elaborate scale as that, so far as colliery directors are concerned.

16,882. Would I be right in saying your position with regard to the average remuneration, say, for 10 companies comes out at £300 a year?—No, not quite as much as that. Put it a little bit less; there is not much in it.

16,883. Would you be surprised to know a very considerable number of managers hold first-class certificates and are responsible for the management of mines who before the war had less than £300 a year?—Yes, I think it is a very great shame if they had.

16,884. We asked for the return from all mines of first and second class certificated men. With regard to the whole free owners of the mines and the holders of the royalties, you say there will be no incentive to gain, and consequently you would not get the best from men under nationalisation as under private ownership. You agree with that?—I think the incentive to gain does make a man put forward his best efforts.

16,885. What, would you say, men do not put forward their best efforts unless financial gain is behind them?—I am afraid, speaking generally, that I should not like to say that everybody does not work as hard when paid day wages as when he gets a little bit on the top for extra effort.

16,886. Are you aware there are 12 others here serving on this Commission without any hope of gain?—I am very glad to hear that.

16,887. Do you think Sir Adam Nimmo is doing his best?—I think so at the present time, but whether he would go on year after year doing that—he would get rather tired.

16,888. Did you not serve for some years on the Coal Organisation Committee?—I did.

16,889. Do you think you did good work on that?—I did my best.

16,890. Would you allow me to say you did very good work indeed, and the Government thought so too. Was it for financial gain you served upon it?—No.

16,891. Do you think I served upon it for financial gain?—We did not get much financial gain.

16,892. Did you not agree with Mr. Pease and other coal owners' representatives and three miners' representatives to ask the Government to fix the limit of the price of coal?—We did.

16,893. Were you not afraid that under competition the coal being scarce the price would go up out of the reach of the poor people of the country to get it?—That was our opinion.

16,894. Would it have been in your interests or the miners' interests if the price of coal should have gone up?—It might have been.

16,895. Did not the miners and the owners sacrifice themselves to see that the poor consumers of the coal got their coal at a reasonable price?—I think they looked at it from patriotic lines.

16,896. You have told us here and re-told us in your *précis* that under private ownership the consumer was protected?—I think he is.

16,897. By competition?—Yes.

16,898. There was nothing to protect the consumer until we stepped in and advised the Government to stop it?—That was the abnormal state of things.

16,899. The Government had to actually step in; then do you remember what you added to the recommendations? You asked the Government to fix the price at not more than 4s. higher than pre-war times. Do you remember that that was done on the condition that the Government would fix the price on each commodity in which the coal was to be used? Did the Government do that?—I am not aware they did.

16,900. I agree they did not. We fixed the price of coal to the communities that depend upon coal such as shipping and steel. Are you really afraid nationalisation cannot successfully undertake the production of coal? Are you afraid the nation would not get the assistance of such men as yourself and Sir Adam Nimmo and Mr. Cooper and the other gentlemen who know all about coal?—I do not know why they should not get the services of those men. At the same time I doubt if they would get any better results than they do to-day.

16,901. Would it not be putting men like yourself who know all about the coal trade down at a very low value if you said you would serve individuals but would not serve the State? Everybody during the last few years have given their services to the State and you are not afraid they would not get the best men in the country?—I think they would do their best to get the best men.

16,902. Do you know the real state of the accommodation the miners and children have been kept in for years and the great danger to life and limb underground? Do you not know that these things could be

13 May, 1919.]

MR. CHARLES EDWARD RHODES.

[Continued.]

improved by State ownership? If you believe that is so would you not fight for State ownership?—If I believed it was so I should fight for State ownership.

16,903. You do not think there would be any improvement in the conditions of the miners and their wives and children by State ownership?—I think they can be improved, and ought to be improved, without State ownership.

16,904. *Mr. Herbert Smith*: Did I understand you to say with regard to Sir Leo Money's question that the majority of the men working at your collieries ride to work?—I said I thought the great bulk did. They do at Monk Bretton.

16,905. At Frickley and at Grimethorpe?—I think they ride down one district.

16,906. Only one part. Three parts of the men there do not ride at all?—They can go down two ways.

16,907. North Staveley?—They do there.

16,908. Monkton?—I really do not know.

16,909. Monk Bretton?—They do there.

(The Witness withdrew.)

(Adjourned for a short time.)

Sir L. Chiozza Money: May I suggest that there should be circulated to the Commission the Government Bill establishing the control of electricity? I forget the exact title of it.

Chairman: Yes, I am much obliged to you. That is a very good suggestion.

Mr. THOMAS HENRY BAILEY, Sworn and Examined.

16,916. *Chairman*: If I might suggest to my colleagues on the Commission, perhaps when it comes to the cross-examination of this witness two gentlemen on one side and two gentlemen on the other would be quite sufficient to ask questions. Up to the present moment the Commission has asked 17,000 questions. I think perhaps we might have a little restriction in the number of questions.

Mr. Bailey says: "I am a Member of the Institution of Civil Engineers, Member of the Institution of Mining Engineers, Fellow of the Surveyors' Institution, Fellow of the Geological Society, and Senior Partner of the Firm of S. and J. Bailey, Mining and Civil Engineers, of Birmingham. My firm are mining advisers to the Duke of Buccleuch, the Earl of Dartmouth, and many others owning mineral properties in North and South Staffordshire, Warwickshire, Shropshire, Montgomeryshire, Northamptonshire, Rutlandshire, Yorkshire, Lancashire, Carmarthenshire, Dorset and Kent."

That is, *Mr. Bailey's* description and his many qualifications. I will ask you now, *Mr. Bailey*, to be good enough to read your report to the gentlemen of the Commission, beginning at paragraph 3.—There is a part of paragraph 2 that I should like to refer to.

"I have been a member of the firm for forty years. Of that time I was sixteen years resident in Glamorganshire, being general manager of the Hills Plymouth Company, Limited, when I developed the lower coal seams, and raised the output from about 250 to 800 thousand tons a year."

16,917. *Sir Allan Smith*: May I ask whether that is 250,000 to 800,000?—That is so.

"3. I have negotiated and carried through very many coal and ironstone leases, and I am well acquainted with the letting values as to royalties and wayleaves, and I have had many difficult and intricate problems to deal with, but only in one or two isolated cases have the negotiations fallen through. In not a few cases I have found it necessary to advise owners of minerals to give their lessees substantial assistance. Such cases as those mentioned by *Sir Richard Redmayne* are, I think, negligible and do not affect the necessary national output.

4. The proof and development of minerals of the nature of speculations have frequently been carried

16,910. Silverwood?—At Silverwood they do not. We are putting in a main and tail haulage now.

16,911. In five or six of the John Brown pits they only ride two?—Yes.

16,912. And in two or three other pits they do not ride?—They are making arrangements at those places, and the roads are being driven so that when they get further away they will be able to ride straight in.

16,913. The majority do not ride?—No.

16,914. *Sir Leo Chiozza Money*: On that, the answer given to me obviously was inaccurate and I want to put my question again. In the minority, and not in the majority, what is it that has stood in the way for the last 10 years in preventing such an obvious economy being adopted?—The newer collieries have not got far enough to make it worth while to run them in.

16,915. What has stood in the way of riding the men to work underground? Has it been conservatism, inertia, financial difficulty, or what is it that has stood in the way?—There is nothing that has stood in the way.

out by the mineral owners themselves, and the following are some of the instances where present or former clients of my firm have done so:—

- (a) The Earl of Dartmouth, between 1865 and 1869, had a series of boreholes put down on his Sandwell Estate near West Bromwich when his initial expenditure was about £2,000.

Upon this proof the Sandwell Park Colliery was established, and in 47 years has produced an output totalling nearly ten million tons.

Following this enterprise, my father initiated the Hamstead Colliery further to the north-east of the Eastern Boundary of the visible coalfield.

Lord Dartmouth has also made substantial reductions in the minimum rents of the Sandwell Park Colliery Company, and has also reduced the royalty from 6d. to 5d. a ton.

- (b) Lord Calthorpe in 1875 instructed my firm to undertake the proof of the Thick coal under his estate at Perry Barr, near Birmingham, and some £40,000 were expended thereon. The coal thereunder has for many years past been worked from the Hamstead Colliery.

- (c) *Mr. A. L. Vernon*, of Hilton Park, Wolverhampton, has on various occasions given substantial assistance to his lessees. Holly Bank Colliery, for instance, were exhausting the best seams on the east side of the Western Boundary Fault of the old coalfield, and *Mr. Vernon* contributed £40,000 out of royalties and has spent £68,523 in purchasing minerals under this area for the purpose of assisting the colliery company in their developments, straightening the boundary of his mineral estate, and leaving barriers for security against flooding his deep mines.

While little or no return has yet been received by *Mr. Vernon* from the money expended, the result has been that the mines on the down-throw side of what used to be known as "the Western Boundary Fault" near Wolverhampton have been proved, and workable coal extending under

13 May, 1919.]

MR. THOMAS HENRY BAILEY.

[Continued.]

many square miles outside Mr. Vernon's property is ready for development, from which Mr. Vernon will get no pecuniary advantage—in fact, for some time past the principals of the Holly Bank Company have been taking up leases and purchasing minerals under this area.

- (d) Lord Hatherton, the owner of the Teddesley Estate, situated to the south of Stafford, in 1897 gave my firm instructions to attempt the recovery of the lost shafts sunk sixteen years before at a cost of £100,000 by the Kindt Chaudron system, and which had been lying derelict. A sum of £35,000 was spent in recovering one of the shafts by securing the tubbing below the water-bearing strata, and sinking to a depth of 550 yards through all known seams of coal in the Cannock Chase district, which were found to be of exceptional quality and of an aggregate thickness of 97 feet. The result was the establishment of the Littleton Collieries, Limited, which have produced an output totalling 5 million tons up to the end of 1918.

The coal seams thus proved have been correlated with those of the Lilleshall Collieries in Shropshire, lying twelve miles to the west of Littleton, and there is no doubt that workable coals of great value are continuous throughout this area, and possibly extend to the North Staffordshire coalfield, many miles to the north. The royalty Lord Hatherton is receiving is 4d. a ton.

- (e) Sir Francis Newdigate, on his Arbury and Astley Estates, Warwickshire, in 1903 put down a borehole and proved the Warwickshire Thick coal. Afterwards Sir Francis Newdigate established the colliery, expending thereon about £190,000.
- (f) Lord Crewe helped the Madeley Coal and Iron Company with £12,000 when they were in difficulties which threatened the closing of the colliery.

5. Instances of such proofs and developments by owners of minerals up and down Great Britain could be multiplied, some even, like Lord Londonderry, Earl FitzWilliam and others, working their own minerals, to the present day.

The State has never undertaken either proof or development of the mineral resources of the country, and it savours of usurpation to suggest nationalisation now that mineral owners and private individuals have explored vast areas and recovered vast mineral wealth which was unknown only a few years ago. Such a policy is above all detrimental to the miners' best interests, for wages are kept up by the natural demand for labour, and capital expenditure upon colliery undertakings must be encouraged so that the increasing population may be absorbed and not come into competition with the men employed in existing collieries.

No matter what systems are devised for the distribution of wealth it will come back into the pockets of people who take care of it. It would, therefore, be wisdom on the part of the representatives of labour if they encouraged the use of capital upon industrial concerns instead of putting obstacles in the way of private enterprise.

6. In my experience royalties generally are now much lower than in former years, and, further, the percentage which royalties bear to the selling price of coal is continually falling.

The Holly Bank Colliery royalties in 1869 were 9d. to 6d. a ton, and are now 4s. to 3d. (75 per cent. or the output being at 3d.).

Lord Hatherton, in 1869, obtained 6½d. a ton royalty on coal in the Great Wyrley district, whereas 4d. a ton only is now paid in the adjoining area by the Littleton Collieries.

I put in three diagrams* :—

A general diagram showing the average selling price of coal from the pit head from 1882 to 1916 inclusive and the percentage which a royalty of 6d. a ton represents. A diagram 'A' showing the average selling price at the pit head of coal from a particular colliery from 1905 to 1918 inclusive and the percentage which the royalty of 4d. a ton represents."

May I explain that?

16,918. *Chairman*: If you please.—You will see a dotted line marked at the bottom of the paper—6d. a ton. Then you have a black line representing the average selling price from about 5s. 9d. to the present price, 15s. 9d., in 1916. When I made these diagrams I had not got the figures for the years 1917 and 1918 or else I would have added them. The shaded line shows the percentage of the selling price to the royalty. You get nearly 9 per cent. in 1882, down to a little above 3 per cent. in 1916.

16,919. What does that 1904 line show? The hatched line goes above the plain line.—It simply means that I have used the figures for the two purposes on each side; I have used it for the selling price and the percentage.

16,920. They have no relation to one another?—No, no relation.

16,921. Now to go to Diagram A.—Diagram A shows the selling price at the pithead of coal from a particular colliery from 1905 to 1918 inclusive and the percentage which the royalty of 4d. a ton represents.

16,922. *Mr. R. H. Tawney*: Is this a particular colliery?—Yes, one colliery.

16,923. The other Table was all the collieries?—The whole of the Kingdom.

16,924. *Chairman*: Now Diagram B.—

"A Diagram B showing the average selling price at the pit head of coal from a particular colliery from 1905 to 1918 inclusive and the percentage which the royalty of 6d. a ton (and the reduced royalty of 5d.) represents."

16,925. Now would you go on to paragraph 7?—

"7. Wayleaves are, as a rule, easily arranged, and in my experience vary from 3/16d. to one penny a ton. Immediate lessors are entitled to compensation of the nature of wayleaves as :—

(a) Their mines have usually furnished the proof of foreign mines."

16,926. *Sir L. Chiozza Money*: What is a foreign mine?—A foreign mine is an adjoining mine.

"(b) Wayleave workings interfere with and limit the getting of their own mines." That is to say, if a colliery is put down for an estate, the output of that colliery would all come from the estate were it not that roads were put into the mines beyond, so that the output from the property is reduced.

"(c) Surface wayleaves are frequently necessary and interfere with surface premises.

Wayleaves do not increase the price of coal—as the minerals subject to a wayleave charge usually pay a correspondingly smaller royalty."

16,927. *Chairman*: What sort of premises do you mean when you say "surface premises"?—The surface lands :—

"A Sanctioning Authority is desirable where wayleaves cannot be arranged.

8. I am of the opinion that nationalisation of mining royalties is bad for the following reasons :—

(a) As Mr. Smillie said at the Royal Commission on Mining Royalties in 1893 :—

"I do not think mineral royalties ought to be abolished at the present time. My reason for that is that in some districts there is a great deal more difficulty in getting coal: the coal may be thinner than in other places, and if mineral royalties were abolished altogether it would prevent

13 May, 1919.]

MR. THOMAS HENRY BAILEY.

[Continued.]

the thinner coal being wrought at the present time. Some employers, to my knowledge, would require to stop altogether, and the workmen would be thrown out of employment, because the employers could not compete in the market with those who were working thicker seams and a better class of coal. If royalties were abolished altogether, I believe it would lead to the stoppage of a good many mines that are going at present because the employers could not compete in the market with those who were more advantageously situated" (Smillie 5971).

(b) Royalty owners, in my experience, take a keen personal interest in the undertakings of their lessces, and under the powers of their leases exercise, by their agents, considerable beneficial control over the development of the mineral resources.

(c) It is entirely against the interests of the royalty owner that coal should be left unworked or wasted, and the royalty owner's surveyors, by making inspections and surveys of the colliery workings and seeing to the proper exploration of faulty ground, assist the State in securing the fullest possible output.

(d) In the event of nationalisation, all this work must cease unless a huge department is established and paid by the Government. The officials of such a department could not take the keen personal interest in the work such as is taken by royalty owners.

(e) In the majority of cases the surface and minerals are in one ownership and severance would lead to the following difficulties:

The surface owner, having no pecuniary interest in the minerals, would necessarily have all the common law rights of support and be entitled to compensation in the event of damage to land, drains, water supply, buildings, &c.

(f) Nationalisation would involve a loss to the public revenue.

At present royalty owners pay income tax on the gross amount of royalties received (in addition to mineral rights duty on the net amount, and possibly Increment Value Duty and Super Tax).

Strictly speaking, royalties are partly rent or income and partly capitalisation of assets. Valuations are always based on this fact, and the purchase price received for mineral properties provides the capital for a perpetual annuity in lieu of a terminable annuity.

The annual income from such perpetual annuity must necessarily be much less than that of the terminable annuity, and the revenue would lose the income tax on the difference, as well as the mineral rights duty.

Take the case of a mineral property producing a gross income of £1,000 a year to the royalty owner:—

The taxes are—

Income Tax at 6s.	£300
Mineral Rights Duty... ..	35
	£335

Possibly Increment Value Duty and Super-tax would also be payable.

Strictly speaking, only about £750 a year ought to be considered income, and £250 a year invested to replace diminishing assets.

Assume that these royalties are nationalised by the payment of 15 years' purchase of the income—i.e., £15,000.

The dispossessed royalty owner will be lucky if he can invest this in as safe an investment to produce

an income of £750 gross; that is £15,000 at 5 per cent.

The Income Tax on £750 at 6s.—£225—there would be no Mineral Rights Duty or Increment Value Duty—and the Super-tax (if any) would be less, so that the Revenue would lose at least £110 a year in the transaction."

That is to say, if you take £225 from the figure above £335, you get a difference of £110.

"I have no hope that the Government would reap any compensating advantages.

9. To arrive at a figure representing fair compensation for royalties, in the event of nationalisation, each case would have to be taken on its merits and investigation made of all the facts connected therewith, such as—

- (1) The state of development.
- (2) The number and character of the seams.
- (3) The regularity or otherwise of the measures
- (4) The royalties reserved.
- (5) Compensation for surface occupied, &c.

The settlement of claims would involve the employment of a large expert staff and the setting up of numerous arbitration tribunals. This work would take many years to complete.

The Finance Act (1909-10), 1910, under which it became necessary to make valuations of mineral properties, is nearly 10 years old, and there are still very many valuations remaining unsettled. Further, only those mineral estates which were not in lease at April, 1909, have had to be valued, and, consequently, there are numerous cases where no valuation of the mineral property exists.

The problem is by no means a simple one, and cannot be settled by a mere multiplication sum such as so much a year in royalties by so many years' purchase.

The question of undeveloped minerals is a more simple matter, as a valuation of most of these properties has already been either settled or discussed with the Inland Revenue Valuation Department.

It is difficult to understand how, in fairness, the Government could do otherwise than pay for all undeveloped minerals. It would involve an enormous capital outlay, from which no public revenue could be obtained for many years.

The Government have in many instances been paid Estate Duty on valuations which include the value of undeveloped minerals. In order to pay these duties in a great many instances the estates are burdened with mortgages, and royalties are the only means by which interest and the repayment of principal can be discharged."

16,928. *Chairman*: Will you kindly tell me what you say with regard to properties in which the existence of coal is uncertain but is suspected?—It has a value but a limited one.

16,929. How do you assess that value?—Where it is suspected?

16,930. Where the existence of coal is uncertain but is suspected?—In making valuations with the Department we sometimes put £3 an acre on it.

16,931. At a nominal sum?—Yes, at a nominal sum.

16,932. That means added on?—Yes, added.

"10. In my opinion no Government Department could supervise colliery operations with regard to barriers so effectively and conscientiously as the royalty owner. Moreover, the royalty owners, by their mineral advisers, have usually a complete knowledge of the problems involved in the settlement of local barriers and the dangers to be apprehended from any weakening thereof.

This knowledge could not well be available by a Government Department.

Nationalisation will not dispense with the necessity of barriers, and alteration of existing barriers would in necessary instances involve extreme danger to existing workings.

13 May, 1919.]

MR. THOMAS HENRY BAILEY.

[Continued.]

In my own practice I have never known any difficulty arise when a colliery company desires to work barrier coal when they are able to provide a substituted barrier or a safe scheme of working.

Barriers are not arbitrarily left round properties like ring fences, but are carefully designed by arrangement to the mutual interest of all persons concerned in the working of coal.

11. My idea of procedure to determine a fair value is as follows:—

- (1.) There should be a Commission appointed to determine the rates of interest to be allowed in calculating the value of royalties, and a table should be settled giving the number of years' purchase from one year upwards.

I find in practice that considerable differences of opinion exist, especially between Government valuers and private valuers, as to the proper basis of calculation.

- (2.) Each case must be considered and valued separately entirely on its own merits.
- (3.) The mineral values of the Inland Revenue should be empowered to meet the mining advisers of the royalty owners for the purposes of discussing, and (if possible, agreeing) on the nationalisation price. In the event of disagreement each party should make a report which should be considered by an independent tribunal consisting of, say, an independent mining engineer, a barrister, or solicitor, and an actuary—such tribunal being empowered to hear evidence and arguments and make awards as in arbitration.

Costs should be taxed and paid in all cases by Government on a predetermined scale.

I have read the Interim Report of Mr. Leslie Scott's Committee made to the Ministry of Construction in March last and referred to by Mr. Westgarth Forster Brown, and substantially agree therewith."

16,933. *Chairman*: Supposing the independent tribunal awards less than the Government offers, are costs still to be paid?—Yes, I think that the taxed costs certainly ought to be paid by the Government, unless of course there may be cases, as we all know, where people make absurd claims. Then if they do that and cause a lot of expense, I do not think they ought to be allowed costs.

16,934. That is what I was asking you, because you say "in all cases"?—I mean in all cases as a rule. What I mean is this: There may be cases where people act wrongfully in putting forward claims.

16,935. I see what you mean, but I thought you had not said that quite?—I know of a case that went to an arbitration about coal left under a railway. The owner claimed the actual value of the coal, as if it could be all got to-day. The arbitrator threatened to nonsuit him for it:—

"12. Royalty owners are not always persons with large incomes.

Some of my clients are people of limited means who depend very largely upon the mineral royalties they receive from small properties, and I also know that in many cases cottagers and small holders, including working miners, own the coal under their little properties and enjoy financial advantages therefrom.

13. At one time dues (amounting to 1s. a ton) were levied on all water-borne coal coming into London, the receipts therefrom enabling many public works and buildings to be constructed (Holborn Valley Improvements, for example).

These duties were abolished by Act of Parliament in 1889, and I would very much like to know into whose pocket the 1s. a ton ultimately found its way."

16,936. *Mr. Robert Smillie*: I notice you do me the honour of to some extent basing your opinion with regard to royalty rents on views which I have expressed in giving evidence before the Commission on royalties?—I do not think I could do better.

16,937. I sincerely hope you will keep of that opinion for a few minutes. You quoted my answer to Question No. 5971 on page 81. You quote the whole of my reply to that question?—Yes, I do.

16,938. The question that was put at 5970 was: "Do you generally agree with the opinion he has given?"—that is Mr. Robert Brown, the previous witness—and I say, "No, I do not." The next question is: "Will you explain where you differ from him?" Then you, in your *présis* to-day, quote the whole of my answer?—That is so.

16,939. The next question following that is: "What then would you propose? I think you would propose nationalisation of the minerals?" My answer is "Yes." Then all of the additional question is that the State should own the minerals. You were aware of that when you quoted this answer?—Quite so.

16,940. Do you think it was altogether fair to try to lead the Commission to believe that that was all that I expressed?—I take your answer for what it means—that the royalties ought not to be abolished for those reasons.

16,941. Why did you not quote further if you were really going to be guided in any way by my opinion? Did you not know my opinion with regard to the nationalisation of minerals?—I knew that, certainly.

16,942. Have you been guided to any degree at all by my opinion?—Yes, because you show that in certain instances it would be a mistake to abolish the royalties.

16,943. Are you in favour of nationalising the minerals?—No, I am not.

16,944. Then you have not been in any way guided by the evidence which I gave before the Royal Commission?—Yes, I think so.

16,945. I suppose you would agree with me that merely to abolish the charge for mineral royalties might have been then and might be now a serious matter to some owners. It would mean the shutting down of some pits?—Yes, I think it might, certainly.

16,946. I mean the difference between 3d. per ton royalty in one case and 1s. 3d. a ton royalty in another—that is 1s.?—Quite so.

16,947. That shilling may be the very factor which enables the colliery to be worth going on with?—That is so.

16,948. You know that is the reason for that reply—that I did not desire mineral royalties to be abolished—that they should continue, but that they should be taken by the State. You know that that was my opinion?—Certainly.

16,949. I think you said your firm were mining advisers to the Duke of Buccleuch?—Yes—not his Scotch mines—his English ironstone mines.

16,950. If you were advisers for the Duke of Buccleuch you would have to be responsible for all the sins of the Duke of Buccleuch, if he has any, whether in Scotland or anywhere else?—Quite so.

16,951. Do you remember the time when the late William Ewart Gladstone stood for Midlothian?—Yes, quite well.

16,952. You remember he stood against a Buccleuch?—You say so, but I had forgotten that.

16,953. Do you know that the Duke of Buccleuch said that if Gladstone won he would shut down his pits and that they would never be opened again?—I did not know that.

16,954. Do you know that Gladstone did win and the pits were shut down and the villages where the miners lived were demolished?—I did not know that.

16,955. Will you take it from me that that is so?—Yes.

16,956. And that you can see the ruin of the village there now. Do you think that is a power that ought to be in the possession of the Duke of Buccleuch or even of the King, to do a thing like that?—I should think it was a foolish thing to do if it is true.

16,957. What I asked you was: Do you think it is a power that they should have?—No.

16,958. Do you agree with me that they have that power?—Yes, they have that power.

13 May, 1919.]

MR. THOMAS HENRY BAILEY.

[Continued.]

16,959. Do you agree with me that that power should be taken out of their hands?—Yes. The proposal that is before the Commission puts forward a Sanctioning Authority, which would get rid of that.

16,960. I want, on behalf of the Miners' Federation, to thank you for the little sermon you preach on page 3 of your *précis*. You say: "No matter what systems are devised for the distribution of wealth, it will come back into the pockets of people who take care of it." Do you know that wealth from mineral royalties to the extent of from £120,000 to £130,000 a year goes into the pockets of certain individuals?—I do.

16,961. Do you say that they take care of it?—Are you not aware that some of them spend more than that amount every year?—I am quite aware that there are spendthrifts among the rich as well as among the poor.

16,962. Are those the people you say take care of it when it comes into their pockets?—No; what I mean is this: supposing you distribute the whole of these high royalties among the population to-day, it would come back again into the pockets of a few.

16,963. Would it come back into the pockets of the present holders?—That I do not know; I cannot say.

16,964. Your opinion is that supposing you divide up, as some foolish people say you should, all the wealth you have within fifty years some people will be rich and some people poor?—That is so.

16,965. That is so clear that it does not require any preaching to enable an intelligent person to know that it would be so; but in this case we find that the fact that some people are getting £120,000 or £130,000 a year without rendering any service to the country or to the State in any shape or form prevents the money produced by labour going into the pockets where it ought to have gone. Do you think that is a fair thing?—Yes, I do. It is the property of the owners, and they are entitled to whatever they can get for the sale of their property.

16,966. It is not the property of the owner till the miners go down the pit and go to the coal face and risk their lives to produce the coal?—I beg your pardon, it is the property of the owner when it is in the land. It does not become a chattel till the miners have cut it.

16,967. For instance, you cannot eat it so long as it is down there. It is only when it is produced that it is real wealth, is it not?—Quite so.

16,968. You say that it would be wisdom on the part of the representatives of labour if they encouraged the use of industrial concerns instead of putting obstacles in the way of private enterprise. Do you think that the leaders of labour do not encourage the use of capital?—Yes, I do.

16,969. Are you aware that we realise as fully, probably more fully than you do, that the best machinery that capital can produce ought to be used for the production of the commodity?—I know, but if there is this constant worrying of people who have got capital with regard to the conditions of the employment of the men going on, then if it prevents people from putting their capital into concerns which will benefit the working classes, that is not good.

16,970. Do you know that the leaders of labour protest, not against the use of capital in industry, but that they only protest against the division of the results of combined capital and labour—the division of the production? We protest against the wage-earners, miners or any other class of wage-earners, who work all the year round, finding themselves continually in poverty, badly housed, in bad health through bad housing, while people who invest their capital only and do not give any other service are living in luxury in mansion houses. Is labour entitled to protest against that?—You have certainly got certain difficulties that want righting. I love the miners, and some people say that working down the pit is a very difficult and very hazardous employment. I say I am never happier than when I am down a pit. I think it is one of the greatest treats I can have to go down a pit and go through the workings.

16,971. Perhaps if the miners were down the pit on the same mission as that on which you are down in

the pit, they would be happy too. Do you not think it makes a difference what persons are doing when they are down the pit, as to whether they are happy or not?—I do not think so.

16,972. Perhaps if the miner could change places with you at home, he would be happier?—I do not think they would be happy in my circumstances if they are not happy in their own.

16,973. Do not you think that the condition of lacking food or having plenty of food would make a difference?—I think that the cause of happiness depends on what a man is and not on what he has.

16,974. Do you think the environment has nothing to do with it?—No, and I will tell you why: It has been my privilege to go into many miners' cottages for tea and to visit, throughout my life, and I have been into cottages inhabited by men who have been getting perhaps their 30s. or their 25s. a week, with perhaps three or four children—beautifully clean cottages; and I have had cakes and things put on that table for tea which they could not beat in Buckingham Palace.

16,975. I agree. I could take you to houses of that kind, thousands of them; but would you say to a child to-day without boots, suffering from cold, "No, my dear, you are not suffering from the cold at all: you think you are"?—You do not mean to ask me whether I should be glad to see a child without boots?

16,976. A hungry miner cannot feel very happy?—I should want to go into the case and see what was the cause of his hunger.

16,977. I put it to you that you, going down into the pit and saying that you are quite happy there, have no right to say to the miners' children that they should be happy?—I have seen the miners down in the pits and I know they are happy to a great extent.

16,978. Very well, we will go home and tell them that they ought to be happy?—I did not say that they ought to be happy.

16,979. In what way have the representatives of labour in your opinion interfered with private enterprise?—By the constant strikes and the constant troubles that have been exerted against the employers, which have worried them out of their lives in a great many cases, and not reasonably. I quite agree with you that there are things which want putting right. I will give you a case when I went down to South Wales. I wanted to introduce systematic timbering into the mines there, and the colliers said no; they would not have it, and they struck, and they were out for some time until they gave way. Then they were working pillar and stall in the 9-ft. seam and they had got a sheet between each one of these in the road, and turning the air zig-zag all through the stalls till the atmosphere was not fit for the men to work in. I wanted to put in the long wall system, but no, they would not have it; they struck and they came out; but afterwards, when they tried it, they would not go back to the pillar and stall system. Then take, for instance, another case. There was a clod 9 inches thick in the 9-ft. seam. I went down and I settled 3d. a ton allowance for putting this clod aside. Then the clod went out of the seam, and I gave them notice to give up the 3d. Not they! They were going to stick to the 3d., and they were out for three months till it was sent for arbitration, and the arbitrator, a gentleman in Merthyr Tydvil, gave the men a halfpenny, which I had already offered them. Those are the things that want putting an end to.

16,980. I am sure you could go on for a week with that kind of thing?—Yes, I could.

16,981. Is that what you mean by saying the representatives of labour should not put obstacles in the way of private enterprise?—Yes.

16,982. Do you think we are here to-day still putting obstacles in the way of private enterprise?—I am hopeful that this is not going to be a still-born scheme. I hope that this is going to be something that will put an end to it.

16,983. It will put an end to it if we have our will?—I think you ought to be able to consider both sides without saying "our will."

16,984. I feel sure that there will always be trouble under the existing methods of working mines. I

13 May, 1919.]

MR. THOMAS HENRY BAILEY.

[Continued.]

think you are putting it too high when you say that the owners are complaining about it. I have never heard them complain about the matter, and I meet them very often. I do not think the mine-owners of Great Britain will bear out your statement when you say that we are putting obstacles in their way?—That is my opinion about it.

16,985. Were you a manager in South Wales?—I took the management of the works for the mortgagées: the company was bankrupt.

16,986. If they come to hear the views that you have expressed here to-day it would not astonish me in the least if there was trouble?—It is my view after the experience I have gained.

16,987. *Sir Adam Nimmo*: You were just dealing with the questions as to the relationship between owners and workmen under the existing system. Do you consider that if the mines were nationalised there would be less trouble between the workmen and the State than between the workmen and the present employers?—I think it would be worse.

16,988. Do you think that there would be more pressure by the workman upon the management under State ownership than there is at present?—I do. Supposing the royalties were taken over by the State, if Mr. Smillie could do it I believe he would worry the Members of Parliament and the Department until he got the whole of that money put into the pockets of the men.

16,989. Do you think that the very fact that the mines were owned by the State would supply additional reasons for the men making additional demands?—I do. I cannot see why five millions of the population should have preferential treatment. Why should not the seven millions of London come for preferential treatment? I cannot see why the mining class should ask for it.

16,990. Would the officials of the mines under State control and management have any real interest in resisting the claims of the men?—No. I think they would be placed in a more awkward position, because they would feel that the political interests would be against them.

16,991. That means, in other words, that there would be less likelihood of resisting demands in the direction of bringing about a strike?—Quite so. We had one case—a colliery that I know of—where the owner was a Member of Parliament for the Division. The result was that the management of the men was almost impossible.

16,992. So that you do not agree with the view that there is going to be a sudden reformation in the character of the workman simply due to the fact that he is working for the State and not for a private employer?—I do not.

16,993. I see that you believe in encouraging the workmen to save?—I do.

16,994. Do you think that if every workman became a capitalist to some extent and had an interest in the collieries that that would have a most beneficial effect?—I certainly do. I should be very glad indeed to see it.

16,995. Do you think that it would be more likely that we should have industrial salvation along these lines than along the lines of the demand of nationalisation?—I do.

16,996. You would like to see it worked and encouraged?—I should.

16,997. For the workmen to have a financial interest in the mining industry?—I should.

16,998. I see that you represent a good many interests in different parts of the country. May I take it that your view is that private enterprise has been quite equal to the mineral development that has been necessary to meet the national requirements in coal?—Certainly.

16,999. I suppose you agree that very large risks have been taken by those who have gone into mineral undertakings?—I do. Take the case of the Littleton Colliery: that was started and ten years went by before there was any dividend whatsoever paid to the shareholders. That is not an isolated instance. In many cases where these big developments have taken place it has taken years before the shareholders have got anything for their money.

17,000. Do you think we should have had the developments which have taken place under State ownership and control?—I do not.

17,001. So that the workmen and the citizens of this country have benefited to a very large extent by reason of the development having taken place through private enterprise?—Yes I should like to give this reason for that. What have the Government done? They have done nothing up to the present time to prove mines or minerals. They have not even taken the trouble to do anything for testing such questions as coal dust. Who was it tested the coal dust? It was the colliery owners, who at the expense of over £10,000, through Sir William Garforth, put down that testing plant and then found out everything about the difficulty and the danger of coal dust. Then the Government stepped in and put up the plant at Barrow-in-Furness to continue these tests, but what have they done? They have done nothing. The coalowners have found out everything that has been found out up to the present. Take, for instance, the Home Office on the question of the rescue apparatus. What happened with regard to that? It was foisted on the coalowners and found to be a deathtrap. It really does not make me have any faith at all in Government procedure when I see such things.

17,002. You think the owners are desirous to have the fullest possible development?—I do.

17,003. They have done everything they possibly can to prevent accidents?—Nationalisation will not get over the carelessness of men. The men will be the same. Take the Abercarnaid explosion in 1891. How did it occur? When we got back into the workings we found that the men had unscrewed the top of their lamps and that had caused the explosion. Then take, for instance, cases of falls of roof. You have in Mr. Johnson's district Report No. 8 for 1912 20 per cent. of the accidents from falls of roof are said to be through the carelessness or negligence of the men. I think it was Mr. Sidney Webb who said it was better for the colliery owners to have an accident than to spend money to put things right.

17,004. You do not believe that, I take it?—Of course I do not.

17,005. *Chairman*: Mr. Sidney Webb is not here at the moment. I think that was a misunderstanding of what he said. We will ask him about it when he comes back?—What I should like to put before you is this: there was the overwind at Littleton Colliery that cost £2,000 and the pits were idle for six weeks. We had to keep the whole of the underground workings in order through that six weeks and lost the money for the coal as well.

17,006. *Sir Adam Nimmo*: I suppose it is the case in the coal mining industry as it is in other industries that a certain number of men devote their lives to the industry?—They do.

17,007. And the working of the industry runs very largely in the families that have been associated with mining?—That is so.

17,008. They really become devoted to the working of the industry so as to secure the maximum of efficiency in every direction. Do you agree with that?—I do.

17,009. Do you agree that a great deal of individual enterprise has been put into the mining industry?—I do.

17,010. And that it has been steadily progressing on the side of scientific knowledge and skill?—I do—and practical skill, not merely depending on theory, but practical skill.

17,011. You have mentioned a point that I should like to expand a little bit. I understand you to say that you think in this matter of nationalisation the interests of those industries require to be taken into account as well as the interest in the mining industry of the miners?—I do.

17,012. How many men do you think in the industry of the country one miner's output of coal will keep going? How many men are resting on the work of each individual miner—would you say 6 or 7 or 8? That is to say, coal as a piece of coal is of no value in itself; it has to be destroyed and used before it becomes valuable?—That is so.

13 May, 1919.]

MR. THOMAS HENRY BAILEY.

[Continued.]

17,013. It is being used throughout all the industries in the country?—Quite so.

17,014. A miner, therefore, in putting out his coal has a large number of men who are dependent on his work?—That is so.

17,015. Would you agree that the interests of these men have to be very much looked into?—I do.

17,016. And taken into account in dealing with the question of nationalisation of mines?—Certainly.

17,017. And that we must have regard essentially to the effect of nationalisation upon the whole of these other industries?—Quite so.

17,018. As a matter of fact, would you agree with me in this, that inasmuch as one miner may keep 6, 7 or 8 men going we ought to have more regard to the interests of these other men than to the interests of the miners if we are to maintain the industrial position as a whole?—Certainly.

17,019. Is there not an additional reason for carefully considering the question of the nationalisation of the mines from the point of view of the character of the problem in this respect, that each particular colliery is presenting a separate problem of its own?—That is so; managed by people who have for years studied those problems, and if they were removed from that colliery I do not know what would happen.

17,020. And each colliery has to be studied by itself in relation to its own problems?—Certainly.

17,021. And the facts surrounding it?—Certainly.

17,022. Do you think these problems would be likely to receive the same close attention under State ownership as they do at present where the individual is closely watching them?—I think not. A case came before me a little while ago of a Government Office. There was an Army wagon with four horses, a corporal and six men, sent to an office in Whitehall to receive 1 cwt. of paper and take it to another office. If that sort of thing went on in collieries, I want to know how long they would last. It is the individual owner and employer who looks into these details and sees that there is no waste going on.

17,023. Where an individual owner has to face his difficulties, knowing that his money is at stake in connection with the solving of these problems, is he not likely to take greater care in dealing with the matter?—Certainly.

17,024. And to exercise more personal supervision?—Not only that, but his first care is the safety of the men and his second care is the safety of his property.

17,025. With regard to royalties, I understand you have very little experience of a sliding scale royalty?—Very little. We have had one or two, but we have none now.

17,026. May I take it that throughout your district it is regarded as an unsound principle?—It is, because the royalty goes up to an enormous figure with such prices as are being got now for coal, and the colliery owners do not like to pay such royalties.

17,027. I suppose the price, taken by itself, is no measure of the ability of the colliery to pay royalty?—No, because the difference between the high cost at the present time and the high selling price is a hardship on the colliery owner if he has to pay a sliding scale royalty.

17,028. I understand you have had very considerable experience with regard to the detailed working of collieries, as you have gone about the country, and you have come into contact with the managers?—I have.

17,029. Is there an increasing camaraderie among the managers throughout the country?—I should say so.

17,030. There is a kind of developing Freemasonry, is there not?—There is: they have their own associations now.

17,031. Are they contributing, constantly, papers to various institutes connected with the industry?—They are.

17,032. Is the knowledge developed in that way made available throughout the whole of the district,

and, ultimately, throughout the whole of the country?—It is.

17,033. Are the records of these proceedings published from time to time?—They are.

17,034. Do you deal constantly with the detailed problems of mining which are of interest to the whole mining industry?—I do.

17,035. Would you say that the facilities in that respect which are available just now are very considerable?—Very considerable, and increasing.

17,036. I take it that, as we go on, assuming the present system to be continued, this information will be more and more available and more and more disseminated?—It will.

17,037. *Mr. Sidney Webb*: I think you have made reference to something that I have been supposed to have said with regard to the prevention of accidents?—Yes, I did.

17,038. I think you have quoted a statement which purports to have been made by me to the effect that owners of mines neglected precautions because they were expensive. I am putting it summarily. You have rather suggested that I have said that?—I understood you to say it.

17,039. You have not heard what I said, perhaps?—Yes, I was here when you were examined.

17,040. May I read to you what I did say? The first reference was on page 493: "A whole generation of financial experience of the Employers' Liability Act—a couple of decades of the Workmen's Compensation Act—have demonstrated a fact of momentous significance, namely, that it usually costs less to compensate for accidents than to prevent them. This applies to a capitalist trust and to a separate ownership." That was my statement.

Mr. R. W. Cooper: Your previous statement was: "The enormous number of accidents caused by insufficient use of pit props to prevent falls of side or roof is very significant. Pit props are now expensive."

17,041. *Mr. Sidney Webb*: Yes, and there is a good deal more to that effect: "Such mechanical appliances as automatic contrivances to prevent over-winding, detaching hooks and cage gates are still not universal." Taking those statements, do you think those are incorrect in point of fact? Take the first one, for instance: Are automatic contrivances to prevent over-winding universal?—Yes, I think they are.

17,042. You are not prepared to say that they are in all collieries?—No, because I have never been in all collieries. They have to be put up under the Mines Act, and I cannot conceive that inspectors would go round the collieries and not compel them to be put in.

17,043. Of course, I have not been through all the collieries, but my information is that they are not universal?—I doubt it.

17,044. Then there is a further thing that I am indicted for, where I say that "the experience of the Employers' Liability Act—a couple of decades of the Workmen's Compensation Act—have demonstrated a fact of momentous significance, namely, that it usually costs less to compensate for accidents than to prevent them"?—I cannot understand where you got the information from. How do you say that it shows that it costs less?

17,045. Let us go on. "Of course, it is obvious that it is not possible to say what it would cost to prevent accidents"?—I should be very glad indeed if you could show how you are going to get over the carelessness and the wilfulness of the men.

17,046. That is another point?—Yes, but it is the accidents.

17,047. Do you say that all the accidents are due to the carelessness or wilfulness of the men?—No, I do not.

17,048. Let us leave those out of account and consider only those accidents that are not due to wilfulness and carelessness. I venture to put it to you that some of those accidents could be prevented: do you think that is an unfair statement?—Of course there are accidents which can be prevented: for instance, if I am crossing the Strand, I can prevent an accident by being careful.

13 May, 1919.]

MR. THOMAS HENRY BAILEY.

[Continued.]

17,049. I said, let us leave aside the accidents which are due to the carelessness of the workmen and their wilfulness, of which I admit there are a great many, and keep our minds on the other accidents, of which there are also a great many?—Yes.

17,050. You admit that some of those accidents could be prevented?—I think so.

17,051. It is clear we cannot say what expense would prevent them?—I can quite see that accidents could be prevented without any expense at all.

17,052. I say accidents not due to the wilfulness of the workmen which could be prevented without any expense at all. If I may quote a royal example, I would say, if they are preventable, why are they not prevented?—It is simply human nature on the part of both the manager and the men.

17,053. I am asking you to leave out those accidents which are due to the carelessness of the men?—I can take, for instance, the electric light cables: they may get worn and the tubs may rub against the cables and rub off the material which insulates them, and that causes a spark or something like that.

17,054. How could that be prevented?—That could be prevented by the manager seeing it as it goes down and having it repaired.

17,055. And also by more frequent inspection?—I doubt whether you could have more frequent inspection than you are doing at the present time.

17,056. Now let me go on to read you another thing that I said, at Question 12,178?—Before you read that, may I say something?

Chairman: The Commissioner is asking you a question on a certain passage, to which you will kindly give your attention.

17,057. *Mr. Sidney Webb:* On p. 522, at Question 12,178, I say this: "May I put it in my own way: I would say that a number of managers and owners of mines have desired to prevent accidents and have wished to discover means of preventing accidents, and have co-operated with the Home Office in preventing accidents. Some others have not, and the permanent pecuniary interest of the owners has been necessarily and innocently against any expensive precautions for the prevention of accidents, and they have, as a matter of history, resisted a number of proposals of the Home Office for such precautions"?—I do not wonder that they have resisted the Home Office in a great many instances. I gave you an instance of the rescue apparatus.

17,058. You do not think that that is at all an unfair way of putting it?—If you gave me the case, I think we should find that they resisted the Home Office proposal for a very good reason.

17,059. Yes, I have said so. Now let me read on; "Do you suggest really that owners object to putting in appliances that are prescribed because of the expense?—(A) Yes, certainly they do. They would not be profit-makers if they did not. They would be bad people of business if they did not object. There must be always an objection to any improvement, however valuable the improvement is, when it costs a great deal of money, and it is quite a proper objection." Do you think that is true?—All I have to say, as a practical man, with regard to this is that no owner would risk not putting in what he thinks is proper for the safety of his workmen.

17,060. Quite so. Now let me take the next question: "Are you not aware that the objection of the coalowners generally has been to the prescription of a certain kind of appliance?—(A) Quite so; that is the form the opposition always takes. No one is opposed to improvement in the abstract. It is only when a suggestion is made of a concrete improvement that it meets with opposition." Do you think that is an unfair way of describing it?—Because the particular thing that has been brought forward, I have no doubt, has had some very grave defects in it.

17,061. In the opinion of the owners?—Yes.

17,062. Then a few years elapse in the history, and we find that it has been adopted and is found to work quite well?—You get improvements in the particular thing and then it becomes a useful thing.

17,063. My point is that proposals that have been made have been objected to strenuously by the owners

because of the expense. They have given reasons why it is not a good improvement. They have been overruled. The improvement has been prescribed. They have adopted it and it has been found quite a useful thing?—The point I object to is this: You say because of the expense I do not think that is true.

17,064. Let me give you an instance. Some time ago I went into the question of the requirement of a second shaft. That was proposed for a good many years, and was resisted by the coal-owners on very specious grounds indeed—I mean quite apparently plausible grounds, that it would be no use to prevent accidents, and it was very expensive. In 1862 it was required, and now I do not suppose any colliery owner would dream of having a mine without a second shaft?—No, because the state of mining to-day is a very different thing from what it was then.

17,065. Do you suggest that the second shaft was not as necessary in 1862 as it is now?—For ventilation?

17,066. Yes, for the purpose of ventilation. Do you suggest that it was not necessary in the ignorance of ventilation that existed then?—It depends on the size of the workings.

17,067. Do you think any mine ought to be without a second shaft?—Yes, I have seen lots of little mines without a second shaft.

17,068. Do you think it ought to be so?—Yes.

17,069. At any rate my statement does not bear the interpretation, does it, that owners have refused to put in appliances to prevent accidents from any desire to have accidents? There is no imputation on the humanity of the owners there: have you found anything of that in what I have said?—I can only tell you the impression it left on my mind when you were giving your evidence. If you said you did not intend that, of course, I would take it from you.

17,070. Was there anything that I said that would lead you to believe that I thought owners were not concerned to prevent accidents?—I should like you to look at Question 11,792 on page 503.

17,071. Will you quote it, as I have not it before me?—"In the case I am putting to you, the loss which an employer suffers in the way I have described much outweighs anything he suffers under the Workmen's Compensation Act, against which he may be innocent? (A) Yes, I can believe that that is so. (Q) Therefore, to put it on the lowest grounds, there is the strongest possible motive, on the part of the employer, to obviate accidents? (A) To obviate fatal accidents. (Q) Now let us come to the non-fatal accidents. As you know, under the Workmen's Compensation Act there is a long-continuing liability? (A) Yes. (Q) That cannot be altogether satisfactory to the employer? (A) I quite grant that an employer has to pay for accidents. My case was that he would have to pay more for preventing them. (Q) There I join issue with you: I do not think he would. I notice that you refer to the Employers' Liability Act. That, I suppose, is a sort of historical reference. You know, do you not, that that Act was very limited in its scope?—(A) Yes, I remember that it was bitterly fought by the employers for a whole generation."

Chairman: Now need we pursue this subject?

17,072. *Mr. Sidney Webb:* Just one final question: Is there anything in that statement which at all implies that owners were not anxious to prevent accidents?—You say, "I quite grant that an employer has to pay for accidents: my case was that he would have to pay more for preventing them."

17,073. Do you doubt that?—I say in a great many cases he would not have to pay anything.

17,074. For preventing them?—Yes.

17,075. If he can prevent accidents without paying anything, is not that a worse indictment of the owners?—No, because accidents will happen without people being able to stop them.

17,076. You say that some accidents could be prevented at no expense to the owner?—I have no doubt of that.

17,077. Then why does not he prevent them?—An accident is an accident.

13 May, 1919.]

MR. THOMAS HENRY BAILEY.

[Continued.]

17,078. If it can be prevented, your statement is not accurate?—What I mean is that no amount of money you would spend would prevent an accident.

17,079. I am not talking about accidents which cannot be prevented, but accidents which can be. You have said that accidents which occur in the mine, other than those which are due to the carelessness or wilfulness of the workmen, can be prevented by the owners without any expense. Have you said that?—Yes.

17,080. *Sir Arthur Duckham*: You have seen a lot of mining?—I have.

17,081. I have not seen very much mining or mining conditions. I have been fearfully shocked by Mr. Smillie's statement about the starving miners and their wives. How many starving miners or miners' families have you seen in the last ten years?—Not one.

17,082. Then they must have been in Scotland?—Years ago I made a valuation of Merry Cunningham's works and collieries, and I never saw a starving miner then.

17,083. *Sir L. Chiozza Money*: Is it not true that in such an industry as mining, and in any industry generally, the financial pull on the capitalist is against safety conditions?—No.

17,084. How do you account for the Mines Act and its many clauses which enforced safety conditions: why were they necessary?—Because of human nature. It is like the Ten Commandments, or the Criminal Acts and the police and so so. If you have a standard up to which you can live, that standard is a help to everybody.

17,085. What part of human nature do you refer to?—I mean, human nature.

17,086. Forgive me, I asked you quite plainly this: Is not the financial pull against conditions of safety?—No, I should say not.

17,087. Are you aware that the very experienced mining engineer who preceded you did say that the financial pull was against the long wall system? Is that your opinion?—No, it is not. I was the one who made the report with regard to the fires at Bentley and Brodsworth Collieries. They were very serious. Through that report those fires have been absolutely got under.

17,088. *Mr. Herbert Smith*: That is not correct: those fires still exist?—They had about 40 or 50 there.

17,089. *Sir L. Chiozza Money*: Is it not the fact that in the opinion of a man well qualified to speak—namely, Mr. Stanley Jevons, the only disadvantage of the long wall retreating system of mining is that there is a poor return for a long time to the shareholders?—Take the case of the Sandwell Park Colliery.

17,090. I must ask you to answer my question. Are you aware that Mr. Stanley Jevons has said that?—I have never seen it.

17,091. May I ask you to read this passage: "The disadvantage of the matter is that a huge amount of capital must be expended and a considerable time lost before any considerable output can be obtained and the shareholders receive any return on their investments"?—Was he a mining engineer?

17,092. Mr. Stanley Jevons, like his father, was a very earnest student of mining. I thought, as his opinion was considered by your predecessor in the Chair to be valuable, we might treat it with consideration; but you do not agree with it?—No, I do not. The Sandwell Park Colliery has been opened on the retreating method of working.

17,093. Is it not the fact that you drive your roads right through and then retreat, closing up as you go, and is it not the fact that the roads are open a shorter time than they would be under the advancing system?—No, it is just the other way about.

17,094. Is it not the fact that if you retreat and close up as you go, you have not to travel over the road?—You have to get up to that back end.

17,095. In the other system you have to keep the whole road open up to the very end of the boundary?—It does not make any difference. We find the great difficulty is that fast roads do not stand as well as gob roads.

17,096. The fact is that you have to keep your long roads open up to the very time you reach the barrier, and in the other case it shortens in extent?—At a very slow rate.

17,097. You do admit that it does; indeed, it is obvious that it does?—I should say it is infinitesimal; it is not worth talking about.

17,098. In so far as it exists, it shortens the danger of the road, does it not?—I do not agree. I would much sooner have the gob roads than the fast roads. If I could take you down a pit where they have driven out to the boundary, like at Sandwell Park, and show you the difficulty with fast roads and the difference between that and gob roads, you would have a very different idea of the actual facts.

17,099. Is it not the fact that the long wall retreating system is a system which is gaining ground?—Yes.

17,100. Does that not mean that experience has confined its advantages?—Certainly.

17,101. Why do you disrate those advantages?—I do not.

17,102. You admit them?—Let me understand what you mean. The long wall system can be worked in two ways—out from the pit, or worked retreating.

17,103. I am speaking of the retreating system, and I am asking you whether it is not the case that the retreating system, as compared with the advancing system, gives you a shorter road?—It is not worth consideration.

17,104. Is it not obvious that the road closes up as you retreat, whereas, as you advance, you have to keep your road open?—You want to become a mining engineer, and then you would know that the arguments you are using now would not hold water.

17,105. They were admitted by your predecessor in the box?—I cannot help what he admitted; I cannot agree with him.

Mr. Robert Smillie: Mr. Chairman, would you allow me to say that Sir Arthur Duckham put a question to the witness as to whether or not he had known of any starving miners in the last 10 years. I never suggested that the miners were starving during the last ten years. I understood Sir Arthur Duckham said to Sir Adam Nimmo that it was scandalous.

Chairman: Sir Arthur Duckham is not here now, so we will leave it till he returns.

17,106. *Mr. Herbert Smith*: I want to ask you some questions about Yorkshire. Do you say that fires are not known at Brodsworth and Bentley?—I say no; practically they have been got over.

17,107. When you say "practically," what do you mean by "practically," because they have them now?—Yes, they have some, I know.

17,108. So that they have not got over them?—But practically they have done.

17,109. What do you mean by "practically"?—Before I made my report they had had some 50 or 60 at Brodsworth, and something like that at Bentley, and they have had nothing like it since.

17,110. As a matter of fact since your report we have had some fires as before?—At Brodsworth?

17,111. In those areas?—I have not heard of them.

17,112. What do you say has overcome them?—It is a long business to discuss.

17,113. What has overcome them?—I have not the report here to refer to. If you remember I gave evidence before the Gob Fire Commission, and put a tremendous lot of information before them. You can have the report if you desire it.

(The Witness withdrew.)

13 May, 1919.]

MR. CHARLES EVELYN FORESTIER-WALKER.

[Continued.]

MR. CHARLES EVELYN FORESTIER-WALKER, SWORN and Examined.

17,114. Are you a member of the firm of Bassett & Walker, Mining Engineers practising at Cardiff, and have you had 25 years' experience in the South Wales Coalfield, and are you a Fellow of the Surveyors' Institution and a member of the South Wales Institute of Engineers?—Yes.

Chairman: I will ask the Secretary to read your proof.

Secretary: "My firm act as mining engineers and mineral advisers to owners of large mineral estates in Monmouthshire and South Wales, comprising in the aggregate between 40 and 50 thousand acres with an average annual output of approximately 6 million tons, and the average fixed royalty works out at 5.408d. per ton, or about 2 per cent. of the cost of production, and the underground wayleave, where based upon tonnage, works out at about .805d. per ton.

In recent years, however, in many cases wayleaves have not been charged at all, and in other cases a nominal lump annual sum is charged for wayleave rights when exercised.

3. I have had considerable experience in letting minerals in South Wales, and the cases where negotiations have fallen through have been exceeding rare.

In my experience owners of minerals are only too ready and anxious to let their minerals on reasonable and fair terms, and the cases of "holding up" minerals have been very exceptional.

4. Where it might be contended that owners are holding up their minerals capriciously or are acting unreasonably I would suggest that an impartial tribunal should be set up to deal with such cases.

5. Generally speaking, mineral leases in South Wales are for a term of 60 years, which is the term authorised by the Settled Land Acts.

6. In the generality of cases the royalties are fixed, but there are cases where royalties are reserved, depending according to a sliding scale on the market price of the coal, but these are exceptions to the rule, and in the whole of the areas managed by my firm there is only one such case, and that on an insignificant area—viz., 264 acres.

7. The dead rents in most cases amount to £2 an acre, and this is generally the maximum, while the power to make up "shorts" is granted for terms of 3, 5, and 10 years, and in the case of smaller properties over the whole term of the lease.

8. In practically the whole of the leases which my firm deal with the lessee has the right to determine the lease by 12 months' notice, on the coal either being exhausted or found unworkable at a profit, and this I think prevails generally in South Wales.

9. In my experience royalty owners have been very ready to grant reductions of royalties and rents where the lessees have brought to their notice *bona-fide* reasons and arguments for some concession, and I may say that concessions amounting to over £100,000 have been granted by my firm's clients during the past 40 years.

The following are instances of concessions made:—

- (a) Between June, 1880, and June, 1895, the late Lord Tredegar granted to the United National Collieries, Ltd., concessions amounting to £39,426 4s. 5d.
- (b) In the years 1900 to 1908 the late Lord Tredegar, with the concurrence of the present Lord Tredegar, granted to the Tredegar Iron and Coal Co., Ltd., concessions equivalent to £50,500
- (c) In or about the year 1911 the royalty payable by the Main Colliery Co., Ltd., to the Lords of Neath Abbey was reduced from one-twelfth of the selling price to 5d. per ton through coal.

10. I am not aware of any difficulty arising in regard to lessees assigning their leases even when the covenant not to assign is unqualified, as lessors are generally quite ready to give their consent to assignments provided the assignees are respectable and financially responsible people. In practically all our leases there is a provision that such consent shall not be unreasonably withheld.

If a landlord should place obstacles in the way of an assignment I would give the lessee power to appeal to the tribunal.

11. Generally speaking, when leases expire there are seldom any "shorts" to recover, but in my experience mineral owners are quite ready to grant renewals of leases on reasonable terms and with power to make up shorts under the expired lease, and I have quite recently had occasion to advise this.

12. I have given careful consideration to the question of the nationalisation of minerals so far as it affects the South Wales Coalfield. Practically the whole of this field has been taken up and is being actively worked and developed, and this seems to me to weaken any arguments advanced in favour of State ownership or management.

13. The mineral owners do not insist on barriers being left round their respective properties, but only make it a condition that the lessee shall leave proper and efficient barriers round the taking as a whole, so that even assuming that the minerals were nationalised similar barriers would have to be left between the respective colliery takings as a protection against gas and water and to prevent the spread of explosions. In a fiery district like South Wales there would be a great risk of disastrous loss of life and great destruction of coal if sufficient barriers were not provided.

14. Generally I am of opinion that royalties have not interfered with the development of the South Wales Coalfield, but on the contrary have tended to equalise matters between those collieries where circumstances are favourable and those where the circumstances are not so satisfactory, and this has tended to the production of coal from low-grade mines, which might not otherwise have been worked.

15. The development of the South Wales Coalfield has been greatly due to the enterprise and expenditure of the owners of the minerals. A start was made by John, Marquess of Bute, the grandfather of the present Lord Bute, to whose expenditure on the construction of docks at Cardiff the development of the coal of the Rhondda and Aberdare Valleys is almost entirely due. The same applies to Newport, where owing to the promotion of the great docks there by the first Lord Tredegar, the grandfather of the present Lord, and the late Lord Tredegar, his uncle, and the expenditure by them of upwards of £1,000,000 in cash, the development of the Monmouthshire field has been much hastened and facilitated. The same applies to a great extent to the docks at Penarth, owned by Lord Plymouth, and the Barry Docks, in which his Lordship is also much interested. In more recent years the late Miss Talbot, of Margam, with the object of developing her minerals, spent an enormous sum of money in the construction of docks at Port Talbot, and of a railway leading to them. But for the fact that the Bute, Tredegar, Plymouth, and Talbot families owned large tracts of mineral property, it would not have been to their interest to make the great expenditure which they have in the development of ports through which the coal could be exported.

16. The present Lord Tredegar succeeded to the Tredegar Estates on the death of his uncle in 1913, and consequently has had to pay to the State 16 per cent. of the capital value of the minerals owned by him. The amount of this value has not yet been ascertained, but Lord Tredegar has already paid sums on account far exceeding any duty which can be payable in respect of the minerals. Miss Talbot also died

13 May, 1919.]

MR. CHARLES EVELYN FORESTIER-WALKER.

[Continued.]

quite recently, and a very large sum became on her death payable to the Government as duties in respect of the capital value of her mineral estate.

17. I object to nationalisation on the following grounds:—

- (a) The personal interest of the royalty owner in the development of the coal will be lost.
- (b) The difficulties which will arise by reason of the severance of the minerals from the surface.
- (c) If royalties are abolished altogether I believe it would have a tendency to discourage the working of a good many collieries that are worked at present.
- (d) If royalties are nationalised the inducement to owners to spend the compensation monies received in the neighbourhood of the minerals would be lost.
- (e) Loss of revenue to the State.
- (f) The creation of a large new Government department run at great annual cost which at the present time is borne by the royalties received by the owners.
- (g) That any mischiefs which exist to-day with relation to royalty owners are of a minor character and can be efficiently and satisfactorily remedied by means other than nationalisation.

18. Assuming mineral rights are nationalised, it is my view that for both let and unlet minerals all the circumstances relating to each particular case would have to be taken into consideration in arriving at a valuation.

19. I should like to refer to certain questions put to Mr. Arthur Francis Pease by Mr. Robert Smillie on the 13th March, 1919.

One of my clients is Lord Tredegar, who is the owner of the "Park Mile Railway" referred to in questions number 7745 to 7750.

Every statement of fact in those questions is incorrect and misleading.

The Park Mile Railway, though nominally a mile in length, consists of three double lines of railway, or six miles in all. The whole of this railway has been constructed, repaired, and renewed by the present Lord Tredegar and his predecessors in title at their own cost.

The original double line was constructed under the authority of the Sirhowy Railway Act, 1802, 42 George III., C. 115, under which Sir Charles Morgan, the great-grandfather of the present Lord Tredegar, was authorised and required to make that part of the Sirhowy tramroad passing through Tredegar Park. All persons were entitled to have free use of this tramway, and Sir Charles Morgan and his successors were empowered to charge in respect of the traffic the same rates, tolls, and duties as the Monmouthshire Canal Navigation were empowered to charge by that Act.

Under 8 and 9 Vic., C. 169 (1845), Sec. III., Sir Charles Morgan was required within three years to adapt the tramroad for the use of the engines and carriages of the Monmouthshire Co., and the powers given to that company to improve their railways were conferred upon Sir Charles Morgan with regard to the Park Mile. Under Section 129 the Monmouthshire Co. were required to carry passengers, animals, and goods over the Park Mile and to account to the owner for the tolls which might equal but should not at any time exceed the railway tolls for the time being taken by the company for their portions of the tramroad.

Under the Monmouthshire Railway and Canal Act, 1853, 16 and 17 Vic., C. 195, Sec. 42, the Monmouthshire Co. were empowered to convert the part of the tramway passing through Tredegar Park into an edge railway.

Under the Great Western Railway Act, 1875, 38 and 39 Vic., C. 124, Sec. 12, if the Monmouthshire Co.

should construct two additional lines of railway between Nine Mile Point and Waterloo Junction at Newport, and Lord Tredegar should do the same with regard to the Park Mile, then certain railways authorised by the Act should not be constructed.

Under this Act an agreement with the G.W.R. for the second double line through Tredegar Park was made.

Under the Pontypridd Caerphilly and Newport Railway Act, 1883, 46 and 47 Vic., C. 180, it was provided that the original double line then used by the G.W.R. should be handed over to the Pontypridd Co., that the second double line not then yet constructed should be provided for the G.W.R. Co., and that a third double line should also be provided for them instead of the second double line originally agreed to be provided for their use.

Under this Act Lord Tredegar was entitled to mileage road tolls in respect of their traffic passing over his line at a rate not exceeding the lowest mileage road toll charged by the Pontypridd Co. for the use of their railway adjoining.

Disputes and litigation having taken place between Lord Tredegar and the Pontypridd Co. under the Alexandra, Newport, and South Wales Docks and Railway Act, 1896, 59 and 60 Vic., C. 192, Sec. 13, the Pontypridd Co. were to pay to Lord Tredegar instead of the tolls payable under their Act of 1883, a toll at the rate of 26d. per ton per mile on traffic of all descriptions other than passenger or coaching traffic passing over the Park Mile except in cases where a higher through mileage rate than 60d. per ton per mile was charged by the Pontypridd Co. or other companies using their railway.

Consequently Lord Tredegar is, under the various Acts, in the position of a statutory railway company, and is entitled to charge in respect of the railways constructed and maintained by him the same road toll as is charged by the companies using his railway in respect of their adjoining railways and no more. It is quite immaterial to the freightier that this particular piece of the railway route happens to be owned by Lord Tredegar as he only pays exactly the same for carriage on his goods as if it were owned by the company through whom they are consigned.

In respect of this one mile (or six miles) of railway Lord Tredegar is in exactly the same position as any railway company over whose lines another railway company have running powers."

Chairman: The members of the Commission will be able to see the various Acts of Parliament referred to in that statement.

17,115. *Mr. Frank Hodges:* Are you what one might regard as one of Mr. Pawsey's witnesses?—I represent a considerable number of the royalty owners in South Wales, and I am associated with Mr. Pawsey's Mineral Association.

17,116. Are you financed by the members of the Mineral Owners' Association?—We have a separate Association in South Wales, which is more or less associated with Mr. Pawsey's Association.

17,117. Do you remember when you became affiliated?—Quite recently.

17,118. Since this Commission has been sitting?—Yes.

17,119. In other words, you formed yourselves into a sort of trade union?—That is what it amounts to. We are following your good example.

17,120. Is it not a trade union in restraint of trade?—No, I do not agree with you there.

17,121. I see, acting for your clients, you apparently represent an output of something like six million tons per annum?—That is so.

17,122. Do you agree with a previous witness that your clients do not perform any real economic function in coal production?—They do not actually produce coal, but they let their coal and let their minerals to various lessees who actually work the coal.

17,123. But they employ human legal agents and mineral agents to do all that for them?—But we take

13 May, 1919.]

MR. CHARLES EVELYN FORESTIER-WALKER.

[Continued.]

their instructions. We advise them, and in some cases they follow our advice. Sometimes they differ a little.

17,124. For example, did you ever have to put it to the late Miss Talbot as to how she would develop her mineral property?—I am afraid I did not act for her.

17,125. I thought you did, because you refer to her?—I referred to her as developing part of the Port Talbot Docks and Railway.

17,126. As a man of business, does it amount to this, that because mineral owners are so inadequately equipped to look after the proper administration of their mineral rights, a lot of people, mineral agents and lawyers, are quite as much interested in maintaining the royalty system as the owners themselves?—Of course the owners are obliged to employ some one to do their work; they could not do it all themselves.

17,127. So that the only function they perform is the function of letting?—Yes.

17,128. We will not go into the question of the rights of property, because that has already been exhausted in this Commission. So far as I know, you have, as I think I ought to say, an excellent reputation for the class of work which you are engaged in?—Thank you.

17,129. Would you be less efficient if you were exercising your abilities for the benefit of the State instead of exercising them for the benefit of the people who own this property at present?—No doubt I should do my best, but I tell you quite frankly I should not like to work under the State.

17,130. Have you had an opportunity of testing it?—I never want to if I can avoid it.

17,131. It is a case of taste and try. Then the next point you make in your *précis* is this. You devote some space to showing what concessions have been made by your clients from time to time?—That is so.

17,132. Am I right in drawing the inference from that that royalties have been gradually lessening in amount?—No; you are to draw the inference that royalty owners on the whole treat their mineral lessees very reasonably.

17,133. No; you say concessions have been made. That is to say, I presume, that the amount per ton was reduced?—In one instance, yes. In Instance No. (c) the royalty was reduced there.

17,134. And in the case of the other two I noticed in 15 years Lord Tredegar granted concessions to the United National Collieries, Limited, amounting to £39,426?—Yes.

17,135. And Lord Tredegar also made a concession to the Tredegar Iron and Steel Company of £50,000 in 8 years?—Yes. That concession to that company was with the object of trying to get them to reinstate the ironworks at Tredegar.

17,136. What is the inference that one must draw from this? Is it not a right inference to draw that the colliery owner, the lessee, is always feeling a sort of strangling hand round his neck—the strangling hand of the mineral owner—and that from time to time he gets a little relief, because the owner relieves the pressure and lets him the coal at a little less amount per ton?—Not at all.

17,137. Is that not a right inference?—No.

17,138. What inference is one expected to draw from the statement?—As I told you, that £50,000 was waived to the Tredegar Iron Company in the hope of persuading them to reinstate the ironworks at Tredegar, so that employment might be given to the workmen at Tredegar Town.

17,139. Purely in the interests of the workmen?—Absolutely.

17,140. Let me accept that for the moment because I have no means of verifying it in any other way?—You may take it from me that I would not tell you if it was not so.

17,141. Quite so. Where you have a concession made from 8d. a ton down to 6d. a ton it is the result of an application made to you by the colliery proprietors, is it not?—Yes, generally speaking.

17,142. I have noticed, not only in your *précis*, but in the *précis* of the mineral owners previously in the box, that they make a point of the readiness of the land-owners to make concessions?—We do that because, I think, you are a little inclined to treat us as if we were avaricious and greedy, and we are not.

17,143. Under pressure you make concessions to colliery owners who are in difficulties?—No, not any one of these were given under difficulties.

17,144. I am speaking of the rate per ton. Have you among your clients any particular mineral owner who has granted concessions to a colliery owner without being asked?—No, I cannot recollect one at the moment.

17,145. That is to say, when colliery companies are in difficulties they make application for concessions?—Some of them make the application before they are in difficulties.

17,146. And do they get them?—Sometimes.

17,147. Even when they are not in difficulties? Now my whole point—and I think it is rather borne out in your evidence—is that the colliery owners feel the weight of this system more than anybody else and that in order that they may live they have to make application to you for concessions and in order that your clients may live you give concessions, and you will continue to give concessions until you have only a penny a ton on your royalties. Is that not the fact?—We give them concessions where we think the case is such as to warrant it, but I do not quite accept your statement that they feel this weight as if it were strangling them. I do not quite agree with you there.

17,148. As a matter of fact, out of the 6 million tons at 5½d. above named, after paying all your taxation, I gather your net income for your clients would be something in the neighbourhood of £34,000. Approximately you draw £137,500 per annum at 5½d. a ton?—Yes.

17,149. It has been estimated that the taxation is three-fourths of that. Do you agree with that?—I daresay it would amount to that, but it would not in all cases.

17,150. Have you ever regarded that taxation as unjust?—Under the circumstances and having regard to the fact that we have been at war, one cannot regard it as unjust. Everyone has to pay their proportion. I may say at once I should be very glad to see a relief.

17,151. So that, as a matter of fact, it is wrong to value your property, or the income of these people, at anything like the gross amount, when in actual figures the actual return to the owners is only one-fourth of the total amount?—It is at the moment.

17,152. So that if the nation were compelled to buy out the interests of your clients, as they might have to do later on, the fact that three-fourths of the gross amount are already taken into the Exchequer by taxation would have to be a big factor in determining the amount?—Yes. I am hopeful, however, that that three-fourths are not going to continue for ever.

17,153. *Mr. Evan Williams*: A considerable amount of the State taxes is in the nature of Income Tax and Super-tax, is it not?—Yes.

17,154. Is the question of Super-tax or taxation of that sort taken into consideration in fixing the value of the property?—In valuing we generally value the thing as a whole amount.

17,155. Without taking the rate of Income Tax for the time being into account?—Yes.

17,156. So that it would not be fair to take it into account?—Yes; for valuations for Government purposes we value it on the gross, and do not take the Income Tax into account.

17,157. Nor Super-tax?—No.

17,158. So that it is not fair to suggest that the compensation to be paid to a royalty owner should be based upon the net amount he keeps in his own pocket?—It hardly seems so, seeing we are valuing every day on the gross for Government purposes.

17,159. *Mr. Hodges* asked you some questions. Every colliery owner knows every other colliery owner pays royalties?—Yes.

17,160. So that there is a burden on the coal industry to that extent?—Yes.

13 May, 1919.]

MR. CHARLES EVELYN FORESTIER-WALKER.

[Continued.]

17,161. And he knows the position can be relatively improved by getting a concession if he can?—Yes.

17,162. So that he is in rather a better relative position to someone else if the occasion warrants it?—Yes.

17,163. If there were no royalty, would there be anything of the kind which could change the relative position?—No, there would be no elasticity whatever.

17,164. I gather you are in favour of setting up an authority which would have jurisdiction over the letting of coal?—Yes.

17,165. And future lettings?—Yes.

17,166. Do you agree that the body should have interference in the present lettings?—If there was anything unreasonable cropping up, I think I should be prepared to agree to some authority such as is suggested in this Interim Report.

17,167. You would give also the right of appeal?—Yes. No one can cavil at anything which is reasonable. If anyone behaves unreasonably, it should be put right.

17,168. Even in the case of a lease which had been running for some time?—Yes, if there is anything unreasonable in it. I presume no one wants to be unreasonable.

17,169. Any point of difference which might arise between lessor and lessee you agree should be referred to this body in the absence of settlement between themselves?—Yes.

17,170. Would you extend that to the case of the making up of shorts, and so on?—Yes.

17,171. Generally do you find that lessors are averse to granting extension of average clauses where the company cannot make up the shorts?—No; not a single one of my clients has ever objected to extend the average clause where shorts have not been recovered.

17,172. Although the prescribed average period in the lease may have expired?—Yes.

17,173. And a great many of the modern leases have a period extending over the lease?—Yes.

17,174. In your experience would there be many cases in the past where appeal to a body of that sort, which we have been talking about, would be necessary?—No, it would be only in very, very rare instances. I do not think I can call to mind one in my experience where it would be necessary—certainly not more than one or two.

(The Witness withdrew.)

Mr. THEODORE VACHELL, Sworn and Examined.

Chairman: This witness is Mr. Theodore Vachell, who is a mining engineer of Cardiff and Newport. He says:—

“1. Witness has been in practice as a civil and mining engineer at Cardiff and Newport for upwards of 40 years.

2. The South Wales Coalfield is about 650,000 acres in extent. Of this area, not more than 10 owners hold over 10,000 acres—the remainder, and far the larger portion, is held by smaller owners, varying in area from 5,000 acres to as little as five acres.

3. During the last 25 years very large areas of mineral properties have been sold by public auction, and, within my own knowledge, over 15,000 acres were sold by two auctioneers—and considerable areas have also been sold privately, the purchase moneys being investments of capital.

4. The average royalty in Monmouthshire and South Wales is rather under sixpence per ton.

Wayleaves vary very considerably—in a very great number of instances no underground wayleave is payable. In others a fixed annual sum is payable when wayleaves are exercised while in some cases a tonnage wayleave is payable.

In numerous instances owners have received no income from their minerals. It would be manifestly wrong and unfair that, after waiting for several years, they should now be deprived of their minerals unless they are paid for at a fair valuation.

5. I act as mineral agent for many different owners of mineral properties in Monmouthshire, Glamorganshire and Carmarthenshire, comprising an area of about 12,000 acres. The output of coal for royalty from the properties I represent, for the last completed year was 2,665,980 tons, and the gross income derived was £70,520. The quantity of coal subject to wayleave for the last completed year was 1,277,533 tons and the income derived from wayleave was £5,242.

6. In one instance the properties were purchased for the purpose of working the coal. A large sum was expended upon developing collieries, and a very large quantity of coal has been worked, and one of the collieries is being worked at the present time.

7. Another property for which I act belonging to a limited company comprising iron works, collieries and a large area of mineral property was purchased in the year 1872, and with additional properties purchased subsequently, cost about £500,000. The iron works and collieries were worked until 1878, when, owing to the working being unprofitable, they were closed.

The iron works and iron mines were never restarted and were dismantled, but the coal property was leased to various lessees at moderate royalties, averaging about 6d. per ton, and thereby the Company has since been able to pay instalments of dividends to the Preference shareholders. The Ordinary shareholders have received no dividend.

If these minerals are nationalised without the payment of full compensation the Ordinary and Preference shareholders may lose the money they have invested in the undertaking.

8. Another property for which I act was purchased and left under the will of the late Charles Williams for the endowment and support of schools at Caerleon, where about 450 children are educated. This property includes some mineral property, which at present brings in an income of about £670 per annum, but when the minerals are worked the income will be about £1,500 a year or more.

9. Another property was bought in 1878 for £33,000. For many years after it was purchased no income was obtained from the minerals, and it was not worked until the year 1892.

10. I know of no instances where minerals have been held up unreasonably, neither do I know of any cases where power to determine or assign leases has been unreasonably withheld, but if such cases have arisen I see no objection to the matter being referred to an independent tribunal for settlement, and think that the proposals of the Mining Sub-Committees' Report, *re* the Acquisition of Land for Public Purposes, cannot be improved upon.

11. In my opinion nationalisation of minerals is absolutely unnecessary, it will be a great loss to the State because the Income Tax will be largely reduced, Mineral Rights Duty, Excess Mineral Rights Duty, and in some cases Super-tax will be lost. There will be no saving in barriers or in the quantity of coal worked, and I am quite satisfied that the properties are worked efficiently under private ownership, and there is no doubt, in my opinion, that the properties are more expeditiously developed under existing conditions than they would be under State control.

12. Housing.—I have had considerable experience as to this and for many years have taken great interest in the subject, and in the last 20 years I have leased many hundreds of plots of land and houses to colliers and colliery workmen.

13. I have also, on behalf of mineral owners, been interested in assisting to establish garden cities at Oakdale and Markham.

13 May, 1919.]

MR. THEODORE VACHELL.

[Continued.]

The Oakdale Garden City was established in 1912, and up to the present time about 200 houses have been erected. These houses are of a superior character and the scheme is progressing.

The Markham City was also started in 1912, and there are about 100 houses already erected and a large area of land has been acquired from Mr. Brewer Williams for the extension of the village.

Pengam Garden Village also contains about 100 houses, all of which have been erected within the last 10 years.

The land is let on most reasonable terms, and modern and suitable houses have been erected in all cases, the workmen being encouraged to purchase their own houses.

My experience is that good workmen have good and comfortable houses, but the unsatisfactory workmen have poor and uncomfortable homes.

14. It has been generally recognised that improvement in housing is necessary, but it is very wrong to say nothing has been done in the years immediately preceding the war."

17,175. *Mr. Frank Hodges*: You are mineral agent for Lord Tredegar?—No.

17,176. I see in paragraph 11 of your *précis* that in your opinion nationalisation of minerals is absolutely unnecessary?—Yes.

17,177. It would be a great loss to the State because the Income Tax would be largely reduced, mineral rights, duty, excess mineral rights duty and in some cases super-tax would be lost. It is because you fear that those will be lost to the State that you oppose nationalisation?—My opinion generally is that if you remove the competition and do away with private enterprise it will be a very great national calamity.

17,178. Look the facts in the face. The things that you refer to in paragraph 11 take 75 per cent. of the gross return to the mineral owner into the Exchequer?—I agree.

17,179. What great impelling force is there for private mineral owners to work their properties if the State takes $\frac{3}{4}$ of the proceeds from them? Where does the incentive come in?—They only take $\frac{1}{4}$ of the income to-day on account of the war-taxes. They do not in normal times.

17,180. That is the whole point. You said that the reason why you oppose nationalisation is because this $\frac{3}{4}$ will be lost to the Exchequer?—Yes, clearly.

17,181. When I put it to you that the net income is only $\frac{1}{4}$ of the gross income, you say, "Yes, that will not always be so"?—Only $\frac{1}{4}$ of the income now. It will not be after things settle down. It was not so before the war.

17,182. I trust you will endeavour to keep the argument consistently in your mind. You oppose nationalisation because of this loss to the Exchequer. You are still hoping, are you not, that that form of taxation will not exist for very much longer and that you will be relieved of having to pay that?—That portion of it.

17,183. Do you think one quarter of the gross income is sufficient to supply the mineral owners with the money for their agents, for their lawyers, their land agents and their bailiffs; do you think that is a sufficient income for them to live upon?—For the time being it has to be. That is all we can get out of it.

17,184. Do you mean to say if there was a little more than one-fourth available these parties who really administer the minerals would be out for a larger share in the proceeds?—Clearly.

17,185. You would gradually squeeze the poor owner out of existence?—Not at all. We hope to get relief from taxation. That is when we should get our increased income. We should not get any more from the lessee than to-day, but we should have to pay less in taxation.

17,186. Your position is this, if I may put it in a brief sentence. You are pitting your individual interests against what are urged to be the national interests?—I do not agree with you there. I do not follow you quite.

17,187. You hope by relief of taxation you will get a bigger pull out of the proceeds of the minerals?—Yes.

17,188. *Mr. Evan Williams*: With regard to the housing, you know South Wales from one end to the other?—Yes.

17,189. Would you say the housing conditions in South Wales are bad?—I consider in the colliery districts they are not bad. Of course, there are bad spots, I agree, but taking it generally my opinion is that the housing of the colliery class is quite as good, in fact better, than any other class of workman.

17,190. At the time the houses were built colliers' houses in South Wales have been rather in advance of the ordinary houses built?—Quite as good.

17,191. Quite as good, if not more so?—Quite, at the time they were built.

17,192. The houses put up at present for colliers are very good houses?—The house that is put up to-day is an excellent house. I have a scheme for the Oakdale Village. There they put up semi-detached houses or blocks of 4 or 6, and those houses are excellent. There is plenty of air-space left for them. I do not know if you care to look at this plan that was prepared in 1912. We are working on the scheme at the present time and already 200 of these houses have been put up. (*Handing plan to the Commission.*)

17,193. That is the Oakdale Village?—Yes.

17,194. *Chairman*: What is the nearest station to that?—Blackwood. It is on the top of the hill.

17,195. *Mr. Evan Williams*: You have not a photograph showing the type of house?—I could get one; I meant to have had one.

17,196. How many rooms have they?—A good parlour, a good kitchen, and a good back kitchen, and scullery, and 4 bedrooms upstairs.

17,197. A bathroom?—No, that has not been found necessary because in this district we are very short of water, and it is impossible to supply baths with water. There is really hardly sufficient for drinking purposes and ordinary domestic purposes, so it would be useless to put up baths in a district like that at present.

17,198. A large number of houses in South Wales have been built, and a great many more owned, by the workmen themselves?—I have let hundreds of plots of land to workmen for erecting their own houses, and within the last 20 years I have sold houses to workmen who, if they had been bad, could adapt them to their own requirements, and they are all perfectly satisfied living there in their own houses now.

17,199. Do you know from your experience whether the collier in South Wales does build or buy his own house rather more than any other class of workmen?—My experience is, a collier prefers that class of investment to anything else; he likes to live in his own house.

17,200. And in proportion more colliers own their house than any other trade in South Wales?—There is no doubt the collier owns a great many more houses than other artisans.

17,201. Anything said at this Commission about housing in your opinion does not apply to South Wales?—I do not deny there are spots in South Wales that are very badly supplied with houses.

17,202. With regard to the supply of houses?—Some of the houses are very inferior in character, but they are being improved as fast as is possible. In fact, I have before me three schemes for the Local Authority in South Monmouthshire district to put up about 500 houses as soon as they can get power to build them.

17,203. Are they being put up by a colliery company?—No, by the Local Authorities. That is in addition to the schemes that are going on for garden villages.

17,204. *Mr. Hodges* in his question to you put to you that three-quarters of the gross royalty is taken from landlords at the present time. Is not that an exaggeration?—I accepted that figure. A very large proportion has to go in taxation. I do not know that it is three quarters.

17,205. I do not know if you heard some of the big landowners give their evidence. Did you hear that from the Duke of Northumberland 11s. 6d. was

13 May, 1919.]

MR. THEODORE VACHELL.

[Continued.]

taken?—I think three-quarters was an exaggeration. It amounts to a very considerable amount in taxation.

Mr. Frank Hodges: The figure one-quarter has been put in evidence by witnesses on behalf of the mineral owners and three-quarters was taken up by taxation. If Mr. Williams looks up the proceedings of the last day or two he will find that is correct. Mr. Williams said I was exaggerating when I said three-quarters; I was quoting from previous witnesses.

Mr. Sidney Webb: It depends whether you take insurances, &c.

Mr. Evan Williams: That would make it less than 11s.

(The Witness withdrew.)

Mr. JESSE WALLWORK, Sworn and Examined.

Chairman: Mr. Jesse Wallwork is the mining agent for the Bridgewater Estates, owned by the Fourth Earl of Ellesmere. I will ask the Secretary to read his *précis*, and then I shall ask Mr. Herbert Smith and Mr. Cooper to examine this witness.

Secretary: "Lord Ellesmere is the owner of the Bridgewater property, comprising 16,593 statute acres situate in Lancashire.

Mines have been worked in the Lancashire estate for centuries past, and are still being worked.

The Worsley and adjoining area has always been worked by the owner. The average royalty now is 4.03d. per ton.

The outside mines—situated chiefly in the Wigan District—are worked by lessees at an average royalty payment of 4.9d. per ton.

Coal exists under the whole of the Lancashire estate.

The ancestral estate is at Worsley and contains 6,006 statute acres. It was purchased from the family of Worsley in the time of Queen Elizabeth.

The third Duke of Bridgewater (of canal fame) purchased mineral estates adjoining the ancestral area, between the years 1749 and 1803, amounting to 6,869 statute acres, for the purpose of extending and developing his colliery workings from the underground canals, which ultimately reached a length of 40 miles.

The third Duke built, between the years 1759 and 1786, the Bridgewater Canal, 40 miles long, at considerable expense and at a uniform level—crossing the River Irwell (now the Manchester Ship Canal) by the famous aqueduct at Barton, near Manchester. To complete this canal the Duke borrowed money from his farm and other tenants at interest. It is reported that for some time he lived at the rate of £400 a year. The canals connected at the same level his collieries, right from the working coal face to Manchester and to Liverpool, reducing the price of coal at these towns by one-half, and so paving the way to the commercial prosperity of both towns."

Witness: May I make a correction there?

Chairman: Yes.

Witness: It is at a uniform level to Liverpool. It ought to be to Runcorn. We "lock down" from the Bridgewater Canal to the River Mersey at Runcorn, about 16 miles on the Manchester side of Liverpool.

Secretary: "From the year 1803 to 1903 the trustees of the Third Duke of Bridgewater purchased 2,149 statute acres of additional mineral property (nearly the whole area being in the Worsley district) in order to further develop the collieries. As the seams to the rise of the canal were worked out, it was necessary to sink and equip shafts from the surface to work coal at greater depths than the canals, and this was done.

The Third Duke's successor—the First Earl of Ellesmere (Lord Francis Egerton)—withdrew women from the pits many years before there was any legislation on the subject, and opened schools for their instruction and the instruction of others in various ways, and also made them temporary monetary allowances until they could earn a living. No women have been employed at the collieries since. He also built schools, dispensaries, and institutes on the estates.

The Third Earl of Ellesmere purchased 1,568 statute acres of mineral property in the Worsley area, inside

Chairman: No, the other way round.

17,206. Sir Leo Chiozza Money: The Death Duties were included in the 11s. 6d.—I meant only to deduct the amount of taxation. I did not question the three-quarters. I only intended the amount of taxation should be deducted from the royalties.

17,207. Chairman: Are there workings underneath the spot where these houses are being built?—Yes.

17,208. Is there a right of support to the houses?—No, they take the risk. I might explain in this case there are over 400 yards vertically between the seam and the surface. It is very flat ground at the top of the hill, and I do not think there will be any serious damage there from subsidence.

and adjoining his estate, for the further improvement and development of the collieries.

The present (Fourth) Earl of Ellesmere has completed a scheme, which he often discussed with his late father, by purchasing an area of surface adjoining the Manchester Ship Canal, to connect his collieries in a more direct line with that important waterway, but the building of this railway and other important developments are held over for the present.

The Earl of Ellesmere's royalties and wayleaves from tenants during the last seven years have averaged £26,709 per annum, and from his workings £16,788 per annum.

From these must now be deducted—

	s.	d.
Mineral Rights Duty	at	1 0
Income Tax	"	6 0
Super Tax	"	4 6
Total Deduction	11	6

Leaving 8s. 6d. in the £ from which a further deduction must be made for the cost of surveying and supervising the working of the mines collecting the rents and legal expenses.

During the war, Lord Ellesmere contributed to the maintenance of the wives and children of his workmen in the Army. Some of the contributions still continue.

The output from the Bridgewater Collieries has been:—

Year.	Tons.
1845	289,103
1912	1,058,829
1913	1,196,288
1914	1,182,368
1915	1,226,139
1916	1,315,199
1917	1,396,222
1918	1,323,653

The following being the amounts expended on development from 1759 to the end of 1918, which have under the Earl's instructions been furnished for the information of the Commission:—

	£	s.	d.
By the Duke of Bridgewater, 1759/86	346,805	18	3
" Marquis of Stafford...	184,838	3	1
" First Earl of Ellesmere ...	426,202	17	6
" Second Earl of Ellesmere ...	248,055	4	0
" Third Earl of Ellesmere ...	2,311,025	2	7
" Fourth Earl of Ellesmere ...	66,162	12	7
	£3,583,089	18	0

We have extracted the foregoing figures amounting to three million five hundred and eighty three thousand and eighty-nine pounds, eighteen shillings, from a general statement of the Duke of Bridgewater's expenditure covering the years 1759 to 1786 from the Bridgewater Trust Release and Indemnity Statement covering the years 1803 to 1902 and from the annual statements of account for the years 1903 to 1918.

(Sgd.) JOSOLYNE MILES PAGE & CO.,
Chartered Accountants,
Manchester and London.

Witness: I have the original Certificate.

13 May, 1919.]

MR. JESSE WALLWORK.

[Continued.]

Chairman: If we want it we will ask you for it.

17,209. *Mr. Herbert Smith*: How long have you been at this Company?—I served my time there, but I have been away at other collieries as manager for a period of 10 years between 1893 and 1903, and with that exception I have been there all my life.

17,210. Do I understand from you that you have withdrawn all women labour from the pit top and below?—I speak only for the Bridgewater Collieries; I do not speak for Lancashire.

17,211. In Lancashire you know a large number of women are employed?—Yes, and very well they work.

17,212. Do you agree they should be working there?—For the work they do, yes.

17,213. Would you like to see your daughter there?—She is otherwise engaged. She has a family of little children to look after.

17,214. Would you like to see your daughter working there?—If she took to the job.

17,215. Have you tried it?—At the collieries at which I am interested we have not had them. She has not been at other collieries, except those where she has been about with me.

17,216. They are employed because they are cheaper than men?—I am not sure they are for the labour they give in return for the wages they receive; I doubt it.

17,217. You know in Yorkshire we would not allow it?—I did not know that. I have not got quite into all your Yorkshire ways.

17,218. With regard to the paragraph about Lord Ellesmere contributing to the wives and children and of workmen, would it not be better to contribute to their fighting in England than fighting in France?—Lord Ellesmere was in charge of the 3rd Battalion of the Royal Scots from 1912 until last year.

17,219. Would he not be better engaged than doing that?—He was open to do both. He was at the service of the country during the whole of that period. He was in command of the 3rd Battalion of the Royal Scots, and if it had been necessary for him to go out he would have gone. He made arrangements to do so.

17,220. He had something to go out to defend?—We all had the honour of our country; my own boys went; some have come back, some have not.

17,221. My boys went. Lord Ellesmere had something to defend, a part of his country?—Part of ours, too.

17,222. I submit to you that a lot of these Lan-

cashire miners had no country at all, only an existence?—May I answer you in my own way? That is the difference between our county and theirs? A good many of our colliers own their own houses, in which cases they are members of the Co-operative Society. The Society advances money at a cheap rate of interest and they are tenants of their own houses.

17,223. We say there are not many in proportion in our district?—I will give it if it is necessary for the Commission to have it.

17,224. There are very few?—There are some; I do not know the number.

17,225. Will you admit there are a large number of bad houses in Lancashire?—Not in our part.

17,226. Will you admit in Lancashire there are some very bad houses in the mining villages and towns?—Of course, I suppose there are houses that are not very good. I do not think they are kept by colliers.

17,227. I suppose there are some colliers' houses which you know well and there are a large number at Wigan which are not very nice houses for miners to live in very happily?—I do not know Wigan very well. I have not inspected miners' houses there. I know our own district and they are particularly good.

17,228. Are we to take it that you have come to speak about your own particular district and not Lancashire generally. Are we to take that?—Yes. I accept that.

17,229. *Mr. R. W. Cooper*: When did the present Lord Ellesmere succeed to the title?—On the 13th July, 1914.

17,230. I do not know whether you are familiar with the history of the Bridgewater property, but you probably know it as a matter of national history?—I think my *précis* states that.

17,231. It is recorded in the standard historical works of this country?—Yes.

17,232. Am I right that the first Duke was an engineer?—The third Duke.

17,233. If we want further information we should look at the Lives of the Engineers, Lecky's History of England in the 18th Century, and the Greville Memoirs, and we shall find all about the Earls of Ellesmere and the Dukes of Bridgewater?—That is so.

17,234. *Mr. Robert Smillie*: Is not that the gentleman that had the clock arranged so that it struck 13?—The Duke did. You saw it when you were there.

(The Witness withdrew.)

Chairman: I was going to call witnesses from the Kent Concessions, but they have gone. I will call Mr. John Dewrance on behalf of the Boring Com-

panies, and there is one other brief witness, and that will conclude to-day's proceedings.

MR. JOHN DEWRANCE, Sworn and Examined.

Chairman:

"(I) Parties represented.

Witness is Chairman of certain Pioneer Companies who have proved coal in Kent. He has been deputed to represent a number of the Boring Companies and persons who have carried out boring development and other pioneer work in South Yorkshire, North Notts and Kent, during the last fourteen years. A list of these is set out in Appendix A. The three districts in question are those in which the greatest areas of concealed coal have been proved, but much other work has been done in Somerset, Staffordshire, Warwickshire, Shropshire, North Wales, and other districts with which Witness is not in touch, as there is no association or organisation of Boring and Pioneer Companies."

Appendix A is as follows. It gives the names of the Boring Companies in South Yorks, North Notts and Kent for whom the Witness is appearing.

South Yorks—

Thorne Coal Bore Syndicate, Limited.
Yorkshire Boring Company, Limited.
Rawcliffe Boring Company, Limited.
Pollington Boring Company, Limited.
Wressle Boring Company, Limited.

Kent—

Canterbury Drillers, Limited.
Whitstable and Canterbury Coalfields, Limited.
Beteshanger Boring Company, Limited.

Heminghrough Boring Company, Limited.
Howden Boring Company, Limited.
Drax Options Syndicate, Limited.
Lord Londeshorough (Selhy and Barlow Bore)
Lord Fitzwilliam (Armthorpe Bore).
Sir Arthur Markham's Executors.
Captain A. Farquhar, on behalf of
Wallingwells Boring Company, Limited.
Messrs. J. & T. Mitchell.
Mr. Mammatt and former Members of the
Normanby Coal Syndicate, Limited.
Mr. Archibald Grove and others associated
with him.

North Notts—

The Bunterley Company, Limited.
The Retford Coal Syndicate, Limited.
The Coal and Iron Development Syndicate,
Limited.
The Stanton Coal and Iron Company,
Limited.

13 May, 1919.]

MR. JOHN DEWRANCE.

[Continued.]

- Ebbfleet Coal Syndicate, Limited.
- Channel Stool Company, Limited.
- The East Kent Colliery Company, Limited (Tilmanstone Colliery).
- Kent Coal Concessions, Limited.
- South Eastern Coalfield Extension, Limited.
- Extended Extension, Limited.
- Deal and Walner Coalfield, Limited.
- Messrs. Dorman, Long & Co., Limited.
- Messrs. Bolckow, Vaughan & Co., Limited.
- The Snowdon Colliery, Limited.
- The Chislet Colliery, Limited.
- North Kent Coalfield, Limited.
- Messrs. Schneider et Cie.
- The Forges de Chatillon, Commentry & Neuves Maisons."

"The Allied Companies" Committee.

Mr. Dowrance will go on to read his own proof which goes to this, the way in which coal is hored for, that is to say borings put down in order to test and see if there is any coal beneath the surface.

Witness :

(2) Three classes of coalfields.

Coalfields generally may be divided into three categories:—

- (a) Those which have been proved on the basis of original development from the outcrop.
- (b) Those adjoining known coalfields but partly covered by an unconformable capping of later rocks under which the continuation and character of the coalfield as regards depths, thickness and quality of seams and faults has had to be proved by boring.
- (c) Those adjoining no known coalfields but completely hidden by an unconformable capping of later rocks which have had to be proved by boring and subsequent sinking.

The following are illustrated cases:—

- (a) South Wales Coalfield.
- (b) The hidden portion of the South Yorkshire and North Nottinghamshire Coalfield.
- (c) The Kent Coalfield.

(3) Resultant Modes of Colliery Evolution.

Colliery evolution has accordingly varied in character in the three classes of coalfields:—

In (a) the coal was originally worked on a small scale where it outcropped. From the information thus obtained the more promising seams of coal were worked at increasing depths until ultimately shafts were sunk to develop large underground areas. Under this heading the pioneer risks and expenditure were comparatively small.

In (b) some evidence as to character and quality of seams may be found from the working of an adjoining coalfield of category (a), but a heavy expense is involved in ascertaining definitely whether the known conditions continue in the hidden portion of the coalfield, and if not, the precise extent, nature and situation of the modifications, information which is vital for subsequent development.

In (c) no evidence at all is available from outcrop or other workings. The Kent coal measures at no point are found nearer than 800 feet from the surface and on the average 1100 feet. Consequently, the expenditure, risk and difficulty involved in providing the existence of a workable coal area is still more accentuated than in (b).

(4) Description of Pioneer Procedure.

Pioneer procedure is generally as follows:—

A company, or individual, on the basis of skilled geological investigation infers the existence in a certain area of workable coal. On the strength of this probability, options or leases are acquired covering an area of minerals adequate in size to allow of the development of one or more collieries in the event of workable coal being proved. The options or leases are arranged with a preliminary period at a nominal or no rent within which one or more boreholes to prove the area can be put down.

Should the boring prove successful, and the development of the coal be considered commercially practicable,

the company, or individual, having completed the preliminary pioneer work either (1) disposes of the colliery area or areas proved to an entirely independent colliery company which, so far as may be necessary, completes the pioneering work commenced by the boring company and establishes by sinking and proving by underground workings the economic value of the coal proved, or (2) proceeds itself with the development and establishment of a colliery.

The result of a boring or borings may show that additional land should have been taken up originally in order to secure the fruits of the enterprise. Steps are then taken to do this either by the original company itself or jointly with others or by some of its members.

When the company or individual disposes of an area to the colliery company the consideration takes a variety of forms. Where one or more boreholes have been put down the colliery company usually repays the actual amount expended on the areas including the cost of the boring, and agrees to make a deferred payment, which varies according to the circumstances, of a small sum per ton on the output as and when obtained. Where the area disposed of to the colliery company has been proved by boring on a neighbouring area the colliery company usually makes a payment to cover the cost of taking up the leases, agreements etc., with possibly some small cash payment towards the cost of boring or general expenditure and a similar deferred payment as in the preceding cases. Where a new colliery company has been formed, payment instead of being deferred, is usually in the form of fully-paid shares to a fair amount according to circumstances. In the case of Kent a lump sum payment at so much per acre has been negotiated in certain cases.

The pioneers as a rule have fallen under three heads, namely:—

- (1) Proprietors of minerals.
- (2) Companies formed specifically for the purpose of acquiring areas and proving coal.
- (3) Mine owners, i.e., colliery companies who have acquired an area which whilst it is believed to contain coal requires proving to establish its economic value.

The pioneer work carried out up to the present in the fields to which this evidence refers is illustrated by the following figures:—

South Yorkshire—Total feet hored ...	45,269	in 18	hores.
North Notts—Total feet hored ...	36,608	in 18	hores.
Kent	90,000	in 40	hores.
Total	171,877 ft.,	76	hores.

In a completely hidden field the pioneer work does not stop at the boring. Knowledge has to be obtained by sinking and workings of the conditions of the coal seams proved by the boring. The total amount of sinking in Kent under this heading is 19,000 feet.

The total amount spent in getting together areas, boring, and expenses incidental thereto in pioneer work, so far as can be ascertained, is as follows:—

In the hidden portion of the South Yorkshire Field:—	
In respect of 13 boreholes and the relative areas	£137,100
Estimate in respect of 5 boreholes put down by colliery companies, apart from cost of acquisition of areas, or overhead charges ...	30,000
	£167,100
In North Notts:—	
The figures are not received, but should average for boring, cost of acquisition, and overhead charges, about £10,000 per bore, but deduct £10,000 for possible error, say for 18 hores ...	£170,000
And in Kent, including sinking and equipment	£3,552,337
	£3,889,437

13 May, 1919.]

MR. JOHN DEWRANCE.

[Continued.]

(5) *Results of pioneer work.*

The results of the work described above for the expenditure given are as follows:—

In South Yorkshire a hidden coalfield of 300 square miles, of which no definite information was previously available, has been proved to exist. It is equal to about forty per cent. of the proved Yorkshire Coalfield in 1905. A considerable proportion of the field so discovered is actually producing at the present moment and the whole of it is of prime economic importance. This field is estimated to contain 1,672,800,000 tons in the Barnsley seam alone. The Shafton and Dunsil seam exists over a large part of the area, apart from various other seams above the Barnsley in portions of the area.

In North Notts 100 square miles of hidden coalfield was also discovered, of which 34½ square miles are estimated to contain 196,600,000 tons.

In Kent coal measures have been proved of about 250 square miles. Of this area 105 square miles are estimated to contain 1,371,600,000 tons in seams of three feet thick and over within 3,000 feet from the surface.

At the time of the Coal Commission in 1905 none of these reserves of coal in South Yorkshire and Notts had proved, as is shown by the Appendices to the Report of the Royal Commission and the plan attached thereto, and with regard to Kent special reference is made by the Commission to the fact that the data available were as then insufficient to enable an opinion to be formed as to whether any reserves of workable coal existed or not.

So far as South Yorkshire and North Notts are concerned the situation in 1905 and in 1913 are clearly shown in the Memoir by Dr. Gibson referred to in the note. Further work has been done since 1913.

(6) *The risk undertaken and the enterprise demanded.*

Of the 18 bores put down in South Yorkshire 10 can be regarded as successful, 4 doubtful, and 4 negative in their results.

Of the 18 bores put down in North Notts 6 can be regarded as successful, 6 doubtful, 4 negative in their results, and 2 are in progress.

Of the 40 boreholes put down in Kent 7 proved to be outside the coalfield, 16 were successful, and of the remainder 13, although they proved coal, proved seams of secondary importance under present-day conditions, while 4 did not reach the coal measures.

The boreholes which gave negative results represent large sums of unproductive expenditure.

Even after payable coal has been proved the pioneer frequently has to wait a considerable period before a colliery company is forthcoming to undertake the sinking and to establish a colliery. In the meantime where minimum rents are payable the pioneer company has to bear these, also the cost of administration, the maintenance of its options, and leases, and the loss of interest on capital, which in every case extends over a considerable period of years, and in the event of failure a total loss of capital.

(7) *General.*

"Nationalisation" in any of the three forms suggested, viz. :—

- State ownership with (a) State working ; or
(b) Private working ; or
(c) Working controlled by miners

is incompatible with efficient and effective pioneer work. Nationalisation in any sense is only practicable in the case of a mature industry of a monopoly character, and then only at the cost of economy, efficiency, enterprise and initiative. Pioneer work is the very opposite of a mature industry. It is of an exploratory and intensely speculative character. Its success, in the present state of development of the coal industry, wholly and fundamentally depends on the special knowledge and courage of the adventurers, their readiness to risk always, and frequently to lose capital and face vicissitudes, often in the face of discouragement and scepticism from experts in the industry.

NOTE—Dr. Walcot Gibson of the Geological Survey in his Memoir on the Concealed Coalfield of Yorkshire and Nottinghamshire published by the Government, estimates the area so proved in South Yorks and Notts at 1,200 square miles.

This no doubt applies to proof in the geological sense. The areas of 300 square miles and 100 square miles in the text are proved from the colliery point of view.

Dr. Gibson shows 9 feet of Barnsley Seam (see p. 65) but takes feet and 1,200 tons per foot per acre.

In any event experience shows that bureaucracy does not conduce to inventive or pioneer enterprise.

If, however, nationalisation or control of the Coal industry is effected, then inasmuch as workable coal of great national importance has been proved, entirely as a result of enterprise, initiative, and capital expenditure, on the part of private persons who have assumed the whole risks of a speculative undertaking, it is contended that they should be adequately compensated and remunerated.

The following statements were referred to:—

A.—List of pioneer companies and persons represented by this witness (see list at beginning of witness's evidence).

B.—Reprint of a paper on the search for new Coalfields in England read before the Royal Institution on the 17th March, 1916, by Sir Aubrey Strahan, the Director of the Geological Survey (not printed herewith).

C.—Details with respect to South Yorkshire and North Notts with plans showing the developments in South Yorkshire and North Notts respectively (vide Evidence by Mr. H. Eustace Milton, p. 740, and Statement with map by Mr. Arthur Woolley-Hart, Appendix), and a Memoir on the Concealed Coalfield in Yorkshire and Nottinghamshire by Dr. Walcot Gibson, of the Geological Survey (not printed herewith).

D.—Evidence on Geological and Mining Conditions and the general position in Kent, by Mr. E. O. Forster Brown, with plan of the Coalfield (vide Evidence by Mr. Edward Otto Foster Brown, p. 736).

17,235. Mr. Herbert Smith: May I take it that according to your evidence on page 6 any private enterprise which took this risk ought to be compensated?—Yes.

17,236. Will you tell me when this boring company started in South Yorkshire and started boring to prove this hidden coalfield?—The date is given in the appendix.

17,237. Am I right in saying it has all been done since 1900?—I think you are.

17,238. I want to submit to you there was not a hidden coalfield in South Yorkshire. You know where the Cadeby Main Colliery is?—Yes.

17,239. You know where the South Carr Colliery is?—I do not know.

17,240. George Dunstan put down a boring there. You know Thorne? How many miles is Thorne from South Carr?—I am not familiar with those. There is a gentleman here who can tell you if you want details.

17,241. The company you represent, you say, is the Pioneer Company?—Yes.

17,242. The point I make is this, that this coalfield was proved before you went near it?—The coalfield was not proved when the Thorne boring was put down.

17,243. Six miles from South Carr is Thorne and six miles from Cadeby. Barnsley was found in 1893 by George Dunstan. Do you know him?—No.

17,244. It is rather amusing to get in your *précis* with regard to Mr. Gibson. His statement was made in 1905. If you read the statement George Dunstan made in 1906. The figures are about similar. He told us in that coal area in 1893 there was practically 71,189,000 odd tons. That was in 1896. That was later on proved by this gentleman in 1905. It proves you are not the pioneer?—These bores have been put down since that date.

17,245. All in this area except that of J. & T. Mitchell and that at Pollingdon and that at Selby. They are practically all in this area I am speaking of. Am I right in saying this company works on a scale of payment?—The Pioneer Company?

17,246. Yes. Does it work at something like this? There is 25l. per foot per acre when worked?—That I could not say.

17,247. And that they take 17l. 10s. and you take 7l. 10s. off the colliery owner when he starts to work that—a different payment?—Mr. Mitten is here and he could answer that question better than I could.

17,248. You know there are some such arrangements?—Yes.

17,249. Would you alter your opinion as to the hidden coalfield in Yorkshire when I tell you the majority of your boring holes are inside that 14 miles? I think if you look with regard to the Markham area they are all in that area?—If it had not been for the Thorne boring none of this area would have been taken up at all I am told.

13 May, 1919.]

MR. JOHN DEWRANCE.

[Continued.]

17,250. Is Pease and Partners Thorne boring?—On this property, yes.

17,251. Am I right in saying that boring was done since 1903?—I think so.

17,252. Six miles away there was a bore hole put in 1893, 20 years ago?—It did not prove sufficient to have the area taken up.

17,253. They proved at Barnsley Bed and Dunstant Bed. You have done borings there?—At the time the Thorne boring was put down it was stated by geologists that the enthusiasm of the borers exceeded their geological knowledge. They were not expecting to find the Barnsley seam there.

17,254. What I put to you again is this. If there was a bore hole put down in 1893 within six miles of Thorne—I would rather you put that question to the expert. I am not an expert.

17,255. You should not come to give evidence you cannot carry out. You put in your proof a hidden coal-field. You prove that and I put to you you have not?—I base my evidence upon these appendices which give the names of the gentlemen who can speak to them.

17,256. You cannot answer my question?—No, I cannot.

Then I will save it for the next witness.

17,257. *Mr. Robert Smillie*: Have you any practical knowledge of mining at all?—No.

17,258. You are connected with the Kent collieries?—Not the collieries; with the parent companies.

17,259. You are a director, are you not?—Chairman.

17,260. You are the Chairman of Directors?—Yes.

17,261–62. You have a dual position. You are connected with the pioneer boring company as well?—Those are the pioneer companies; the parent companies.

17,263. Is it the pioneer company that is the owner of the Kent Concession?—The Kent Concession is the pioneer company.

17,264. Is that the company that has bored all over Yorkshire and Nottingham?—No.

17,265. Are you connected with the people who bored over Yorkshire and Nottingham?—I am representing them.

17,266. You are representing the mineral royalty owners here just now, and giving evidence in their favour?—No, the pioneer company.

17,267. The pioneer company is the royalty owners?—Not necessarily.

17,268. You are giving evidence on behalf of the royalty owners?—No, I am giving evidence on behalf of pioneer companies. We can divide it up into five different positions; the mineral proprietors; the pioneer companies; the mine owners; the distributors and the consumers. I want to bring forward the importance of the work done by the pioneer companies.

17,269. It is amazingly difficult to find out who you are representing here. Do you represent the owners of the mineral royalties in Kent?—No, I represent the pioneer companies throughout the Kingdom.

17,270. What are the pioneer companies?—The companies who discover a new coalfield and bore in it and prove it and then either get it developed by the colliery owner or develop it themselves.

17,271. A company that discovers new coal fields and bores them?—Yes.

17,272. The pioneer company is the company that goes up and down the country boring for coal?—Not necessarily boring only for coal. Take for instance Kent. At the time Kent was first supposed it might have coal it was necessary to get capital to prove there was coal in Kent, and the Kent Colliery Pioneer Companies had expended this large sum of money and proved this enormous reserve of coal for the nation.

17,273. We want to know exactly what your position is. You do not represent the owners of the royalty?—No.

17,274. Are you representing here the mine owners who are working the royalties?—No.

17,275. You do not know. Then you represent a third party that is not here and has not been heard of at the present time. You represent people who have holed for coal and discovered it?—Not exactly that; they have provided the capital that has been necessary to develop and exploit the field ready for mine owners to come along and put down mines and raise the coal.

17,276. Do you mean sinking?—No, only partly.

17,277. Is it possible to know exactly who you are representing here? You said you did not represent the mine owners?—No.

17,278. And you did not represent the mineral owners?—In between the mine owners and the mineral owners are these pioneer companies, and I want the Commission to recognise the great importance of these pioneer companies and the work they have done throughout the kingdom.

17,279. Did the pioneer company require to get the consent of the owners of the land before doing any boring?—Yes, certainly.

17,280. Did they require to sign a lease of any kind before they got the consent to bore?—Yes.

17,281. Did they require to pay a dead rent for the minerals, if any, under the lease?—It is a matter for arrangement, but it is so generally.

17,282. What did the borers pay in Kent to get the right to bore?—In Kent they entered into leases with stipulations that they can transfer them to colliery companies when they have proved the field sufficiently for the colliery owners to be attracted.

17,283. Supposing you bored in Kent and you found the coal all right but you could not raise the money to sink pits for the coal, would you still be required to go on paying a dead rent?—Yes.

17,284. For what period?—Some of them have periods at which you can discontinue, but not all of them.

17,285. How much per acre?—Up to £2 per acre.

17,286. What extent of field?—For 60,000 acres.

17,287. You require to pay that, although no development in the shape of sinking has taken place?—It has taken place.

17,288. I am putting to you that it might not have taken place, and you pay for the lease, and the pioneer boring company would have to pay £2 an acre for 60,000 acres?—Ultimately.

17,289. For a long period?—Yes.

17,290. That would be £120,000 a year?—Yes.

17,291. Without getting anything out of it. Now the pioneer company's business as soon as they say they have discovered coal which has previously been discovered want to form a company to sink the pits and exploit the coal. Is it not the desire to have the coal exploited?—Certainly.

17,292. And they endeavour to get either existing colliery companies or new colliery companies to put up the money for sinking the pit?—That is so.

17,293. If they fail to do that they must go on and pay a dead rent?—Yes.

17,294. How many owners are there included in this 60,000 acres in Kent?—Several hundreds.

17,295. Is Plumtree one?—Yes, there are two owners of the name of Plumtree.

17,296. Are the lands of both of them within the Kent Coal Concession?—Not entirely. Some is the south eastern extension.

17,297. Are there 400 acres belonging to one of the Plumtrees that is not to be touched—it is not to be exploited, not taken out. Is that so—400 acres right in the centre of his park?—There is some reservation on behalf of the Margate Waterworks, I believe. I did not know it was 400 acres.

17,298. Is the pleasure park of one of the Plumtrees 400 acres reserved in the lease?—I think it is the Margate Waterworks area that is reserved.

17,299. Do you know whether or not the park near the house, or 400 acres of it, is reserved?—I think that is part of the area that I speak of—the Margate Waterworks.

17,300. I am not speaking of the Margate Waterworks. I am speaking of the park.—The Margate Waterworks may happen to be a park.

17,301. Is it a condition of this lease that there is not to be any sinking within three miles of the mansion house?—I do not think so. You have the lease there, but I do not think that is so.

Chairman: I did not understand that this gentleman was a director of the Kent Coal Concession. If you will give me the lease I will look into it and I will ask some questions about it.

17,302. *Mr. R. W. Cooper*: I should like to ask a question or two. Let me understand, in the first place, have you personally negotiated this arrangement with the landowners?—No.

17,303. Then you personally have no knowledge of the matters of which you have been speaking, or very little?—No.

13 May, 1919.]

MR. JOHN DEWRANCE.

[Continued.]

17,304. Who are the persons who have conducted the negotiations who can give us the first hand information?—The solicitors to the company can give you the best information.

17,305. I see in your appendices Mr. Otto Foster Brown is mentioned—has he personal knowledge?—He has personal knowledge, of which he speaks. He has been negotiating for the Schneiders.

17,306. In your *précis* you have attached three or four appendices consisting of evidence that can be given by witnesses; one is Mr. Otto Brown, another Captain Farquhar, and Mr. Henry Eustace Mitton of Derbyshire. Do they know the facts with regard to these negotiations?—No, we did not know at the time we prepared that evidence that we should be required to go into the question of the leases.

17,307. When you begin, do you begin by getting an option from the land owners?—I did not begin. I only took it over in 1914.

17,308. Whoever began, did he begin by getting an option from the land owners?—Yes.

17,309. Is that in the form of an agreement by which the land owner gives liberty to bore for a certain limit of time, and then the agreement provides that within a certain limited time the speculator has the option of taking a lease?—That is usually the case.

17,310. The terms of the lease are set forth in this option agreement?—Yes.

17,311. Is not the speculator a sort of prospecting syndicate?—Yes.

17,312. What you have been calling a pioneer company is what I would call a prospecting syndicate. I do not know what your leases may be in Kent, but in the leases which the speculator or the prospecting syndicate has the option of taking up, is it not the case that no dead rent is payable or that a very small dead rent is payable for the first few years of the term of the proposed lease?

17,313. *Chairman*: I think we had better have the leases?—The dead rent is progressive.

Mr. R. W. Cooper: The point is that the lease does not come into effect till the option is exercised. The boring is not carried on under the lease but under the option agreement.

Chairman: I quite agree that, but what Mr. Smillie was on was the lease.

Sir L. Chiozza Money: Is this gentleman supposed to give evidence on both sides?

17,314. *Chairman*: What Mr. Smillie got from him was that he was Chairman of the Kent Coal Concessions, Limited. That is right, is it not?—Yes.

17,315. Now I have here the lease granted by these landlords to the Kent Coal Concessions, and we will be able to get at once what Mr. Smillie wants. It is: This indenture made the 21st day of November, 1907, between Mr. Plumtree of the first part and the Rev. Mr. Plumtree and another Mr. Plumtree of the second part and The Kent Coal Concessions, Limited, of the third part—that is you?—Yes.

17,316. It is a very long lease. It witnesses: In consideration of the rents and royalties the reversioner grants to the lessees all the mines, veins and seams of coal described in the schedule, amounting to 2,323 acres, with liberty to work and to carry away the demised minerals. Now we will see what you have to pay—To hold the premises hereby granted and demised with the appurtenances unto the lessees from the 1st January and thenceforth for the term of 60 years, yielding and paying the following dead rents: the first year £400, for the second year £400, for the third year £700, and thereafter during the said term a yearly rate of £3,000. Is that right? Do you remember the terms of your own lease?—I did not negotiate the lease.

(The Witness withdrew.)

MR. JAMES EDMOND, Sworn and Examined.

17,333. *Chairman*: I think you are the factor on the estate of the trustees of the late R. G. E. Wemyss?—Yes.

Chairman: We read the evidence when the Earl of Strafford was in the box, but he was unable to tell us anything. I will ask Mr. Smillie to ask you any questions he desires.

17,334. *Mr. Robert Smillie*: Were these minerals, or the ground under which the minerals are, held by charter?—The root title is a Crown charter,* and the estate was bought by Col. William Erskine from the Earls of Kincardine in 1689.

17,317. Provided that in respect of the said dead rents the lessees may work such quantities of the mined minerals as with the royalties next hereinafter mentioned will be equal to the said dead rents. Then there is a short working clause. Then: yielding and paying the following royalties, for all coal, whether large or small, worked in the described lands, the royalty of £35 for every statute acre of 1 ft. in thickness, for all Cannel Coal worked in the described lands for every statute acre 1 ft. in thickness in the proportions following: where the coal is less than 12 ins., £50, over 12 ins. and less than 24 ins., £70, over 24 ins., £95; for all ironstone worked a royalty of 6d. per ton of 2,240 lbs. Then there are a lot of other royalties. Have you paid that £3,000 a year for the last five or six years?—We have not paid it since the outbreak of war.

17,318. You were paying it before the war. You see this lease is 1907?—Yes.

17,319. The fourth year—that is 1911—you had to pay £3,000 a year?—Yes.

17,320. Were you getting coal up?—No.

17,321. You were paying £3,000 a year for this and getting no coal?—Yes.

17,322. That is Mr. Smillie's point?—That is quite correct.

17,323. It is about 25s. the surface acre. After the war were you let off paying it?—That has not been settled yet.

17,324. I do not know about these things, but Mr. Smillie's point is this—I am not saying it is a good point and I am not saying it is a bad point—but what he is suggesting is that the landlord is getting a very large sum out of you although you at the present moment have not got any coal out of it?—Subject to the finding of this Commission, we have an agreement with Messrs. Schneider which will make it worth while having done that.

17,325. *Mr. R. W. Cooper*: Is it Messrs. Schneider of Creuzot?—Yes.

17,326. *Chairman*: Mr. Smillie's point is, are you paying to these landlords this sum of £3,000 although as a matter of fact you have not got to the coal?—We were up to the outbreak of war.

17,327. *Mr. Robert Smillie*: Are you paying a dead rent on that 400 acres that is reserved that you can never touch?—Yes.

17,328. In the lease you have you can never take out the coal from under that 400 acres, but you are paying a dead rent for that coal that you can never take out?—Yes.

Chairman: What we will do is, we will hand these leases to Mr. Cooper, who is an expert in this sort of thing, and he may get rid of them to-night, and you can come again to-morrow morning.

Mr. Sidney Webb: May I ask one question?

Chairman: Certainly.

17,329. *Mr. Sidney Webb*: In one of the appendices you hand in, Mr. Mitton says, "In all the cases of the bores shown on the plan a full return has been given to the Government of the boring records." In the paper by the Director of Geological Survey he complains that he did not have these?—It was because he never asked for them. Directly he said that he received them. If he had asked for them before, he would have had them.

17,330. He said it was kept secret?—He never asked me for them.

17,331. *Mr. R. H. Tawney*: Does boring take place without notification being made to the Government, as a matter of course?—It is only by courtesy that we give it.

Chairman: I think we will ask you to come again to-morrow.

17,332. *Mr. R. W. Cooper*: If you have an option agreement, will you kindly bring it with you?—Yes.

17,335. Was the charter held by them handed over?—That was the first deed, the Crown charter.

17,336. Have you it?—No, I have an excerpt from it showing that the coal was conveyed by the Crown.

17,337. Coal is mentioned in it?—Yes.

17,338. *Chairman*: Will you read that bit?—The charter conveys the lands and mains of Torrie and the town and lands of Torryburn with the coal therein. There is a separate conveyance as a distinct subject of the coal within the seashore opposite the said lands of Torrie.

* See Appendix 80.

13 May, 1919.]

MR. JAMES EDMOND.

[Continued.]

17,339. *Mr. Robert Smillie*: Is there a stipulation in that charter that one ton of each 12 will be given to the Crown?—Not that I am aware of. I have not seen the charter.

17,340. That charter will have to be produced?—Whom will you cite? The titles are in the hands of the Scottish Widows' Fund Society, and our agents are Mackenzie & Black, W. S., Edinburgh.

17,341. I hope the Chairman of this Commission will ask for that charter to be put in, because it is rather important that it should be?—The Scottish Widows' Fund have it.

17,342. *Chairman*: I suppose the lands are mortgaged?—Yes.

17,343. Where is your draft of it?—I have no draft.

17,344. Where did you get that extract?—From a written statement by the late factor, Mr. Budge.

17,345. Is that the whole of the charter?—No, that is an extract.

17,346. *Mr. Robert Smillie*: I think you say the original charter under which the previous owner held is a Crown grant?—Yes, it must be a Crown charter because the title was made up by a precept from Chancery in favour of J. Erskine Wemyss.

17,347. Should the original charter, in a case of that kind, not change hands with the purchase of this taking of which the charter is granted?—Yes, it must be in the hands of the bondholders.

17,348. *Chairman*: Have you, in your mortgage, a covenant to produce documents?—Yes, for specific purposes.

17,349. Then you can get production of it?—Yes.

17,350. If you can get a copy, we do not want the original?—An extract from Chancery would contain all information.

17,351. In your mortgage deed you have no doubt a covenant to produce when necessary?—Yes.

17,352. *Mr. Smillie* does not want to put you to inconvenience. What we want is this particular information. Can you get a copy of it?—You can have an extract if necessary.

17,353. Of that particular part that *Mr. Smillie* wants?—Yes.

17,354. Is it a long charter?—I do not think it is very long.

17,355. They would probably charge you as much money for the extract as for the whole thing?—We could get an extract from the Office of Chancery.

17,356. I think you said you deposited that with the Scottish Widows' Fund?—That would be an extract. The principal deed may be with the Office of Chancery, because it is recorded there.

17,357. It is a precept from Chancery?—Yes.

17,358. I suppose we can have a look at it?—I can get a certified copy.

17,359. Very well, send that along to *Mr. McNair*?—Yes.

17,360. *Mr. Robert Smillie*: You say that was 1837 in one case and 1854 in the other?—These are two successions.

17,361. But the change took place in 1,600 something? It was bought by Colonel William Erskine, and it descended to Admiral James Erskine Wemyss, and then thereafter to his heirs.

17,362. I want to get at the original transaction. The person who got the grant sold it to Erskine?—Here is an extract I took from some old papers: "The lands of Torrie were held for centuries by the Wardlaw family."

17,363. *Sir Adam Nimmo*: Has the Crown ever made any demand on that coal which is referred to by *Mr. Smillie*?—No: we pay the Crown a feu duty of 29s. 4d. a year.

17,364. You have never been required to pay one ton in every twelve?—No.

(Adjourned to to-morrow morning at 11 o'clock.)

SECOND STAGE—TWELFTH DAY.

WEDNESDAY, 14TH MAY, 1919.

PRESENT:

THE HON. MR. JUSTICE SANKEY (*in the Chair*).

MR. ARTHUR BALFOUR.

MR. R. W. COOPER.

SIR ARTHUR DUCKHAM.

MR. FRANK HODGES.

SIR LEO CHIOZZA MONEY.

SIR ADAM NIMMO.

MR. ROBERT SMILLIE.

SIR ALLAN M. SMITH.

MR. HERBERT SMITH.

MR. R. H. TAWNEY.

MR. SIDNEY WEBB.

MR. EVAN WILLIAMS.

SIR RICHARD A. S. REDMAYNE (*Assessor*).

MR. ARNOLD D. McNAIR (*Secretary*).

MR. GILBERT STONE (*Assistant Secretary*).

MR. HENRY FITZWALTER PLUMPTRE and MR. DAVID NEVILLE TURNER, Sworn and Examined.

17,365. *Chairman*: (*To Mr. Plumptre*.) Do you live at Godneston?—I do.

17,366. I think you are one of the landlords of a certain tract of land in the Kent Coal Concessions?—Yes.

17,367. I believe that consists of 1,062 acres 2 rood 34 perches?—Yes.

17,368. I have a lease in my hand dated 8th May, 1907. Is that the first lease?—Yes.

17,369. *Chairman*: (*To Mr. Turner*.) What is your profession?—I am a mineral agent.

17,370. How long have you been the mineral agent to *Mr. Plumptre*?—Since 1913.

17,371. Are you familiar with the leases?—Yes.

Chairman: I have introduced both the witnesses to the members of the Commission. *Mr. Plumptre* is the landlord and *Mr. Turner* is the mineral agent. *Mr. Cooper* has been looking through the leases, and

14 May, 1919.]

MR. HENRY FITZWALTER PLUMPTRE AND MR. DAVID NEVILLE TURNER.

[Continued.]

I will ask Mr. Cooper to examine as to the contents of the leases. The better way will be for Mr. Plumptre to answer if he can, and if he cannot Mr. Turner, the mineral agent, will be good enough to assist him.

17,372. *Mr. R. W. Cooper:* (To Mr. Plumptre.) I have three leases before me, but in the third there is the name of Henry Western Plumptre. Are you the same gentleman?—No, I am not.

17,373. I have two leases from Henry Fitzwalter Plumptre, one dated 8th May, 1907, and the other 21st December, 1907?—Yes.

17,374. The third lease is only a small one of 294 acres. Dealing with the first lease, that is a lease of May, 1907, and it leases the coal and certain other minerals under an area of about 1,062 acres?—Yes.

17,375. The length of the lease appears to be 60 years?—Yes.

17,376. The dead rents appear to be £200 a year for the first year, £400 for the second year, and for every subsequent year £1,500 a year?—Yes.

17,377. The royalties appear to be for ordinary coal (that is, coal both large and small) £35 per foot thick per acre?—Yes.

17,378. Then for cannel coal, if the coal is less than 1 foot thick, it is £50 an acre; over 1 foot thick and under 2 feet thick, £70 an acre; over 2 feet thick, £95 an acre?—Yes.

17,379. Then there is a power given to the lessee to make up short workings throughout the term of the lease?—Yes.

17,380. But as regards any power on the part of the lessee to give up the lease, it appears to be as follows: That the lessees may give up the lease at any time during the first five years of the term on six months' notice, and at any subsequent half-yearly date on 12 months' notice, provided in either case it is proved or settled by arbitration that the lessees are unable to work except at a loss?—Yes, that is so.

17,381. That is the first lease. The land seems to be called Adisham. Is it a farm?—No, it is several farms. The land in that particular lease is land lying to the south-west of the Chatham and Dover Railway. That is why it was separate from the other.

17,382. Now I will come to the other lease, dated 21st December, 1907. That is a lease of coal and certain other minerals under 2,323 acres of land either forming part of or adjoining a place called Godnestone Park?—Yes.

17,383. The term of the lease is 60 years from 1st January, 1908?—Yes.

17,384. The dead rents are for the first year £400 a year; for the second year, £400 a year; for the third year, £700 a year; and for the rest of the term of the lease, £3,000 a year?—Yes.

17,385. The royalties are the same as in the other lease?—Yes.

Sir L. Chiozza Money: May I ask whether the £3,000 a year has come into operation yet?

Mr. R. W. Cooper: Yes.

Sir L. Chiozza Money: When?

Mr. R. W. Cooper: 1911. The term began on 1st January, 1908.

Chairman: Yes. The first three years are the other rents, and then comes the £3,000.

17,386. *Mr. R. W. Cooper:* Now that lease appears to contain certain special restrictions upon working. First of all, as regards any of the surface mining powers, the lessees are prohibited from occupying any land forming part of Godnestone Park, or any other land within a blue circle shown on the plan attached to the lease?—Yes.

17,387. Or any land forming part of the site of any dwelling-house or garden, and so forth, connected with the dwelling-house or the site of any church or clergyman's house?—Yes.

17,388. That is as regards surface restriction. With regard to underground restriction, you have prohibited any working within 440 yards of the mansion house or any building held therewith?—Yes, I believe that is so. I was not aware of it before, but my attention was called to it this morning.

17,389. Yes, it is in the lease. That is lateral, and there is a restriction as to any working vertically

within 200 yards of the surface under Godnestone House or Park?—Not the Park; the name of the house is Godnestone Park. I do not think it means all the park-land.

17,390. I am afraid it does. The words are that they shall not work any ground beneath the mansion house or any building held therewith, or the pleasure grounds or park within a distance of 200 yards from the surface?—Yes.

17,391. Then as regards the lessees' power of surrender, it is the same as in the other lease?—Yes.

17,392. That is to say, practically speaking, if the lessees can prove to the lessor's satisfaction or an arbitrator's that they cannot carry on except at a loss?—Yes.

Mr. R. W. Cooper: I think, Sir, those are the essential points.

Chairman: We are very much obliged to you, Mr. Cooper. Do you wish to ask any questions?

Mr. R. W. Cooper: No.

Mr. Robert Smillie (to Mr. Turner): Is there a dead rent chargeable upon the coal which is reserved?

Mr. Turner: The dead rent is chargeable over the whole area; it is not at so much an acre on the workable coal.

17,393. Is it £2 an acre?—No.

17,394. What is the dead rent charged on the reserved portion that the company is not allowed to work?—There will not be any dead rent on that.

17,395. Are you aware that we were told yesterday there was a dead rent on the reserved portion?—I was not here when that witness was giving evidence, but it is quite clear from the lease there is a specified dead rent of so much per annum on the area leased.

17,396. But with regard to the area leased, is that portion reserved not included in the area leased?—I suppose it is, but then it is taken out again. It is rather a curious way of wording it.

17,397. Let us get at that. I take it the whole field is leased—so many acres—which includes the whole coalfield?—Yes.

17,398. A part of that is deliberately reserved and cannot be touched?—Yes.

17,399. That is included in the lease and is a dead rent of so much per acre?—No; I think that is where we misunderstand each other. The dead rent is not so much per acre, it was fixed by bargain at the time the lease was drawn up.

17,400. In working the seams of coal under this lease there will be a considerable number of parts reserved on the property. Under the lease they are not to take out coal under certain properties—farms and so on?—At the time that lease was granted it was not known to the owner of the surface how the coal would be worked, and therefore that clause was put in, but I should advise Mr. Plumptre, now more is known about it, to have the coal worked out from under the house.

17,401. But, as the lease stands at present, that is the position?—As the lease stands at present there is the provision Mr. Cooper read about the 440 yards from the house.

17,402. (To Mr. Plumptre.) You are not a mining engineer, are you?—No, I am not.

17,403. You are guided by Mr. Turner?—Yes.

17,404. (To Mr. Turner.) You are a mining engineer, are you not?—Yes. I did not have anything to do with the drawing up of this lease, which is dated in 1907. I was only appointed in 1913.

17,405. You were not responsible for the drawing up of the lease?—No.

17,406. Do you know the difficulty in which you, or any other colliery manager, would be placed in working out coal if here and there part was to be reserved to keep up the surface?—Yes, it would be a difficulty.

17,407. (To Mr. Plumptre.) Will you tell me how you became possessed of this estate?—I inherited it, and my predecessors at various times in the last 200 years or so bought the estate. It was handed on to me practically in about the same area as it is now.

17,408. Do you remember who they bought it from?—Various people—a great number of persons.

17,409. Were there any trust deeds passed with the sale to your people?—Yes, I should think so.

14 May, 1919.] MR. HENRY FITZWALTER PLUMPTRE AND MR. DAVID NEVILLE TURNER.

[Continued.]

17,410. Forming the right to this property of the persons who sold it?—I believe so.

17,411. Did the deeds change hands?—Yes—I know I have a certain number of deeds.

17,412. Do you know whether the land was originally given by grant from the Crown?—No, I do not.

17,413. I suppose it was only recently that it became known there was coal under the surface of this estate?—Yes, only recently; it had been talked about years ago, and it was thought there was a possibility of coal in Kent when I was a boy, but it was only considered as a serious proposition recently.

17,414. It was thought there might be coal, but it had not been proved when you were a boy?—That is so.

17,415. Now will you tell us what efforts you made to prove whether there was coal on your estate?—I do not think I made any efforts.

17,416. You did not do anything at all to find out whether there was coal?—No.

17,417. Who did find out?—The Kent Coal Concessions and the Channel Tunnel people, who were the first to bore and find anything like coal. With regard to the Channel Tunnel Company, I forget what the title was in those days.

17,418. Do you remember what depth they bored to?—No.

17,419. Did they really prove by boring that there was coal under your estate?—No, they did not.

17,420. Was it after this lease was drawn up that boring commenced?

Mr. Turner: I think there had been borings prior to this lease—before 1907.

17,421. (To Mr. Turner.) By whom?—I think by the Concessions Company and the people on Shakespeare Cliff.

17,422. I am dealing now with Mr. Plumptre's estate for the moment.

Mr. Plumptre: I think there were borings a short time before the date of that lease—I do not know the exact date—within a short distance of my land. There was one within $1\frac{1}{2}$ miles and one was begun on my cousin's land by the Kent Coal Concessions. I think before the lease, within about 200 yards of my boundary.

17,423. There was no boring done on your estate until this lease?—No.

17,424. It is quite possible there may not have been any coal on your estate at all?—No, there may not have been.

17,425. And you did not take the trouble yourself to prove it?—I got them to give me the agreement to prove the coal before the lease was granted. There was an agreement that they should bore for coal and prove it to my satisfaction and theirs before I granted the lease. I am afraid I do not remember the dates, but I gave them an agreement to lease if the borings which I requested them to put down should prove satisfactory.

17,426. That would be an understanding, would it not?—No, it was a legal document.

17,427. Yes, but the boring did not begin until the lease was signed?—Yes, before the actual lease it did, but not before the agreement for the lease. I think that is the way to put it.

17,428. Did you yourself expend any money or promise to expend any money on the boring operations?—No.

17,429. We may take it that you allowed other people to spend their money to prove whether you were the possessor of coal in that land?—Yes. They rather came asking me to do it.

17,430. And you allowed them to do it?—Yes.

17,431. You allowed them to spend their money in proving that your estate was more valuable than you had any previous idea of?—Yes.

17,432. From the time boring started were you charging a dead rent to these people, or an annual rent to these people whom you had allowed to spend their money in trying to prove your property was valuable?—Yes; when the lease was signed they paid dead rent.

17,433. Not only were other people spending their money to prove your property was more valuable

than you thought, but you charged them for spending their money?—Yes.

17,434. Is that just and equitable?—Well, I believe it is a matter of business and was the best way of inducing them to work the coal.

17,435. Now let us put it in this way. You yourself did not spend money in proving this ground?—No.

17,436. But you allowed other people to spend their money in proving your property, and in the event of their not finding coal you had no risk to run. Is that not so? You ran no risk with regard to the loss of anything if they did not find coal?—Yes, that is so.

17,437. But they ran the risk of losing the money they were paying to you in order to prove your property was more valuable?—Yes, but it was their choice and not mine.

17,438. I put it to you again—Is that altogether just and equitable?—As between myself and them, I think it was.

17,439. What had you really done? In the first place, we may take it you did not put the coal there?—That is so.

17,440. Neither did you know it was there until somebody else came and you allowed them to bore and charged them a rent for doing so?—Yes.

17,441. Would I be right in saying with regard to the Kent Coal Concessions that there has been more money lost in the Kent Coal Concessions than has been gained?—I could not say that.

17,442. May I put it as high as this, that a large number of people put money into the Kent Coal Concessions and lost every penny of it. Are you aware of that?—No, I do not think so. The company is not wound up.

17,443. The company is not wound up, but a number of people who put money into it have been wound up long ago?—I do not follow.

17,444. People who put money into it in small sums have lost their money. You are aware, are you not, that at one time there was issued from London a prospectus dealing with the great advantage of putting money into the concern?—Yes.

17,445. Are you aware that a very large number of comparatively poor people were induced to put money into it?—No, I am not, and I never induced them. I have never asked anyone to put money into the Kent Coal Concessions.

17,446. No. You left it to someone else to do it, and they did it very effectively. You did not do it because it was not your concern. You were only paid to allow other people to do it?—I do not think so; I was selling my coal.

17,447. But you did not know there was any coal there at the time. You were getting money for it. How could you sell something that you did not know was there?—I do not know that I can be said quite to be selling coal. You see the coal is worked from under the land, and there would be a rebate with regard to what they have already paid me.

17,448. If they managed to secure a sufficiently high output there would be the two to make up, I suppose?—Yes.

17,449. Do you know whether or not the company has up to the present time paid a dividend?—I do not know. I do not think it has on the ordinary shares.

17,450. Do you know whether or not the directors are serving the company without any fees in order to endeavour to pull the company through?—I believe the present ones are; I have heard so.

17,451. And the reason for that is that there is going to be considerable difficulty in making the venture a success and they are serving without any reward in order to try and save the situation?—Yes.

17,452. Are you still charging them the dead rent?—No; I have had no dead rent since 1914.

17,453. Are you not getting this £3,000?—Oh no.

17,454. Not since 1914?—No.

17,455. Was that stipulated for in the lease?—No, the directors approached us soon after the war began and asked us to forego our minimum rents for the period of the war and six months afterwards and

14 May, 1919.] MR. HENRY FITZWALTER PLUMPTRE AND MR. DAVID NEVILLE TURNER.

[Continued.]

subject to some small conditions we have agreed to that and all the other owners have too.

17,456. Are they producing any coal at the present time?—Yes.

Mr. Turner: I would remind Mr. Plumptre that the agreement has not been carried out. Certain conditions Mr. Plumptre put in at the time were not accepted, but no rent has been paid.

17,457. (To Mr. Turner.) What were the conditions that were put in?—One was they were not to sink close to Godnestone House and the reason partly for that was that the managing director of the company at that time thought that 500 acres was enough for a colliery. I disagreed with him and thought it was a waste both of money and of valuable agricultural land and I suggested that his present pits at Wingham, Woodnesboro' and Snowdown were sufficient and there was no necessity to sink a new pit, and I think with that view the present management of the Company quite agree.

17,458. Was the stipulation that they were not to sink a pit within three miles?—No.

17,459. What was the distance?—There was a varying distance which just kept it out of sight of the house. It was quite a reasonable thing and the present directors of the Concessions Company quite agree with that.

17,460. You say as an engineer and adviser to Mr. Plumptre that it is quite a reasonable thing that Mr. Plumptre should draw his rents from coal which is being worked, but that the pits must be kept out of sight of the house?—No, not necessarily. You cannot take that as a general proposition. In this particular case with the pits which have been already commenced and have been already finished it was a very reasonable proposition and one which it was advisable for the Company to carry out too and for the sake of the country.

17,461. (To Mr. Plumptre.) I may take it you and gentlemen in your position do not like the sight of a coal pit anywhere near their house although they are prepared to take the money produced from it?—I do not mind that. I do not want my house or the rest of the village, who are all surrounded by the park, to be blacker than necessary. I did not ask the coal to come to me in Kent at all, and if we can keep our village and my house clean I want to do it.

17,462. I agree with you—keep it as clean as possible; but the point is, are you aware that one million mine workers have been agitating for many years to get more shafts put down in order to make it possible for the miners to get out of the pit in the event of an explosion or any other accident taking place?—No, I certainly was not aware of that.

17,463. Are you aware that we have asked there should be a shaft sunk at least every mile, and that no part of the working should be more than a mile from the pit bottom?—No, I have heard nothing of that at all.

17,464. That is in the interests of safety?—No, I am not aware of that.

17,465. Are you aware that normally the further people are away from the pit bottom the more dangerous it may be in the event of any serious accident taking place?—Yes, I suppose so.

17,466. In this case, here is a company evidently prepared to sink a considerable amount of capital in making another pit which they thought was necessary for the proper working of these minerals, and you step in and say that they are not to be allowed to sink that pit. That, I take it, would be the position taken up?

Mr. Turner: There was no actual proposition to sink. They made no definite proposition to sink at all.

17,467. (To Mr. Turner.) Why did you prohibit their sinking?—We wanted to protect the village and keep it clean, and not to have unnecessary pits sunk.

17,468. If any proposition was made to sink, why should you prohibit it?—I did not say a proposition had been made, but we did not want it there at the time in case one was made.

17,469. What distance would they require to come from the bottom of the existing pits to work the

whole field?—With regard to the two pits, as they are now, I should say the distance between the two would be three to three and a half miles.

17,470. Between the two pits?—Yes.

17,471. How far would it be from either of the two pits?—Half of that would be one and three-quarter miles.

17,472. And you think as a mining engineer it is a reasonable position to take up when the workings may extend and, indeed, must extend if that field is exhausted, to one and three-quarter miles from the pit bottom?—That is between the Snowdon and the Wingham pit. There may be pits further to the east which would come in there.

17,473. As a matter of fact you intend to work those two pits through to each other, do you not?—That would be so.

17,474. And it would be three miles between the two pits?—Yes.

17,475. When working in other directions to the boundary of the coal field you say the extent would be one and three-quarter miles?—From each pit bottom to the half way line.

17,476. Between the pit bottom and the extreme of the coal field?—That is a distance which is worked now, and much greater distances than that. You can take it at about one and three-quarter miles in this case, but I have not measured it exactly on the map.

17,477. Do you think the persons who sink their capital in boring and proving the mineral field and sinking the pits there at a cost of half a million of money, or a quarter a million of money, and who are to be responsible for the safety of the men, or the holder of the land would be the best judges as to where to sink their pits and how to conduct them?

Mr. Plumptre: My answer to that is that I do not think the then manager was thinking of the safety of the mine. He only thought how he could multiply more the companies to carry on the business of Kent coal, and if it had occurred to us in any way that it was bad for the getting of coal or injurious to human life, we should not have thought of putting in these restrictions. I am certain it never occurred to us in the light which you put it to me this morning at all.

17,478. Did you agree with the manager when he said five hundred acres would be sufficient?—No, I did not.

17,479. Did you pit your knowledge of mining and safety against his knowledge?—I do not think he was thinking of safety.

17,480. Was his anxiety to raise money?—I do not know, but I should think it was.

17,481. Could you give the Commission any idea of the amount of money that has been lost in the development of the Kent coal?—I could not tell you that, but I do not think the Kent Coal Concessions' money is all lost by any means.

17,482. I think at the first attempt at sinking there those engaged in sinking had a very heavy growth of water?—Yes, in places.

17,483. And they had to stop sinking once or twice through running sand and water?—Yes.

17,484. Did they not require again and again to raise money by appealing to people outside mining altogether? Have you heard that that was the case?—I believe they did.

17,485. Have you any money invested in the development of the coalfield which you own?—Very little in the Kent Coal Concessions.

17,486. Is it the case that you would not risk it?—I had not got it to put in.

17,487. We were told yesterday that there were what was known as the Pioneer Boring Company; do you know anything about it?—No, I do not think so.

17,488. It is a company which evidently has bored over Kent, and it is said they bored over Yorkshire and Nottingham. Have you heard of it?—I do not remember the name. That was not the company that put the borings down on my land.

17,489. That is not the company? I do not remember the name.

14 May, 1919.]

MR. HENRY FITZWALTER PLUMPTRE AND MR. DAVID NEVILLE TURNER.

[Continued.]

Mr. Turner: There was a boring company connected with the Concessions Company, but the ramifications of the Kent Coal Concessions I think would require a Commission to themselves to sort them out.

17,490. (To Mr. Plumptre.) I believe it would. We may have one in the end, but in the meantime we will get on. A director of the Kent Coal Concessions working part of your minerals was in the chair yesterday giving evidence?—Yes, one of the new directors since the war. He came in to help them out of their troubles since the war, or so I have understood.

17,491. There has been from time to time a shifting of directors and others coming in to help, and this is just an additional one. But he also evidently is connected with the Pioneer Boring?—I daresay, but I do not know.

17,492. That is not the firm that was doing the boring on your land?—No.

17,493. Had you any arrangements with the borers to prove your coal and that, if coal was found there,

a certain part of the royalty rent should go to them for their boring?—No; they were not employed by me at all. They were employed by the Kent Coal Concessions.

17,494. And the Kent Coal Concessions were leasing from you?—Yes.

17,495. You do not know whether there was any arrangement of that kind?—No.

17,496. You had no arrangement with anybody that part of your royalty rent should go to the borers?—No.

17,497. That is to say, you did not anticipate paying anything at all to the persons who proved your coal?—No.

17,498. Mr. R. W. Cooper: (To Mr. Turner.) Could I see the option agreement which you referred to?—I have a rough draft here; that is all.

17,499. I mean the thing which was signed before the lease was signed?—Yes. (Handing document.)

(The Witnesses withdrew.)

MR. JOHN DEWRANCE, Recalled.

Witness, addressing Chairman: Sir, before I was examined, you kindly read out the names of the Pioneer Companies that I represent. The Pioneer Companies are stated in this Appendix A.

Chairman: Yes, I read them out.

Sir L. Chiozza Money: Sir, could the essential clauses in these leases be printed?

Chairman: Yes. What would you like: the habendum or the term?

Sir L. Chiozza Money: It is those parts which give the term.

Mr. R. W. Cooper: I shall be very pleased to make the extracts and you will see exactly what it is. I suggest you should have the description of the area demised, the liberties demised, the restrictions, the conditions, the length of the lease, the rents, dead rents, and so forth.

Sir L. Chiozza Money: Yes. May I ask for one other thing, and that is the list of the financial concerns which have been concerned with the exploitation of these properties, because it seems to me to throw such a valuable light on the exploitation of new coalfields under the present system?

Chairman: We will try and get that.

Mr. R. W. Cooper: There I cannot help you.

Witness: There are 175 leases.

Chairman: We will be content with a few.

Witness: I have something like 100 leases on a chart giving all that information which I had yesterday. (Chart produced.)

17,500. Sir L. Chiozza Money: (To the Witness.) Do you mind telling me who printed this *précis* which you kindly let us have?—The solicitors for the companies I am representing.

17,501. You have given such a lot of attention to this boring work: Do you find that the system of desultory boring gives the best results from the national point of view?—It is not desultory boring. It was bored on a plan. Take, for instance, South Yorkshire: The end of the coalfield was at a certain point; then another bore was put beyond that, and so it goes on. The Pioneer Companies put in these borings, and there they have proved 300 square miles extra coalfield.

17,502. My point is, do you think that that constitutes a systematic exploration of the coal resources of the country?—It has done in these cases.

17,503. You have very kindly put in an appendix. With regard to what Sir Aubrey Strahan says about these matters, do you think what he says bears out your opinion?—His information is based entirely upon such borings.

17,504. And he complains that he cannot get the information?—He was not right in doing that. As I pointed out yesterday, I was present when he read that paper before the Royal Institution, and I told him immediately, afterwards he ought not to have printed that without asking for the information, and he had it immediately after.

17,505. Are you aware that all the eminent geologists agree with Sir Aubrey Strahan?—That they cannot get information?

17,506. Not only that they cannot get information but that, firstly, systematic exploration is not done or even attempted, and, secondly, that what exploration is done or attempted is not properly recorded. Are you aware that that is the opinion of geologists?—That may be his opinion.

17,507. Are you aware that it is the opinion of Professor Watts, the late President of the Geological Society?—No, I have not read that.

17,508. May I put it to you. Here is his address to the Geological Society in 1912: "Further, there seems little doubt that in many instances, and especially under the unsatisfactory conditions which at present prevail, much of the money so spent if not actually wasted, as has frequently been the case in the past by selection of spots where geological research had already demonstrated that no coal exists, may nevertheless appear to have been uselessly thrown away." Do you think that is a fair statement?—It is his opinion, but it is the opinion of people who put the bores down that coal might exist there, or they would not have put them down.

17,509. Do you think there is a proper co-ordination of geological and engineering knowledge in this matter for the nation as a whole?—It is difficult to answer. Geologists differ, as doctors do.

17,510. Do you not yourself say in your proof that it is a most hazardous work, and that you have to work in the face of discouragement and scepticism from experts in the industry?—So will the Government if it is nationalised.

17,511. But you do have to work in the face of discouragement?—Yes.

17,512. Do you think a Minister of Mines would discourage you?—No, but he would be discouraged by deputations from the people who opposed the development of the coal.

17,513. Do you think he would be discouraged as much as you, as a private individual, with all the difficulties of getting capital for a very hazardous venture?—He would have probably more difficulty in getting money from the Treasury than we do from the public.

17,514. Is it not exceedingly difficult to get people to put up money to do this work?—I have not had the experience, but it does not appear from the past to have been so, because they have obtained it.

17,515. Does it not follow from what you say here that it is so? Do not you yourself express it in your *précis*: "The Pioneer Company has to bear these" (that is, the risk of losses), "also the cost of administration, the maintenance of its options and leases, and the loss of interest on capital, which in every case extends over a considerable period of years, and in the event of failure a total loss of capital"² There is a certain element of truth in that, because it is your own evidence?—Yes.

14 May, 1919.]

MR. JOHN DEWRANCE.

[Continued.]

17,516. Are not those things very potent in this matter? Do they not make it very difficult for you to get capital to operate with?—Well, I have not tried, but I presume it would be so.

17,517. But it must be so?—Yes.

17,518. Does it not seem clear, while the whole interests of this country are based on the coal supply, and increasing its coal supply, yet this pioneer work has to be done in these conditions of disadvantage?—But it also demonstrates that the difficulties would be so great that the probability is the Government would not do it at all.

17,519. Is it not the fact that the Government could take risks in this matter which no private adventurer could take?—Do you mean owing to their financial resources?

17,520. Yes?—I do not know that that follows, because at the present time private individuals can borrow money on more favourable terms than the Government.

17,521. Do you say that that is so at the present time?—Yes.

17,522. Then I will not put any further questions.

17,523. *Mr. R. H. Tawney*: I just want to understand this practice about borings. Are the borers under any obligation to notify to the State the results of their borings?—Not to my knowledge.

17,524. Is it possible for borings to take place on a considerable scale without the Geological Survey being kept *au fait* with the results?—I suppose so.

17,525. *Sir Adam Nimmo*: I suppose you would agree that the results of bores, where put down by your companies and other companies, should be made available to the Government?—They were directly I heard that they wanted them.

17,526. Would you agree that a complete record should be kept of all these bores which are put down?—Certainly.

17,527. So that they could be utilised by any Mining Department that was dealing with the general situation?—Yes.

17,528. You were asked certain questions yesterday by the Chairman as to the State carrying out borings. I suppose you would agree that the State could carry out borings?—Of course.

17,529. Is it your view that it would not be so likely to carry out the borings as the Pioneer Companies?—Yes.

17,530. You are quite content to take the risks involved in the work which you do?—I did not do the work, but it was done by my predecessors.

17,531. I mean the companies which you represent?—Yes.

17,532. You are quite prepared to go on taking the risks of doing the work which you are doing?—Yes.

17,533. Do you believe that that work will result ultimately in the disclosure of available areas of coal?—It has done so.

17,534. And you are aware, are you not, that colliery companies do a great deal of this work themselves?—Yes.

17,535. Have you always found that private capital has been readily available to take up any mineral propositions which you have disclosed, generally speaking?—At the present time it is available subject to the findings of this Commission.

17,536. When you disclose a coalfield of any value, have you found any difficulty in placing that coalfield in the hands of practical people who would develop it at once?—No.

17,537. Do you expect any difficulty in that direction in the future?—No.

17,538. *Sir Allan Smith*: There is a point upon which I should like to be quite clear, with regard to the dead rents of the Kent Coalfield. We have had many instances afforded us of concessions made by royalty owners when the companies were in difficulties on the representations of the companies. Have you made representation to the landlord?—Yes. When the war broke out I called all the landlords together and the large majority of them forewent their dead

rents for the period of the war and for three months after.

17,539. Absolutely?—Yes.

17,540. In the case of Mr. Plumtre, he says no rent has been paid during the war. Has the obligation to pay the rent been discharged?—No.

17,541. Therefore you are still liable?—Yes.

17,542. In his case did you make representations?—Yes.

17,543. Has he made any concessions to the Kent Companies in respect of the financial difficulties they have been harassed with?—Negotiations are proceeding with a view to his granting quite a different lease which would involve that concession, but it has not been signed yet.

17,544. Has he actually made any concessions?—Not to my knowledge.

17,545. And you are now faced as a coal company with the arrears of royalties from the commencement of the war?—Yes.

17,546. *Mr. Smillie*: Do you know the early history of the development of the Kent Coalfield?—Only from reading the subject.

17,547. Have you read carefully the history of it? There was an answer given to Sir Adam Nimmo with regard to it, and I want to deal with it. You say there is no difficulty in getting persons to put money into a concern for the purpose of the development of a known coalfield?—I do not say there is no difficulty.

Sir L. Chiozza Money: That is what you said.

Witness: The difficulties are not insuperable. There are difficulties in all business transactions. We have now three large companies who are prepared to take up very large tracts of this area, and the principal part of this area, subject to the findings of this Commission, immediately after the war.

17,548. *Mr. Robert Smillie*: Sir Adam Nimmo put a leading question to you, that you do not find any difficulty in raising money to develop a coalfield, and you said no?—I think that is correct.

17,549. Do you remember the name of a gentleman named Burr in the City?—I know his name.

17,550. Do you know that he had something to do with the early struggles of the Kent coal development?—Yes.

17,551. Do you know he issued statements again and again for the purpose of trying to get some money put into the concern?—Yes.

17,552. Do you know he stated that they had secured the services of an eminent mining engineer, Mr. John Hamilton, from Scotland, who would, with his skill and knowledge, put the Company on a good footing, and all they wanted was money to develop?—I should be sorry to be responsible for all his statements, but I think I remember that.

17,553. Do you know John Hamilton was not a mining engineer and had hardly ever been down a pit in his life?—I did not know that.

Sir Adam Nimmo: Before Mr. Smillie asks another question, may I say that my question was intended to be a general question? This witness represents boring which has been done in other parts of the country, apart altogether from the Kent Coalfield.

Mr. Robert Smillie: At the moment we are dealing with the difficulties of Kent coal, and Sir Allan Smith has brought out the point, really. I took it for granted from the landowner that the dead rent had been stopped during the war. Sir Allan Smith has now brought it out that it is only held in abeyance, and up to the present time it is a debt over the Company.

Witness: Yes.

Sir L. Chiozza Money: May I ask, sir, for the information of the Commission—

Chairman: No.

Sir L. Chiozza Money: It is not a question. There is a very valuable account of the Kent Coalfields in Jevons's book.

Chairman: I know it by heart now, but we cannot put books in evidence. Anyone who wants it can purchase the book for 6s., and I hope they will read it.

(The Witness withdrew.)

14 May, 1919.]

MR. EDWARD OTTO FORSTER BROWN.

[Continued.]

MR. EDWARD OTTO FORSTER BROWN, SWORN and Examined.

STATEMENT BY MR. E. O. FORSTER BROWN ON
GEOLOGICAL AND MINING CONDITIONS AND THE
GENERAL POSITION IN KENT.

I, Edward Otto Forster Brown, am a member of the following:—

The North of England Institute of Mining Engineers;

The South Wales Institute of Engineers;

The Iron and Steel Institute;

The American Institute of Mining and Metallurgical Engineers;

Fellow of the Surveyors' Institute,

and a member of other technical societies.

I have been engaged as Consulting Mining Engineer for the last twelve years specialising in coal and iron ore in Mexico, the United States of America, Canada and Great Britain. I also studied mining in various parts of Great Britain, the Continent, South Africa, North America and Asia for seven years prior to that period.

During the last 6½ years I have been established as a Mining Engineer in London and professionally associated with mining operations in South Wales, Durham, North-West France, Spain, North Africa, and particularly in Kent, as during the last six years I have made a detailed study of the Kent coalfield and its past history.

I act in Kent as consulting engineer to Messrs. Dorman Long & Co., Ltd.; Messrs. Bolekow Vaughan & Co., Ltd.; the Channel Steel Co., Ltd., the principal shareholders in this Company being Messrs. Dorman Long & Co.; Messrs. Bolekow Vaughan & Co. and Messrs. Bell Brothers, Ltd.; as consulting engineer to Messrs. Schneider et Cie, of Le Creusot, France; as mining adviser to the First Mortgage Debenture holders of the East Kent Colliery Company, Ltd., and in a professional capacity as adviser to other interests to a lesser extent.

I have utilised opportunities of investigating the various sinking and boring operations which have taken place in the Kent coalfield during the period referred to, and am fully informed as to the results of these sinkings and borings. (See Appendix.)

The Kent coalfield is unique amongst the coalfields of commercial importance in Great Britain in view of the fact that the coal measures are everywhere covered by an unconformable capping of rocks of a later age. This capping at no point is less than 800 feet and on the average is 1,100 feet thick; deep borings are necessary, therefore, to ascertain the existence, character and contents of the coal measures beneath.

Further, to enable the value of the minerals proved by boring to be ascertained definitely, shafts have to be sunk through the capping referred to, which in places is heavily watered and consequently the cost of sinking is abnormally high. In other British coalfields the winning of the minerals at a depth is usually a less speculative enterprise as the general character of the seams has been established by workings where they approach the surface and where they can be opened up at comparatively little expense.

The work done in Kent up to the present has been entirely pioneer in character and carried out by private enterprise. Since the year 1886, but more particularly during the last 14 years, 40 boreholes have been put down comprising a total of 90,000 feet of boring. Of these boreholes 29 proved coal measures, seven proved to be outside the coalfield, one was not prosecuted deep enough to prove the coal measures, and three were put down to prove the iron ore which occurs within the capping of rocks overlying the coal measures. Particulars as regards the names, dates (where obtainable) and depths of these boreholes are given in Table I. accompanying this evidence.

The information obtained from these borings has been supplemented by seven collieries and one iron mine at a more or less advanced stage of development; four of these have penetrated the coal measures and two of them have worked over an area of approximately 800 acres in one of the upper seams of coal. The amount of sinking represented by these seven collieries and iron mine totals 19,000 feet. The positions of the various boreholes and collieries are shown on the plan produced. The amount of money actually spent in taking up leases and getting together areas, boring, sinking, equipping, developing and other charges in connection with the development of the coalfield cannot be ascertained with precision, but totalled not less than £3,500,000 up to the end of 1918.

The expenditure and work indicated has established the existence of a coalfield of approximately 250 square miles in extent, of which I estimate 105 square miles contain an average of 23 feet of coal of good average quality in seams of three feet thick and upwards within a depth of 3,000 feet from the surface, or, deducting 25 per cent. for inferior quality and unworkable conditions, 17 feet of coal, lying within 3,000 feet of the surface in seams of three feet thick and upwards, equal to 1,370,880,000 tons of coal.

In my opinion the natural conditions under which these reserves of coal occur should enable them to be developed and worked and the coal or its products delivered to consumers at a cost which will compare favourably with the cost of coal or its products from other British coalfields worked under corresponding industrial conditions.

In addition to the foregoing the borings and iron mine referred to have proved the existence of a deposit of 120,000,000 tons of iron ore, which, in conjunction with the development of the coal, it is considered can be converted into iron and steel successfully at competitive prices.

The whole of the work indicated has been carried out by and at the expense of private interests; it is essentially pioneer work in character and still requires a certain amount of supplementary similar work and expenditure to enable the field to be developed to best advantage.

The interests who are responsible for this expenditure have received no return up to the present other than the knowledge they have obtained as to the natural conditions of the field, and it is on the basis of this knowledge that they expect to recoup themselves in the future for the expenditure they have incurred in the past.

The question of the most efficient method of developing this coalfield in the interests of the nation as a whole seems to me to bring forward the following preliminary considerations:—

The futuro of the following interests, i.e., whether they are to be allowed to go on as they are, and if not how they are to be dealt with:—

- (a) Pioneer companies which have gone to the expense of getting together likely colliery areas but have not yet proved the existence of workable coal seams by boring.
- (b) Pioneer companies which have got together areas and have proved their value or otherwise by boring but have not yet disposed of them to developing companies.
- (c) Pioneer companies which have disposed of areas to developing companies for cash or on the basis of a cash payment for actual expenditure and a deferred payment at the rate of so much per ton on the coal as and when produced.
- (d) Colliery companies which have acquired an area or areas from pioneer companies but have not yet developed or completed developing such areas.

14 May, 1919.]

MR. EDWARD OTTO FORSTER BROWN.

[Continued.]

- (e) Colliery companies which have got together a colliery area, have proved it by boring, and are in course of developing it.
- (f) Companies combining one or more of the five preceding cases.
- (g) The company which has acquired and partly paid for one or more colliery areas the development of which are necessary to enable the iron ore proved by the company to be turned to economic advantage.

The case of the companies which have done essentially pioneer work in character in the form of boring and getting together areas, has been dealt with fairly fully in the general case, which this evidence supplements. The interests I more particularly represent in the field are those concerned with the development of the minerals, and consist of companies which have either done their own boring or which have acquired or are acquiring mineral areas from pioneer companies who have established the existence and value of the minerals under these areas. A list of the various companies with the amount spent by them is set out in Table I, accompanying this evidence.

In the event of nationalisation, the various companies referred to would have to be compensated and remunerated and the knowledge acquired and development carried out by them would have to be turned over to the State. It is improbable that the State would be in as good a position to benefit by the experience obtained by these individual companies as the individual companies themselves, in view of the prolonged experience coupled with heavy expenditure which the majority of them have undergone.

A further consideration would then be whether the State would feel justified in laying out the further expenditure necessary to obtain the full benefit of the experience acquired and the expenditure incurred.

The output of the field at present is about 300,000 tons per annum. As matters stood until recently, however, a number of strong interests were on the point of developing the field on a large scale as soon as normal conditions would permit. The prosecution of these developments has now been suspended (where the interests referred to were not already too far committed), partly due to the uncertainty as to whether the mines are to be nationalised or not, and partly due to the fact that in view of the recent recommendations of the Coal Commission, it is uncertain whether it will be worth while developing this field on the basis of these recommendations.

The interests referred to which intended to develop the field on a large scale consist, amongst others, of:—

The Channel Steel Company, Ltd.;
Messrs. Dorman Long & Co., Ltd.;
Messrs. Bolekow Vaughan & Co., Ltd.;
The Chislet Colliery, Ltd.;
Messrs. Schneider et Cie. of Le Creusot, France;
The Forges de Chatillon, Commentry et Neuves Maisons,

while the East Kent Colliery Co., Ltd., and the Snowdown Colliery, Ltd., are actually producing coal at the present time from one of the shallower seams in the field and are responsible for practically the whole of the output obtained.

I am of the opinion that the natural conditions now known of the field are such that it is justifiable to estimate an output of 10 million tons per annum can be developed and maintained within seven years' time, subject to adequate inducement being provided for the expenditure of the necessary sum to enable this output to be attained.

The securing of the major proportion of this output will be dependent upon future capital expenditure and in this connection it should be borne in mind that the capital cost per ton of output per annum from developments of this character will be heavier

than in the case of existing collieries, due to the fact that relatively greater sums must be paid for wages and plant and housing facilities at the present time, consequently the remuneration per ton of output obtainable will require to be considerably greater in proportion than in the case of collieries developed and equipped when the rates of wages and the cost of plant were lower.

Dealing with the question of possible benefits obtainable from co-ordination of the interests in the field, this feature has by no means been overlooked in Kent. In the autumn of last year, prior to the time when the existence of the present Coal Commission was not even contemplated, I put before various interests in the field a joint co-operative scheme for the establishment of joint services in which co-operation seemed to me likely to prove of greatest benefit. These joint services included more particularly a joint electric power supply with a view to enabling the bulk, if not all, of the collieries to use solely electrical power generated at one or more joint stations which it was proposed should be situated in the immediate neighbourhood of the site for a port where it was also contemplated blast furnaces, steel works, coke ovens, washeries, and briquetting plants in connection with the coal and iron output of the field would also be situated and thereby enable the bye- and waste-products from works of this description, such as surplus gas, waste heat, coke oven breeze, etc., to be rendered available for the generation of electricity at a minimum cost; the purchasing of standard materials used at all collieries, such as timber, steel, etc., by co-operative purchase; the furnishing of repair shops for carrying out large scale repairs too large as a rule for any individual colliery to undertake; the equipment of a laboratory to experiment upon and deal with the various problems arising in connection with the Kent coals and their manufacture or distillation to the best advantage; a joint rescue station; a co-operative sales department, and any other co-operative services likely to be of benefit to the field as a whole. The principle of this scheme was generally agreed to and progress in its materialisation has only been hindered by default of information as to

- (1) Whether the field is to be nationalised, or
- (2) If it is not nationalised, whether it is going to be worth while to develop it in view of the Coal Commission's previous report.

Dealing more particularly with the specific interests I represent, the Channel Steel Company has spent a large sum of money, through the companies of which it forms the fusion, in proving the existence and character of an important deposit of iron ore in the south-west of the field. To enable this iron ore to be turned into iron and steel, an adequate supply of fuel is necessary, and with this object in view Messrs. Dorman Long & Co., Ltd., and Messrs. Bolckow Vaughan & Co., Ltd., who hold a large interest in the Channel Steel Company, have acquired an area of 4,700 acres of coal from a pioneer company, viz., the Betteshanger Boring Company. This area has been proved by boreholes within and around it to contain approximately 140,000,000 tons of coal in workable seams of three feet thick and over within limits of 1,500 and 3,000 feet from the surface. To recoup themselves for their expenditure, the Channel Steel Company will require to spend a sum of at least one and a half million pounds in blast furnaces and steel works, and a further sum of from one to one and a half million pounds in developing the Betteshanger area and providing the necessary coke ovens to supply the blast furnaces with fuel and the steel works with gas. They will, however, require security of tenure and freedom as regards management to enable them to develop and work these coal reserves upon the successful development of which the success of an iron and steel industry in Kent, likely to be of great national importance, is dependent.

Messrs. Schneider et Cie. and the Forges de Chatillon, Commentry et Neuves Maisons have acquired or are acquiring areas of minerals of

14 May, 1919.]

MR. EDWARD OTTO FORSTER BROWN.

[Continued.]

approximately 8,000 acres in extent, on a portion of which two shafts have been sunk to a depth of 1,300 feet and are in course of being proceeded with to develop the coal. The importance of this development by the French companies referred to is not in my opinion limited to any immediate benefit which may accrue to the French companies themselves. The fact that it is proposed to put up plant to manufacture iron and steel in Kent will also create a demand for iron ores from abroad and the economies in sea freight resulting from the carriage of coal worked by French interests in Kent to French ports and the return carriage of iron ore, as for instance from north-west France and Brittany, to iron and steel furnaces in Kent, is one of importance in looking at the development of this field from a national point of view.

The developments of the Chislet Colliery, Ltd., are on the point of providing an additional important output of coal from the Kent coalfield to local consumers, who in the majority of cases at the present time have to obtain coal from other British coalfields

which it is undesirable should be carried by rail to this neighbourhood if it can be produced on the spot.

Both the East Kent Colliery Co. and the Snowdown Colliery, Ltd., have only been deterred by the abnormal conditions due to the war, and the difficulty of raising the necessary capital occasioned thereby, from sinking their shafts to win the coal seams underlying their areas of more importance than the seam they are working at present and which are known to exist at a greater depth.

The early development of the field to its maximum capacity of output is also desirable from a broader aspect. The consumption of coal in Kent and neighbouring counties is in excess of 2,000,000 tons per annum, while the consumption of coal in London is in the neighbourhood of 17,000,000 tons per annum, and this coalfield is situated in closer proximity to both these markets and to the more immediate foreign markets than any other coalfield in Great Britain. Table II. attached hereto illustrates this point.

E. O. FORSTER BROWN.

London, April 23rd, 1919.

17,554. *Chairman*: I believe you are a member of the North of England Institute of Mining Engineers, the South Wales Institute of Engineers, the Iron and Steel Institute, the American Institute of Mining and Metallurgical Engineers, and you are a Fellow of the Surveyors' Institute, and a member of other technical societies?—Yes.

17,555. Have you been engaged as consulting mining engineer for the last 12 years, specialising in coal and iron ore in Mexico, the United States, Canada and Great Britain, and have you also studied mining in various parts of Great Britain, the Continent, South Africa, North America and Asia for seven years prior to that period?—Yes.

17,556. I think you have acted for a great number of people?—Yes.

17,557. You have sent us a very long proof, and this Commission has not time to go into the minute details of every coalfield in the United Kingdom, because it would be quite impossible to do it. There are pages and pages of it, and I regret to say that we have not the time to read it. I will take you through some parts of the proof that seem to me material. Will you go first of all to page 3, where you say: "The question of the most efficient method of developing this coalfield in the interests of the nation as a whole seems to me to bring forward the following preliminary considerations:—

The future of the following interests, *i.e.*, whether they are to be allowed to go on as they are, and, if not, how they are to be dealt with:—

(a) Pioneer companies which have gone to the expense of getting together likely colliery areas, but have not yet proved the existence of workable coal seams by boring.

(b) Pioneer companies which have got together areas and have proved their value or otherwise by boring, but have not yet disposed of them to developing companies.

(c) Pioneer companies which have disposed of areas to developing companies for cash or on the basis of a cash payment for actual expenditure and a deferred payment at the rate of so much per ton on the coal as and when produced.

(d) Colliery companies which have acquired an area or areas from pioneer companies, but have not yet developed or completed developing such areas.

(e) Colliery companies which have got together a colliery area, have proved it by boring, and are in course of developing it.

(f) Companies combining one or more of the five preceding cases.

(g) The company which has acquired and partly paid for one or more colliery areas the developments of which are necessary to enable the iron ore proved by the company to be turned to economic advantage."

Then you say: "In the event of nationalisation, the various companies referred to would have to be compensated and remunerated and the knowledge acquired and development carried out by them would have to be turned over to the State. It is improbable that the State would be in as good a position to benefit by the experience obtained by these individual companies as the individual companies themselves, in view of the prolonged experience coupled with heavy expenditure which the majority of them have undergone. A further consideration would then be whether the State would feel justified in laying out the further expenditure necessary to obtain the full benefit of the experience acquired and the expenditure incurred"

17,558. Then you deal with a great number of matters, and you exhibit certain tables. Table I. shows with regard to Kent the name of the company, the bore, when it was commenced and finished, the depth and the cost, and that is a very useful table. Then Table II. is a table showing the comparative distances to London by rail. We need not have gone into that, because the A.B.C. would tell us that. It also shows the comparative distances to London by water, and the comparative distances to foreign ports in nautical miles. We are very much obliged to you for your proof. Do you want to add anything about the Kent Coalfield itself?—No.

17,559. *Sir L. Chiozza Money*: On page 7 you refer to Messrs. Schneider et Cie. Do you not think it rather extraordinary that it should have been left to this great French firm to develop the minerals of the United Kingdom?—They have not developed them.

17,560. Well, to proceed to develop or to propose to develop them?—They have not decided to develop them.

17,561. In precise language you say that they have "acquired or are acquiring areas of minerals of approximately 8,000 acres in extent." Does not that justify the language I used?—Generally speaking, yes.

17,562. Then may I ask why you gave that answer to my question?—I wanted to be quite sure specifically what it meant.

17,563. I referred to what you state. You say this great French firm "have acquired or are acquiring areas of minerals of approximately 8,000 acres in extent, on a portion of which two shafts have been sunk." Then I asked you this question: Is it not rather remarkable that it should be left to this great French firm to develop the United Kingdom's minerals, and you returned the answer, of which I remind you, that they have not done anything of the kind or words to that effect. Do you want to amend your answer?—I understand the meaning of your question now, and I am in a position to deal with it. I do not think it is extraordinary.

Sir L. Chiozza Money: I will not ask you any further questions.

14 May, 1919.]

MR. EDWARD OTTO FORSTER BROWN.

[Continued.]

Sir Adam Nimmo: Sir, I see the witness has had experience of mining in America. May I ask a question on that?

Chairman: Certainly.

17,564. *Sir Adam Nimmo (to the Witness):* I understand you have had considerable experience of mining in America?—Yes.

17,565. What would you say as to the equipment of mines in America as compared with the equipment of mines in this country?—I should say on the whole the equipment installed is inferior in quality and condition to the mine equipment of this country. As a rule it is not so substantial and efficient of its kind to start with. I should not say it is kept up to such a good standard of efficiency. Mechanical appliances for coal cutting and getting are employed to a greater extent than in this country.

17,566. Is that largely due to physical conditions?—I think it is due to two main causes: Partly the physical conditions under which coal is worked in America are better, but also I am of opinion that American labour has grasped to a far greater extent than labour in this country has grasped the fact that the soundest route to improve its position and reduce its employment is to get the maximum output per unit of labour employed, compatible with health and safety, either by direct manual labour or the help of machines.

17,567. *Chairman:* Are you reading from something?—Yes.

17,568. Could you let us have it?—I have this paper but it is my only copy.

17,569. Then we will not trouble you for it.

17,570. *Sir Adam Nimmo:* Is there any reason why reflection should be cast upon the efficiency of the working in this country in respect of the plant that is employed as compared with other countries which you have knowledge of?—No, I should say not.

17,571. Would you say our standard was higher?—In most respects, yes.

17,572. Would you say we brought such skill and enterprise to bear upon our problems as are brought to bear upon those in the other countries you know of?—Yes.

17,573. You were speaking of the attitude of American labour. Do you think that the outlook of American labour is rather different from the outlook here?—Yes, I think it is. I think they take a longer view of the soundest policy in the long run than they do here.

17,574. Is there anything in the nature of restriction of output in the American mines?—I have not seen it.

17,575. Does there seem to be a general desire to increase production as much as possible?—Yes, I should say there was.

17,576. Do you think that that ultimately leads to a higher level of wage?—Yes, because the net result is that it tends to reduce the cost at which you can produce the mineral, and that leaves more room for wages and widens your market, and that again tends to require new fields developed and tends to decrease unemployment.

17,577. Would you say that that after all is the secret of industrial expansion?—I should say so.

17,578. *Mr. Herbert Smith:* Will you tell us in what part of America you devoted your attention to getting this information?—Texas, Maryland, the Connsville region, and West Virginia.

17,579. Am I right in saying that about 70 per cent. of American coal is got by machine?—I do not know whether you are right or not.

17,580. Well, you should know?—I do not think I should necessarily know the exact figure.

17,581. You cannot answer that question at all?—I cannot tell you whether it is 70 per cent. or what is the actual percentage, but it is a considerable percentage.

17,582. You say American workers have a wider outlook and do not restrict their output. In com-

paring the output, ought you not to take the conditions under which the men work?—I quite agree.

17,583. So that if coal is being got by machine on the one hand and manual labour on the other, it would not be fair to make a comparison of the two?—It depends upon what encouragement was given to the machine to do its work.

17,584. Do not avoid answering this question. Would it be fair to take you and me in comparison, you filling coal with a machine and me getting coal by hand?—In the same seam and under exactly the same conditions, yes.

17,585. I should be getting it by hand and you would be getting the benefit of cutting by machinery, and you think it would be fair to take a comparison on those conditions?—I think the person with the machine under the same conditions, where the conditions were favourable for the machine, would be better off than the manual worker.

17,586. The question I asked you is very easy to answer. Is it fair to compare one minor working with a machine, getting 7 tons with a machine, and another man working by hand and getting 2 tons?—No.

17,587. Will you tell us what the wages were in America when you were there? When were you there?—I was there at various times from 1907 to 1912 inclusive.

17,588. *Sir L. Chiozza Money:* Have you the wages when you were there?—Yes. At one colliery it was 12s. and at another 10s. per shift for the hower.

17,589. *Mr. Herbert Smith:* Is that 1907?—Yes.

17,590. That is a guaranteed minimum, is it not?—I do not know whether it was that or not.

17,591. I want to put it to you that that is a guaranteed minimum wage in 1907. 12s. was the minimum?—It was the average earnings per hower per shift.

17,592. Will you tell us with regard to your American knowledge whether there are as many men employed away from the face in transport work in America as there are in this country? Take the hewers at the face, and then take the number of men who are wanted as between the hewer and the pit top to land the coal?—I should say the proportion of hewers is rather less in the States from my observations.

17,593. I want you to tell us this if you can: Supposing there were 500 men employed in a mine to get coal out of that mine and send it to the surface, how many men would be employed away from the face and how many at the face?—It depends upon the mine and the conditions.

17,594. I put it to you that they average in America about 1 in 5 against as to 1 and 1 in this country?—I have no means of checking that figure.

17,595. You have answered *Sir Adam Nimmo* certain questions, and we want to know whether we are up-to-date?—I answered those questions from my general observations in America. I have not specific figures of those observations, except the known figures which indicate that the output per man employed is considerably greater than in this country.

17,596. We will deal with that later on. What I ask you is, if America is not as well equipped as us, why is it not so well equipped? Let us get at it in another way if we cannot get it that way?—It is the general policy of American mine managers, I should say. The fact is that in my opinion the American mine is not so well equipped. I did not go into the question of why it was not so well equipped, but it is the fact.

17,597. Did you know you were going to be asked questions with regard to America?—I thought I very probably should be, and I mention the matter in my proof.

17,598. You read from some paper?—Yes, and I have papers on a lot of things.

14 May, 1919.]

MR. EDWARD OTTO FORSTER BROWN.

[Continued.]

17,599. I want to see how much you know about America, because you have answered certain questions put by Sir Adam Nimmo, and I want to put it to you that we are not so well equipped for transport of coal out of mines in this country as they are in America—and that is from practical experience?—I think in this way we are not so well equipped, that we do not use underground electric haulage on the overhead trolley wire system to anything like the same extent. We are not allowed to by our safety regulations.

17,600. There are seams where it is allowed?—Yes, there are seams where it is allowed. What I mean to say is that the safety regulations, at any rate until recently, have not been so elaborate and detailed in America as they are in this country.

17,601. Will you tell us how they get at their output? What we say in this country when we are talking about output is, there are a thousand men and boys employed in that mine, and their output is so much. In America is it not the fact that they give you the coal hewn separate, and say so much per ton of coal hewn?—No; I have seen figures based on per man employed.

17,602. Do not the figures which have been placed before this Commission say so much per coal getter?—No. The figures I gave you from my own notes were so much per coal getter, but the figures from the United States are per person employed.

17,603. You cannot tell how many men are employed away from the face?—No, I cannot tell you the proportion away from the face.

17,604. *Mr. Robert Smillie*: You say between 1907 and 1910 you had experience in America?—Yes.

17,605. Were you there continuously during that time?—No.

17,606. What period of time did you spend there?—I should think altogether at one time or another I have been six months there.

17,607. Were you there as a visitor?—Partly as a visitor and partly professionally.

17,608. How did you become acquainted with the conditions there? Was it from your observation or from reading?—From both, and from discussion with American people.

17,609. Do you think that going there only occasionally would give you a knowledge of the true state of mining in America?—I think it would be sufficient to enable me to form an opinion on the subject.

17,610. Can you tell me how many seams in America they are working 2 ft. thick?—No.

17,611. Can you tell me how many seams they are working 3 ft. thick?—No.

17,612. Can you tell me whether they are working any seams under 3 ft.?—I have seen one being worked just about 3 ft. I cannot remember whether it was just under or just over.

17,613. Where was that?—That was at Steuhenville on the Ohio river.

17,614. Do you know that the seams there average 10 or 12 ft. thick?—The average thickness of the seams I have seen was not 10 ft. thick.

17,615. Did you see all the seams there?—No, and I have never seen an official average.

17,616. Are you aware that in West Virginia during the period you have spoken of the workmen were not allowed to organise?—No, I am not.

17,617. Are you aware that a man went from the American Organisation to organise the men there, and that there was a man put on the track to shoot him?—No.

17,618. Are you aware that mining there was practically slavery?—No, I have not heard that.

17,619. Have you heard that 80 per cent. of the workers there are what are called foreigners—that is to say, not British speaking people, but from the Continent?—My impression of America is that the major proportion, or a very large proportion, have only recently come from the Continent. The immigration is terrific

17,620. Do you know whether or not there was any organisation of the workmen?—I do not know the details of their organisation, but I believe they had one.

17,621. Do you put the American miner on a higher level than the British miner?—Not the miner, but I think his policy is sounder.

17,622. Do you think the American miners on the whole are to be compared with the British miners—I mean as workers?—I think they work harder than the British miners do at the present time.

17,623. I am trying to put to you a question that Mr. Herbert Smith tried to get out. Supposing you take in this country two collieries working side by side on equal conditions, and a 2-foot seam at coal is being worked in the same seam by the colliery, in one case by machinery and in the other case it is undercut by the miners with the pick: would you compare the output per man in those two pits? Would it be fair to do so, in your opinion?—It all depends on the conditions under which that seam occurs. If it is a seam which does not lend itself to cutting by machinery it may be better to do it by hand.

17,624. I say two seams under equal conditions exactly the same?—And suitable for machine mining?

17,625. Yes—absolutely suitable. If one is worked by hand and the other is undercut by machinery, would you compare the output of the different persons employed at those two pits—would it be fair?—No, I do not think it would.

17,626. Could you not have given that answer long ago? It is quite unfair to compare the position of a seam that is exactly the same—all conditions the same—if in one case machinery is put in or it is undercut. Are you aware that in many seams in this country the men are filling 7 and 8 tons a day by the use of machinery?—You are only taking half my argument.

17,627. I want you to deal with the questions I am putting to you. Are you aware of that?—Would you kindly repeat your question?

17,628. Are you aware that in this country there are men filling by means of coal-cutting machinery 7 and 8 tons a day?—Yes, I am quite prepared to accept that statement.

17,629. Now I want to put it to you, in the same way, worked long wall, would the output amount to more than 3 tons or 3½ tons per man?—No, it would not.

17,630. Is it in your opinion fair to compare those two? Would it be fair to take those two pits and to say the men in this pit are not working so hard as the men in the other pit, because they are only putting out half the output? Do you not see that the introduction of the machinery is everything?—That is not the point.

17,631. It is the point in this country that they do not compare an output where they are working by hand with an output where they are working by machinery?—I do not think labour in this country encourages the introduction of machinery.

17,632. Do you know of any cases where they have endeavoured to prevent machinery being imported?—I have known of cases where the whole object of putting in machinery for some time was to a large extent defeated due to the action of the men.

17,633. Was it because they objected to machinery or was it because they wanted to fix a fair price?—I do not know what their object was.

17,634. Then is it fair to give an answer of that kind, if you do not know what their object was?—Perhaps I did not make that quite clear. In the case in question, a certain seam in a colliery I am connected with, 2 feet thick, 2 inches of band comes down over that seam, and in the price list it is agreed that the men should clean the coal underground seam as far as possible. There is, however, a certain amount of foreign matter in the seam, which it is not reasonable to expect the men to clean underground. Some time ago we were having trouble with dirt in the coal, and we decided to put in a screen-

14 May, 1919.]

MR. EDWARD OTTO FORSTER BROWN.

[Continued.]

ing plant with picking bolts to get rid of this foreign matter. It was known that we were going to do this, and the screening plant began to be delivered at the end of 1913. Just at that time we had an unusual amount of trouble with dirty coal. I was present at a meeting of the Committee which I attended, when the statement was seriously put forward that as we were going to put in the picking bolts the men in future need not take the trouble to clean the coal underground.

17,635. Would you say that that was an objection of the men to machinery going in?—Their objection was to cleaning the coal.

17,636. In Scotland there is a larger proportion of coal-cutting machinery than in any other part of the British coalfield. Have you ever heard of an objection on the part of the men to coal-cutting machinery going in?—No, I have not heard of any specific objection from the miners.

17,637. Have you any ground for saying that the workmen stood in the way of machinery?—I think the case I gave you was a case in point.

17,638. That was not the case of an objection to machinery?—It was an objection to encouraging the management to put in machinery.

17,639. I want to put to you that the kind of machinery that Mr. Smith had in his mind was haulage machinery as well as cutting and boring machinery. You made the remark that we are not allowed here as they are in America to put overhead electric haulage?—Under certain conditions here you may, but not in the same way.

17,640. Is there any objection at all to putting other kinds of haulage in?—No.

17,641. Then why do you raise that objection?—Because in certain conditions overhead haulage may be the most economical to use.

17,642. Are you aware that at this time the men and boys are hand drawing coal as far as 500 yards?—No, I am not aware of that.

17,643. Would you not think that it would be foolish to continue that?—It would all depend upon the coal to be handled.

17,644. And on the nature of the gradients?—Yes—on the roads and the height.

17,645. Have we taken advantage of putting in haulage machinery in this country?—I think our haulage machinery on the whole compares favourably with other countries.

17,646. Are you aware that in many cases in America the horses or mules walk into the mine from the surface with three or four empty tubs and come out with 4 or 5 empty tubs containing 2 tons of coal each?—No.

17,647. Is there anything of that kind in Scotland?—No, we have not the gradients nor the heights.

17,648. Is it fair to compare the conditions in America with the conditions in this country when you know that here we are working at a greater depth and we have not the machinery that they have in America?—My point is that, making due allowance for the more favourable national conditions in America, this country, as far as labour is concerned, still fails on the point of its policy it adopts: When you increase the wages per shift in this country the output per shift goes down.

17,649. Do you say that that is a general thing in this country?—I say so from my personal experience.

17,650. Will you take it from me that the three men sitting here representing the miners have as much experience as you have?—Very possibly.

17,651. I may tell you that they will deny that statement and say it is not true. You say your experience is that when the wages are increased the output goes down?—Yes, when the wages of a colliery are increased the output goes down.

17,652. May I take it that a very large proportion of the miners in America are Scotch, English, Irish, and Welsh?—Yes, I should say they were.

17,653. Or descendants of British people?—Yes.

17,654. Have they changed their nature in any way?—I do not think they have changed their particular nature, but I think they have changed their policy.

17,655. Are you aware that in America their system is to fix up an agreement between the mine owners and the men, and whatever wages the men earn during the currency of that agreement there is no reduction of wages?—I do not know that.

17,656. Are you aware that in every State of America at the present time there is an agreement signed jointly by the miners and mine owners?—I do not know what the conditions of the contracts between the miners and the mine owners are.

17,657. Will you take it from me that there is what I say?—Yes.

17,658. Are you aware that there is no reduction of rates there, however much money a man may earn at the rates fixed?—I should say that is very probably so.

17,659. Are you aware that it is no uncommon thing in this country if a man earns an extra shilling a day that a reduction of rates takes place in a very short time?—No, I am not.

17,660. Would you be surprised to know that that is a very common thing?—I should require to know all the circumstances of the case before I answer that.

17,661. *Mr. Frank Hodges*: Coming nearer home, I think you are the technical adviser to the Copper Colliery Company, are you not?—Yes.

17,662. Do you regard that as a successful concern under your régime?—I think on the whole it is.

17,663. Since when has it begun to be a successful concern?—It has been fairly successful since I have been associated with it. It was fairly successful when I began to be associated with it.

17,664. You forget the interview with your chief, when he told me that it had not earned a single penny since he had been connected with it?—I am not responsible for what he said. I thought he said he had never received any dividend from it.

17,665. He gave the figures to show that the concern in which you are interested has shown an annual loss of thousands of pounds?—I did not accept those figures.

17,666. I want to suggest that, as far as I know, the collieries with which you have been associated have been singularly unsuccessful. I notice in your evidence the same treatment of general questions as being peculiar of your treatment on particular questions. Workmen at your Copper Pit Colliery made application to you some time ago, did they not, for an increase in the piecework rates, because they were unable to earn more money than is to be regarded as the legal minimum rates upon the existing piece rates?—That was the argument put forward.

17,667. The result was that you had a small output of coal per person employed. Do you remember that?—Due to what? I do not quite follow that question, I am sorry to say.

17,668. I do not want to go over it all again. I will try and summarise what I said in this way. Some time ago your workmen applied for an increase in their piece rates, because on your existing piece rates they could not earn more than the legal minimum wages?—Yes, that was what they said.

17,669. You refused to increase those piece rates?—Yes, I think we did.

17,670. The result is what?—The result is they did not get an increase of piece rates.

17,671. No, the result is that the workmen at your colliery, appreciating your attitude towards them in respect to wages, gave you a comparatively lower output than the workmen in the adjoining colliery?—The workmen in the adjoining colliery are working another seam.

17,672. No, it is the same seam?—You mean Pentro—I beg your pardon.

14 May, 1919.]

MR. EDWARD OTTO FORSTER BROWN.

[Continued.]

17,673. It is the same seam at higher prices, and the result is that you have a higher output per person employed; but, because of your particular method of dealing with the men and wages, in the same seam at your colliery you have lower prices and lower output. Do you think that that is likely to indicate to the workmen that that method is one which is generally in the interests of the industry?—Do you recollect the exact date?

17,674. Absolutely—because I dealt with it myself? It was 1916, was it not?

17,675. No, it was 1917?—My point is that the output per shift has decreased steadily since 1914, and the wages have increased.

17,676. I put it that it was because of that?—This did not occur till 1917.

17,677. I put it to you as a fact that the reason why the output is decreasing is because you do not treat the men with regard to their piece rates just as your neighbours treat their workmen in similar conditions?—I do not agree with that.

17,678. I put it to you as an absolute fact, with which you are perfectly cognisant, being in the negotiations?—I am not satisfied that the reason the men are turning out less coal is because we did not grant them an increase in the piece rates.

17,679. I put it to you further that men with your type of mind—I do not put this in any disagreeable sense—treating the workmen as you have treated your workmen, are responsible for the continuous agitations that have gone on in many parts of the South Wales coalfield?—Do you suggest that I am responsible for ill-treatment of the workmen because I have not granted an increase in piece rates?

17,680. I suggest that you do not understand the workmen?—I am not quite certain that I do.

17,681. *Mr. Arthur Balfour*: I take it on page 4 of your proof what you really mean to say is that these pioneer companies must be taken into consideration, should it be decided to nationalise the coalfields of this country?—Yes.

17,682. They must have compensation for the work they have done to the extent they have done it and for the obligations they have entered into?—I think they are entitled not only to compensation, but also to remuneration for the risks they have run.

17,683. The whole of the facts would have to be looked into?—Yes; each company would have to be considered on its own merits.

17,684. May I take it from you, is it your view that it would be a mistake to reduce piecework rates merely because the workers are earning high wages, the conditions remaining exactly the same?—I should not be in favour of reducing piecework rates because the men are earning high wages.

17,685. During the time you were in America did you hear anything of the restriction of output by the workers in American coal mines for any reason?—No.

17,686. Is it your experience that the same workers when they get to America, under the intensified conditions under which they work there, do work harder than they do in this country?—I think they work harder; that is the result of my observation.

17,687. *Mr. R. W. Cooper*: On page 7 of your proof you refer to Messrs. Schneider and another French company?—Yes.

17,688. A little higher up you refer to Messrs. Dorman, Long & Co. and Bolekow, Vaughan & Co. having taken some large area?—Yes.

17,689. And you refer to the Channel Steel Company?—Yes.

17,690. What area have they taken?—They have actually under lease, say, about 6,000 acres, and, of course, they have more under option.

17,691. As you tell us, in that Channel Steel Company both Messrs. Bolekow, Vaughan & Co. and Messrs. Dorman, Long & Co. have a large interest?—Yes, and Messrs. Bell Bros.

17,692. They are, as we know, three very powerful organisations of English ironmasters and coal masters?—Yes.

17,693. How many collieries are now actually producing coals in Kent?—Three.

17,694. They are drawing coals, are they?—One is drawing only from one shaft.

17,695. How many are there in what I may call regular working order?—Two.

17,696. And a third is drawing from one shaft?—A third is drawing from one shaft.

(The Witness withdrew.)

MR. HENRY EUSTACE MITTON, Sworn and Examined.

Précis of evidence by Mr. H. Eustace Mitton as to boring development and ancillary work carried out by Pioneer Companies in North Notts.

Henry Eustace Mitton will prove that he is a member of the Institution of Civil Engineers, and President of the Midland Counties Institution of Mining Engineers, is at the present time mining engineer for the Butterley Company, Limited, and mining adviser for the Butterley Company, Limited, and the Stanton Ironworks in connection with new coal undertakings in the North-East of Nottinghamshire.

Prior to 1905 he was Assistant General Colliery Manager to the Tredegar Iron and Coal Company, Limited, and previous to this had considerable experience in different collieries in Derbyshire.

Since taking over the management of the Butterley Company, Limited, in 1905 a considerable sum of money has been expended by this Company in proving the extension of the coalfield in the East of Nottinghamshire and in the North-East of this county.

Witness will hand in a plan,* which shows the position of certain existing collieries in the County of Nottingham and boreholes which have been put

down in the North-East of this County for the purpose of proving the extension of the coalfield as stated above.

The areas upon which money has been expended by the Butterley Company, Limited, and by the Stanton Ironworks Company, Limited, lie to the East of the colliery marked Rufford on the plan, and are known as Farnsfield, Bilsthorpe, Ollerton and Retford areas. Each of these areas represent approximately about 6,000 acres of coal, with the exception of the Retford area, which represents about 9,000 acres.

In proving these areas various sums have been spent and the result of the boreholes has proved varying conditions existing with regard to the coalfield.

At Farnsfield it will be seen that three boreholes were put down by the Butterley Company, and a sum of many thousands of pounds was expended in this undertaking, and the result has proved that the coal is a very thin character and does not warrant the huge expenditure necessary for the development of a mine in this district.

At Ollerton, where a joint boring was put down by the Butterley Company, Limited, and the Stanton Ironworks Company, Limited, a sum of between

* See Appendix.

14 May, 1919.]

MR. HENRY EUSTACE MITTON.

[Continued.]

£5,000 and £6,000 was expended, and a workable seam of coal proved between 1,400 and 1,500 feet. The question of developing this area is at the present moment under consideration, and is the subject of negotiation with the Government on the question of expending a large amount of capital with no definite assurance as to the future of the coal industry.

At Retford the Butterley Company have expended some thousands of pounds in boring in this area. The work is in progress.

At Thurgarton a borehole was put down by private subscription some years ago, and from the records, as published in the Geological Memoirs, no workable seam was proved after the expending of many thousands of pounds.

At Oxtou, as shown on the plan, a borehole was put down some years ago by the late Sir Charles Seely, and after spending some thousands of pounds a seam was proved, as shown in the Geological Memoirs, of about four feet thick.

The proving of the North-Eastern Coalfield of Nottinghamshire, as shown by the plan handed in, is a repetition of what is now being done, and what has been done, in the Yorkshire Coalfield and in Kent, where thousands of acres which were considered to be land with only surface value have revealed underlying the surface rich deposits in minerals which have proved to be of great benefit to the nation.

The exploration and proving of the coal areas in this country depend largely on the energy and the willingness of public companies and private individuals to lay out capital to provide means for the proving of the area, and in many cases, as shown by the past borings, the sum so laid out has failed to reveal any minerals which would warrant further expending of money, and the Company or private individual who has risked his money in the enterprise loses his capital and receives no reward.

In the case of the private individual it is customary either for him to undertake the proving and exploitation of the Coalfield on his own initiative, or to join with other persons in forming a small company, and then to approach the land owners in the district and offer to prove the estates owned by them on agreed terms as to the working of the minerals afterwards if the proving shows that they are of sufficient value to warrant the outlay of further capital. After the work of boring has been completed, then the parties who have laid out this money, if they do not intend to develop and work the area themselves, arrange for their interest which they have secured in this area to be taken up by some other party who undertakes to repay the first party the cost incurred by them in proving the borehole, and a reasonable amount afterwards as an investment on the money which they have laid out on the boring.

Various ways are adopted for paying to the prospecting party a return on their capital, and in some cases a lump sum is paid down in addition to the cost incurred by them in boring, and in other cases the First Party having made reasonable terms with the owner of the minerals for the leasing and working of the same, then the Company who wish to take up the lease and develop the property pay to the boring party by way of a Deferred Payment an amount which varies from 1d. to 1½d. per ton when the coal is ultimately wrought.

To show how risky it is to spend money in developments of this character one has only to look at the map and the annexed table, and it will be seen that although very large sums have been expended, only about one-third of the bores have been successful. It may be said that it is to the interests of the nation that the further proving of the Coalfields should be conducted by the nation itself. Witness differs entirely in this. In all the cases of the bores shown on the plan a full return has been given to the Government of the boring records. A number have already been published in the Geological Memoirs and will be published in other cases. So far as the recording of the result goes, the nation has the

full benefit of the expenditure of the money by the private party. Dr. Walcot Gibson, of the Geological Survey, in his Memoir on the Concealed Coalfields of Yorkshire and Nottinghamshire, deals at great length with the evidence afforded by the above bores, as also by the remarkable boring at Kelham; and Sir Aubrey Strahan, the Director of the Geological Survey, in his paper read before the Royal Institution of Great Britain on 17th March, 1916, on the Search for New Coalfields in England, deals at length with the results of the Kelham bore.

Witness estimates that at least 100 square miles of coal has been proved, in the sense that it has been proved for colliery purposes in the concealed coalfield in North-East Notts, as a result of the boring which has been done. This is part of the area of 1,200 square miles referred to on page 1 of Dr. Walcot Gibson's Memoir.

Witness appends a table of bores put down in this district, with an estimate of the probable cost.

The exploration and the proving of the Coalfields is a matter which is constantly before the mining engineers of the day, and many men who are acquainted with the mining conditions of the country are keenly on the look-out for fresh areas where they can advise their principals for the laying out of capital, and Witness considers that the amount paid as recompense to those who are willing to put down money in an enterprise of this character is very reasonable and that they are fully entitled to a recompense such as is stated above, and it is to the interests of the nation to encourage, as far as possible, the expending of capital in the proving and the developing of the land in this country, as instanced recently by the proving of coal in Kent, the North-East of Nottinghamshire, and South Yorkshire, as well as elsewhere in the United Kingdom.

As stated in the earlier portion of this Appendix, the area of proved coal at the date of the Report of the Royal Commission, 1915, is indicated in the plan attached thereto. The whole of the development shown in the plan handed in by Witness lies to the east of and outside the then proved coalfield.

This development and exploration work has brought into being the large collieries of Rufford and Crown Farm belonging to the Belsover Company, producing over two million tons per annum, and the extension of the Sheepbridge Company, the Staveley Company, and the Wigan Coal and Iron Company, and these of the Butterley and Stanton Companies.

The money which has been found for this work has been money from reserve funds in connection with the above Companies, or collected from outside capital, and has given employment to thousands of persons in this district.

It is true that in Derbyshire where the coal measures are exposed development work has gone on gradually within the past few years, and additional collieries have been sunk which have found employment for a large number of persons in that County, but this is more or less the normal exploration and development, whereas what has been done in North-East Notts is entirely due to the enterprise shown by the various Companies and individuals concerned.

The work of boring is a particular art of its own, and one which requires great knowledge and skill to be successfully carried out.

The site has to be selected by Mining Engineers conversant with the District, in order that known faults may be as far as possible avoided, and the ground be representative of the area to be proved.

The boring machinery wants constant attention and constant supervision by men who are able to judge when coal is reached, so that an accurate record can be obtained of the thickness of the seam.

It is only on rare occasions that a core of the coal can be secured, and the thickness of the seam is calculated by time, and the quality of the seam by the residue collected in the core barrel.

14 May, 1919.]

MR. HENRY EUSTACE MITTON.

[Continued.]

The result of 18 boreholes put down in Nottinghamshire have given seven areas where it is fairly safe to assume a large tonnage of coal in workable seams awaits development. The other holes have proved in some cases no workable seam exists, whilst in the others the record is doubtful, and will require further proving before the expenditure is necessary for the equipment and development necessary for a Colliery undertaking.

Taking the case of the Ollerton and Bilsthorpe result, the Companies responsible for the exploration work had previously decided to develop these areas as soon as opportunity presented itself. After the Armistice the necessary arrangements were commenced, and certain machinery ordered to commence developing the same. Estimates were prepared, and

plans got out, when the question as to considering the Nationalisation of Mines presented itself.

The appointment of this Commission caused the Companies to reconsider their position, in view of the huge expenditure which the developments entailed, and operations were suspended, and are to-day in abeyance until some definite decision is arrived at with regard to the future of the mining industry of this country.

It is greatly to be deplored that work of this character has now been stopped practically over the whole of this Country at the moment when the nation has before it the enormous task of recommencing operations which have been suspended for a long period owing to the War which are so vitally necessary to open new Coalfields to take the place of those which are being exhausted in the ordinary course.

Chairman: Mr. Mitton speaks as to boring development and ancillary work carried out by pioneer companies in North Notts.

He is a member of the Institution of Civil Engineers, and President of the Midland Counties Institution of Mining Engineers, is at the present time mining engineer for the Butterley Company, Limited, and mining adviser for the Butterley Company, Limited, and the Stanton Ironworks in connection with new coal undertakings in the north-east of Nottinghamshire. Prior to 1905 he was assistant general colliery manager to the Tredegar Iron and Coal Company, Limited, and previous to this had considerable experience in different collieries in Derbyshire.

I am afraid we cannot go through all the individual instances, because the time at our disposal is so short. I will go to the top of page 3:—

“The exploration and proving of the coal areas in this country depend largely on the energy and the willingness of public companies and private individuals to lay out capital to provide means for the proving of the area, and in many cases, as shown by the past borings, the sum so laid out has failed to reveal any minerals which would warrant further expending of money, and the company or private individual who

has risked his money in the enterprise loses his capital and receives no reward.

In the case of the private individual it is customary either for him to undertake the proving and exploitation of the coalfield on his own initiative, or to join with other persons in forming a small company, and then to approach the land owners in the district and offer to prove the estates owned by them on agreed terms as to the working of the minerals afterwards if the proving shows that they are of sufficient value to warrant the outlay of further capital. After the work of boring has been completed, then the parties who have laid out this money, if they do not intend to develop and work the area themselves, arrange for their interest which they have secured in this area to be taken up by some other party who undertakes to repay the first party the cost incurred by them in proving the borehole, and a reasonable amount afterwards as an investment on the money which they have laid out on the boring.

Various ways are adopted for paying to the prospecting party a return on their capital, and in some cases a lump sum is paid down in addition to the cost incurred by them in boring, and in other cases the first party having made reasonable terms with the owner of the minerals for the leasing and working

[Continued.]

of the same, then the company who wish to take up the lease and develop the property pay to the boring party by way of a deferred payment an amount which varies from 1d. to 1½d. per ton when the coal is ultimately wrought."

That is with regard to the exploration of new areas. Now you deal with the risks of it:—

"To show how risky it is to spend money in developments of this character one has only to look at the map and the annexed table, and it will be seen that although very large sums have been expended, only about one-third of the bores have been successful."

17,697. I will read what the witness says while the Commissioners look at the table. Take the map in front of you. You say one-third has proved successful. Do you distinguish between the successful ones and the unsuccessful ones on the map?—No.

17,698. You say in your proof: "One has only to look at the map and the annexed table, and it will be seen that, although very large sums have been expended, only one-third of the bores have been successful"?—It is shown on the table at the end.

17,699. Of the 18 bores which are all set out on that table, six were good, and those are marked with an asterisk; six were doubtful, and those are marked with a dagger; four were negative, and those are marked with double daggers; and two are still in progress; so that six were good, six were doubtful, four were negative, and two were still in progress. "It may be said that it is to the interests of the nation that the further proving of the coalfields should be conducted by the nation itself. Witness differs entirely in this. In all the cases of the bores shown on the plan a full return has been given to the Government of the boring records. A number have already been published in the Geological Memoirs and will be published in other cases. So far as the recording of the result goes, the nation has the full benefit of the expenditure of the money by the private party." Is that the reason you differ from it?—No.

17,700. You say you differ from it, but you do not say why you differ from it?—No.

17,701. Perhaps you will tell us that?—Yes. The reason why I say that is that I consider that the private enterprise that is being carried out is done very much better in that way than by the State or by Government control.

17,702. I thought you were saying that in the case of these sinkings they are done at the risk of private people, but if the Government did it it would be done at the risk of the Government. You think the risk would be different?—I do.

17,703. I am sorry we have not the time to go into your instances, but there is something you want to say at the bottom of page 5:—"Taking the case of the Ollerton and Bilsborpe result, the companies responsible for the exploration work had previously decided to develop these areas as soon as opportunity presented itself. After the Armistice the necessary arrangements were commenced, and certain machinery ordered to commence developing the same. Estimates were prepared, and plans got out, when the question as to considering the nationalisation of mines presented itself. The appointment of this Commission caused the companies to reconsider their position, in view of the huge expenditure which the developments entailed, and operations were suspended, and are to-day in abeyance until some definite decision is arrived at with regard to the future of the mining industry of this country. It is greatly to be deplored that work of this character has now been stopped practically over the whole of this country at the moment when the nation has before it the enormous task of recommencing operations which have been suspended for a long period owing to the war which are so vitally necessary to open new coalfields to take the place of those which are being exhausted in the ordinary course." That is a very serious thing. Is there any chance of their going on at present?—The matter is now before the Coal Controller.

17,704. That is what I wanted you to tell me, because you know they tried to take steps to have that got over, and I hope it will be got over?—Yes.

17,705. Mr. Frank Hodges: I see you estimate in your appendix that the cost of the total borings, 18 in number, would come to £170,000?—Yes.

17,706. But only 6 of those have been marked good?—That is so.

17,707. So that in the ordinary way, as it is put in this statement, each borehole costs £10,000; therefore you have spent £60,000 of good money upon which you can expect to get a return?—Not quite that. If you look at the bottom there you will see that 6 were marked doubtful and 2 are still in progress, so that some credit ought to be given for those.

17,708. For the doubtful ones?—Yes. By "doubtful" I mean this, that in boring in certain of these areas, we did not get a satisfactory section in thickness. It does not mean, to my mind, that that area is altogether lost, but some further proving will have to be done either by working the adjoining area, so as to see how the coal is going, or putting another hole down, so that some credit ought to be given for those bores, apart from the good ones.

17,709. You want credit for the two still in progress and the six that are doubtful?—I think it is fair.

17,710. Let us see if it is fair: that amount which you have explained and on which you hope to get a return at present is £60,000—£10,000 a bore?—Yes.

17,711. You have explained the total of £170,000?—Yes.

17,712. In the ordinary way of capitalist enterprise you would expect to lose for ever that amount on the four marked "negative"?—Yes.

17,713. That would be gone for ever?—It would be part of the other good ones.

17,714. Do you mean to say that you would put it as the actual cost of the good ones?—I put it in this way: If you look at the plan you will see the area there of Farnsfield. If that area proves to be of no use at all, and the area above which we have proved at Ollerton is good, then the cost should be charged to Ollerton for proving there to find an area which was workable. You should not wipe it out altogether.

17,715. No. That is very clever. So that, as a matter of fact, you would not incur any losses if you put the total expenditure on the good borings?—If you put it all on the good borings, certainly.

17,716. Are you making a proposition to this Commission that the Commission should consider the question of compensating you for the amount expended?—No. I think I should like to state clearly the reason why I am giving evidence here. The boring company are parties who have put down capital for proving the continuation of the seams in Yorkshire and Nottinghamshire and other places in the country like Kent, and having spent this money, if there is going to be any alteration, in the taking over these mines by the nation, then that capital which has been spent on this ought to be considered in the same way as anybody else's capital is considered. Take my own company, the Butterley Company. We have spent in the east of this county a large sum of money in proving the continuation of these seams. If afterwards the mines are taken over, then that money which has been spent there, and has proved these seams to be workable, ought to be taken into consideration.

17,717. That is to say, if I understand your position aright—I do not know whether this applies to the other gentlemen who are connected with these pioneer firms—you propose that the amount of money, this £170,000, should be repaid you, and some sort of prospective profits that you would have had in the realising of the taking over by the colliery company?—No, not in all cases. In the cases which I have quoted, the companies intended to work the properties themselves. We are going to develop, so that all I should ask there is, supposing the mines were taken over, any money which we put out in this way ought to be taken into consideration, and if it was a proper

14 May, 1919.]

MR. HENRY EUSTACE MITTON.

[Continued.]

and fair sum spent, and it proved to be of value to the nation, it should be returned.

17,718. If mining was not such an attractive proposition you would involve a capitalist risk, and you really ask the State to back up your capitalist risk or to prevent you from having any financial failures?—I am only suggesting this if the mines were taken over. I am not suggesting that if they are continued to be carried on under private enterprise that they should be repaid. If they turned out a failure, then the party would take his own risk.

17,719. That is to say—and it has happened in more cases than one, I expect, with these pioneer companies—that they have provided capital which has been irretrievably lost because the enterprise in which they have embarked was not a remunerative one?—Yes.

17,720. Do you regard this mining as being so remunerative as to practically insure you a return on your capital outlay?—I should not like to say, to insure it. I know of a good deal of money that has gone in but has not come back, and I know of a good deal that has come back.

17,720a. It must be sufficient to cover this £170,000?—I have been able to get people to put up money for these propositions so that there must be some attraction.

17,721. Do you regard the area of coal unworked in this country as being in excess of that already worked?—I have not considered that. I should not like to answer that question straight off.

17,722. Supposing it is a geological certainty that there is more coal to be worked than there has been worked, and that there are concealed coalfields that were not thought of 50 years ago that are workable, do you not think it would be a proposition in the national interests that, instead of all these new coalfields being exploited from the start by the individual capitalist, they should be exploited on a larger and grander scale according to the best propositions that science can bring forward?—I consider that they are now exploited according to the best propositions that science can bring forward.

17,723. Even in the scattered and individualist way that it is proposed to develop these coalfields?—In the way that they have been developed during the last few years, I consider that it has been in the best manner, and I consider in a far better manner than it would have been conducted by the State.

17,724. That is to say, you have come to the conclusion that the development of the coalfields along the line of private capitalism leaves nothing to be desired?—I should hardly say nothing to be desired, but I am satisfied with it, looking at it in the interests of the nation.

17,725. *Sir Adam Nimmo*: You are not speaking for the Pioneer Company in the ordinary sense. Your company is an ordinary colliery undertaking?—The company which I represent is an ordinary colliery undertaking, but I have been asked to come here by the Pioneer Development Companies, because I am speaking for Nottinghamshire and the east of Nottingham, of which I have a great knowledge of their development.

17,726. But those pioneer companies are not the only companies that are doing this pioneer work?—No.

17,727. That is to say, many colliery companies in many parts of the country do this pioneer work?—Yes.

17,728. Would you say that any colliery company that is looking ahead with regard to its development would undertake this kind of work?—Certainly.

17,729. Do you know whether it is or is not the case that a number of companies keep on boring new areas all the time?—Yes, it is the case.

17,730. What they desire to do, I take it, is to keep up and increase their output, if at all possible?—Of course, the thing which is always before the mind of the mining engineer who is in charge and

responsible for a big undertaking is that he must look to the future to replace the exhausting coal in the colliery which he is controlling.

17,731. That exhaustion goes on at a rapid rate, does it not?—That is so.

17,732. And a wisely conducted company always looks ahead with a view to taking up new areas as fast as it can?—Yes. Take the case of the company I control. Since 1906 we have spent on development work and increasing our output 31 per cent. of our profit, and the result of that is this, that we have increased our output from just over one million tons per annum to over two millions, and included in that money we have the result of this development work in the east, in which we have now an interest in large areas which are waiting for development as soon as this matter can be settled by the Control.

17,733. If I put it to you that I know the case of a company that has not stopped boring for 20 years, would you say that is an exceptional case?—No, not at all exceptional.

17,734. Is not that work essentially progressive?—Yes.

17,735. Does it not keep the pulse of the industry beating strongly?—Yes, it does.

17,736. And keeps it alive?—Yes.

17,737. Taking advantage of everything that is discovered?—It keeps the owner's eye open with a view to seeing that his neighbour does not step in.

17,738. I understand you to say that private enterprise has done everything that is required in giving the country all the coal that is necessary?—Yes.

17,739. *Sir L. Chiozza Money*: I want some further information on matters of fact. Can you tell me how much capital is now employed by the existing Pioneer and Development companies?—No, I am afraid I cannot.

17,740. You do not know?—No, I do not know.

17,741. How many of these companies are there in Great Britain?—There are four, I understand, of this company which I am representing here to-day.

17,742. I mean how many boring companies are there in Great Britain?—I do not know that.

17,743. You are not speaking for all of them?—No.

17,744. Are there no collective facts with regard to them?—Not to my knowledge.

17,745. You do not know how much capital is invested in them?—No.

17,746. You do not know how many men they employ?—No.

17,747. Then may I ask, why do you think the very important matter of proving the coal of this company is sufficiently attended to by existing methods if you have not that information?—Because I know from experience that the work which has been done in this country, in my own immediate neighbourhood and other districts, has resulted in the proving of a very large area of coal which has been lying hidden and concealed, and was never known to have existed in past years.

17,748. From that you assume what you consider as satisfactory in your locality, equally obtains in other countries?—I know other districts where it has done. I know Kent.

17,749. Are you satisfied with the financial operations in Kent?—I know nothing about that.

17,750. Is there anywhere where I can obtain information as to how much capital and how many men are employed in proving the coalfields in this country. Is there any accessible information?—Not to my knowledge.

17,751. Is not that rather remarkable?—I do not think so.

17,752. *Mr. Evan Williams*: A great deal of valuable information has been obtained, I think, by this system of boring which is described here?—Very valuable.

14 May, 1919.]

MR. HENRY EUSTACE MITTON.

[Continued.]

17,753. Do you consider that the information you have obtained is worth the money you have spent on it?—Yes. I am speaking for Nottinghamshire.

17,754. I am speaking of the boreholes you have described in your proof?—Certainly.

17,755. You have obtained valuable information which is worth the money spent on it?—Yes.

17,756. Your view is, if someone else is going to reap the benefit of that, they should pay for it?—Yes.

17,757. Your company's coalfields extend over the whole area that you have been boring over?—Yes.

17,758. Is it not of very great value to know where not to sink a colliery in a known coalfield?—Certainly.

17,759. Is it not almost of as much value to know where not to sink a colliery as to know where to sink one?—I think it is most essential.

17,760. So that one of the ineffective boreholes upon which you have spent £10,000 may be worth quite as much money as where you have proved the coal?—Yes.

17,761. *Mr. Robert Smillie*: I think your position is a peculiar one: you are a colliery manager?—I am.

17,762. You are also connected with these pioneer boring people?—No, I am not connected with the pioneer boring people. I only put in my evidence here to-day with their evidence because the Butterley Company and the Stanton Company, with whom I am associated, and which I control, have done a very large amount of development work in the east, and I thought it would be of assistance to this Committee if I came and gave what knowledge I had in this matter: therefore I came under the wings of the Pioneer Company.

17,763. Is the Butterley connected with the Pioneer Boring Company?—Not in any way.

17,764. Did you not say that you were here to give evidence for the Pioneer Company?—On behalf of the Pioneer Companies, and developing work by them.

17,765. I think you have also another string to your bow. Do you not represent a landowner down in Kent?—No, I do not represent a landowner. I have the honour of holding a sort of watching brief for a gentleman who holds some land down there, to keep a weather eye on the development of minerals for him.

17,766. Will you tell us who that is?—Yes: Mr. Leslie Wright.

17,767. Has any of his ground been leased yet?—None of it has been leased, but there has been an agreement signed for taking a lease, though it has not been carried out.

17,768. Has his ground been bored?—No.

17,769. How many years is it since you suggested to us that you had some good ground? You remember meeting us in Dover?—I remember meeting you at Dover after you came back from Germany.

17,770. You were quite ready to lease that ground for mineral purposes?—I was not prepared to lease it, but I think that was the time when I was considering this lease for these people.

17,771. Are you prepared to lease that ground now for your friend?—I should have to get his instructions first. I have not asked him. I suppose he would be prepared to lease it.

17,772. It has not been bored, has it?—No.

17,773. You said, in answer to Mr. Evan Williams, that if somebody else is to reap the benefit, you would expect somebody else to pay. Is that still your answer?—I said in answer to Mr. Evan Williams if somebody else is to reap the benefit, the party who has spent the money in proving this area ought to be paid.

17,774. You say, if the State took over the mines and minerals, you would expect them to pay the Pioneer Company the money they have spent in proving the minerals?—What I should expect the State

to repay would be the proper amount expended by any party, whether he is a pioneer company or a private person, if he has proved these minerals which are of value to the nation.

17,775. Have not those minerals, up to the present time, been valuable to the owner of the soil?—Not until they were proved.

17,776. When they were proved by boring, and doubly proved by sinking, and then when the miners went down and produced the coal, they became valuable to the proprietor of the soil?—Yes.

17,777. Did you hear it said this morning by a landowner in the witness box that other people proved his land by boring, and they paid him, for allowing them to prove his land, £400 a year?—I do not remember that. They called me outside for a hit.

17,778. Do you know Mr. Plumtre?—Yes.

17,779. His statement was that he allowed people to bore the ground on his estate, and that they were paying him during the time that they were doing it?—Yes.

17,780. When they discovered coal on it, he would benefit from it by getting a lordship for it?—Yes.

17,781. Do you think he should benefit by it by getting a lordship from it without his paying money for boring it?—No, I do not think he should.

17,782. Do you think the State should? Should the State be treated in any way different from Plumtre or the Duke of Hamilton?—If it belongs to the State it belongs to the State; if it belongs to the Duke of Hamilton, it belongs to the Duke of Hamilton.

17,783. You say you do not think that the Duke of Hamilton or Plumtre should pay for that boring; why is that?—Most probably the party who owns this land would not have the money to do the boring; then he would have very little idea as to whether the coal was there or not. Our people come along and are willing to risk their money to prove the boring, and make terms, before they do that, with the party who owns the coal, that, if the coal is there, they will take a lease.

17,784. Take the land that you are interested in for the gentleman you mentioned down in Kent; supposing somebody bored that land and found there was coal in it or other valuable mineral and proved the property for your friend there, do you think that your friend would not be entitled to pay those people who really proved it?—I do not know Mr. Plumtre's lease, but I should say the way he would act would be this: he would say to a party, If you like to prove this coal, I will let you have the coal on certain terms.

17,785. Why have you the cheek to come here and say that the State, when they took over the minerals, should pay the pioneer people for having bored and proved those minerals?—Because my reason for coming here on that is, I want to show that there is a certain amount of money which has been expended in proving coal in the east of Nottinghamshire and Yorkshire and other parts of this country, and if the State takes the mines over, then these parties, who have put that money down and proved this valuable area for the nation, ought to have that taken into consideration.

17,786. You have spent £170,000 in your borings?—Yes.

17,787. £60,000 of which is well spent?—Yes.

17,788. Where it is well spent, there must be a recompense, but not for the £170,000. Supposing the State does not take it over, will the owner of the land pay that £170,000?—No.

17,789. Will the persons who have spent it lose it?—If the State does not take them over, then I take it that the persons who have proved it will go on developing. I to-day am in a position that I have had orders to start developing this large area. I have prepared the plans of houses—a huge village of 1,000 houses, and all the expenditure necessary to the equipment of the pits. I have given orders for winding engines and boilers, and now everything is held up and I have instructions from the Board of

14 May, 1919.]

MR. HENRY EUSTACE MITTON.

[Continued.]

Directors that I am not to proceed until we know where we are further.

17,790. Do you know that two of those bores were commenced in 1918?—Those two were commenced by myself. I am in control of the Butterley Company.

17,791. In 1918?—Yes.

17,792. Do you know that for 10 or 15 years there has been a very strong desire on the part of the miners of this country, and largely on the part of the general public, to nationalise the mines?—No, I did not know that that was so long ago. I am not quite aware yet that it is on the miners' side altogether that there should be nationalisation.

17,793. Do you think that all this feverish boring that has gone on now is for the purpose of letting in the State for something when it takes over the minerals?—Most certainly not.

17,794. Do you not think the State could have done this boring quite as well as it has been done by private enterprise?—I am perfectly sure that it could not; and I should like, if you will allow me, to tell you this, that now that the State can do boring in this country, it has been brought so forcibly to my mind that the way they are doing it is so absolutely different to what it has been done under my control and under the system of the mining engineer, that I am more convinced than ever it would not be satisfactory to let the State do it. I refer to the bore-hole that has been put down by the Government for oil at Coggins Park, five minutes from my office. I think it would be very useful for this Commission if they obtained from the Government the amount of money spent by the Government on the bore-holes in Derbyshire to-day, and compare the money that has been spent in proving the coalfields in the east of Nottinghamshire, to see how it works out financially. Then I should like to say with regard to this bore-hole that I refer to, we have at our office information with regard to all the strata in the locality where this bore-hole has been made; and no use has been made of that information, although I have met the Government officials of three different departments, and have come to an arrangement with regard to boring, no agreement has been signed, and they are not taking advantage of the information that is lying right at their door. When I start boring, the first thing I do is to go to the nearest party who provides the ground in that locality. I make friends with him and get from him all the information I can. All I can say is, if boring is going to be conducted by the State on the lines that it has adopted, then Heaven help the country!

17,795. I am quite willing to assist you in getting an enquiry into that point, too?—I am very glad to hear it.

17,796. You say that the State would not conduct borings as well as a private individual would; have you ever heard of a journal of a bore showing one or two seams of coal, and then, when the sinking took place it was found there was no coal there? Are you aware that the borers, used to show a journal in which coal was shown, and then no coal was seen?—I do not know a case of that kind, but it is quite easily done. I have heard about it, but I do not know of a case.

17,797. Do you know that it was possible under the old methods of boring to show a journal which was not a correct journal?—It is possible under the present method.

17,798. Even with a diamond bore?—Yes; if you tell me the thickness of the seam you want I can do it for you.

17,799. Then it is still possible to salt it?—Yes.

17,800. Surely the State could not do worse than that?—It is doing away with the initiative; it all comes to that.

17,801. Do you not see that if the State were doing their own boring the initiative or any incentive to act wrongly would be removed? It is only in the private ownership that the incentive to do wrong would be there for private gains; there would be no such thing with State boring?—I do not say for a moment that there have been false borings in this

country to a large extent; there may have been cases, but they have been exceptionally rare.

17,802. I am afraid they have not been exceptional?—Then I do not agree with you there.

17,803. *Mr. Herbert Smith*: Do you know anything about South Yorkshire? Are you prepared to give any evidence on that?—I should like if I could help you to clear up that George Dunston matter.

17,804. Would you agree that these borers and the owners are working in harmony?—No.

17,805. I have here a letter that was sent out by the Boring Company on the 25th of April from St. Helens, in which there is this said: "I should be glad to hear from you in reply precisely what you have done, as we are working in harmony with the Collieries Owners' Committee and the Miners' Owners' Committee, though, of course, our case is different from theirs." Is Mr. Brady the solicitor to the company?—Mr. Brady is the solicitor for the Yorkshire Boring Company.

17,806. You are here to give evidence on that matter?—I am here to give evidence as to boring and the development.

17,807. We have the Yorkshire plan here, and I want you to follow me along this plan. Here is the Cadeby Collicry, and along that line you get to the South Carr?—Yes.

17,808. Will you tell us when this Boring Company started to bore in South Yorkshire, which was the first bore-hole they put down?—1893.

17,809. Am I right in saying this bore-hole 13 miles from Cadeby was proved in 1893?—That is right by George Dunston.

17,810. And yet, in face of that, within that area, you have put half a dozen more bore-holes?—The Boring Company did.

17,811. Did they not enter into a bargain with the royalty owners, because this looked like being a prosperous coalfield, in terms similar to this, that the royalty owners should take £17 10s. per foot, and they should take £7 10s. per foot per ann. out of the people who would get these coals?—No, that is not it.

17,812. So that if Mr. Brady says so, that would be wrong?—I suppose so, I do not know. I will tell you what I know, and then you can ask Mr. Brady if you like what he knows. What I know is this, that in 1901 the Yorkshire Power Bill was brought before Parliament, and the whole thing depended on whether the coals continued to the east, and the mining engineers were not satisfied with the South Carr boring, which was a very doubtful boring; it was not sufficiently reliable; and in view of this matter the Yorkshire Boring Company was formed, which was composed of a few gentlemen who put up the money for further exploration work; and they put a bore-hole down at Thorn. I think that was the next bore-hole put down for the South Carr. That bore was then further increased by these bores which have gone on from time to time at various parts of the district; but the South Carr bore in 1893 was not anything sufficient to prove the coalfield. The late Sir Arthur Markham himself put down three bore-holes a little bit to the west of South Carr.

17,813. When you said it is not satisfactory, is it not a matter of fact that they found a seam of 9 ft. 4 in. thickness of Barnsley at South Carr?—I do not know the thickness; I was told by one party that the coal was divided, and by another party that it was not; but when they had got to the end of the boring at South Carr the core got very small indeed.

17,814. Did they find a Shaftern seam 960 feet deep?—I cannot remember.

17,815. You seem to forget just what I want you to remember.—It is difficult to bear all this in your mind.

17,816. What would you say if I told you that a seam of Shaftern was 960 feet deep and 4 feet thick?—I will accept it; I know that Shaftern was reached at that depth; but I do not know about 4 feet.

14 May, 1919.]

MR. HENRY EUSTACE MITTON.

[Continued.]

17,817. Do you know the Barnsley 3,185 feet deep?—Is not that the seam where it was a question whether it was divided or not? If you look at that one that was found at 3,185 at Barnsley, was it not a question whether it was divided?

17,818. No.—I thought it was; it was a very small core; I know that; it was not sufficient to warrant any further borings being carried on there.

17,819. I think you said in reply to Mr. Smillie, if the Government did not nationalise mines, you would get paid on a system which would be agreed with the Pioneer Boring Company?—The Pioneer Boring Company in the Yorkshire area would get paid what they had spent on any area; and afterwards they came to an agreement with somebody else to develop the work if they did not develop the work themselves.

17,820. Then let me ask you: is there any need for the Pioneer Company? Are not the engineers keeping their eye on this coalfield and grasping at it like ginger-bread?—I think the Pioneer Company is a very good thing for the country.

17,821. Is not everybody after this coalfield?—They were not in those days.

17,822. Are they not grasping a bit here and a bit there wherever they can?—I am not very well conversant with Yorkshire.

17,823. That is why I am asking you?—I am trying to do my best, of course, there was a very big attraction during the last few years in the Yorkshire areas, but I think the Pioneer Companies have most likely promoted that.

17,824. Am I not right in saying that in Nottinghamshire, and in Yorkshire, they have their eyes on it?—The Sheepbridge Company have gone into it, and they have at Stavely.

17,825. They have gone well into it?—We have not; I did not keep my eyes enough open, I suppose.

17,826. They have been too keen for you?—Yes, I suppose so.

17,827. *Mr. R. W. Cooper*: Do you know anything at all about the arrangements with the land owners and the Yorkshire Boring Company?—No.

(The Witness withdrew.)

(Adjourned for a short time.)

Chairman: Gentlemen, we have now finished the witnesses for the royalty owners and the boring companies. Up till now the Commission has first of all examined a number of expert economists; then we had a number of independent royalty owners; then we had the peers; then we had the royalty witnesses of Mr. Pawsey's Association and the boring companies.

We have taken altogether 47 witnesses up to date. We are now going to a different class of evidence altogether. We are going to certain Home Office official witnesses who will give their opinions with regard to safety in mines, and the health in mines. The first witness is Sir Malcolm Delevingne.

SIR MALCOLM DELEVINGNE, SWORN and Examined.

Chairman: Sir Malcolm Delevingne, Knight Commander of the Bath; Assistant Under-Secretary of State for Home Affairs, and in charge of the Department of the Home Office responsible for the safety and health in mines. I will ask the Secretary to read the *précis* of the evidence of Sir Malcolm.

Secretary:

“The Home Office, as the Department responsible under the Mines Act for the administration of the statutory provisions in regard to safety and health, is interested in the question of the control of the mines which is now under consideration by the Commission in so far as it affects the observance of those provisions and the general maintenance of safety in the mines.

Present System.

An elaborate code of regulations, contained partly in the Coal Mines Act, 1911, partly in the Regulations and Orders which have been made under the Act by the Home Office, is in force to secure the safety and health of those engaged in the coal mining industry, and is much the most elaborate industrial code in force in the country.

The keystone of this system of regulation may be said to be the responsibility of the manager of the mine.

Every mine with the exception of very small mines must be under a manager, and the manager is declared by the Act (Section 2) to be responsible for the control, management and direction of the mine.

The manager is required to exercise daily personal supervision of the mine (Section 3); he is responsible for the appointment of a sufficient number of competent officials to secure a thorough supervision of

the operations and the enforcement of the statutory requirements, and for assigning them their duties (General Regulation 35); he is required to examine the daily and other reports on the conditions of the mine made in pursuance of the Act (Section 24); he is himself immediately responsible for the discharge of a number of specified duties under the statutory regulations; and he is liable to be prosecuted if the mine is not managed in conformity with the Act (Section 101). Further, he is not only liable to be proceeded against for any default on his own part, he is also liable to be prosecuted and punished for contraventions of the regulations by any person whatsoever unless he can prove that he had taken all reasonable means by publishing and to the best of his power enforcing the regulations to prevent the contravention (Sections 75, 78 and other sections).

It will be seen from this statement that the principle on which the present system of administration is based is to concentrate on the manager the main responsibility for securing the observance of the safety precautions and enforcing the necessary discipline in the mine.

A measure of responsibility is also placed on the owner of the mine and his agent. The owner and agent as well as the manager are held responsible for offences committed by any person whatsoever against the statutory regulations, but their responsibility is limited by the provision in Section 102 of the Act. (A summary of the statutory provisions relating to the position and responsibility of the owner and agent under the Act is given in the note to that section in the official edition of the Act.) The practical effect is that if the owner or agent does not take any part in the management of the mine, makes all the necessary financial and other provision to enable the manager to carry out his duties, and the offence in question has been committed without

14 May, 1919.]

SIR MALCOLM DELEIVINGNE.

[Continued.]

his knowledge or connivance, he is not liable. It may be noted that an owner or agent may not take any part in the technical management of the mine unless he is qualified to be a manager (Section 2).

The responsibility of the manager, and of the owner and agent if they take any part in the management of the mine, is enforced by the system of inspection established under the Act. On the subject of inspection, reference may be made to the Second Report of the Royal Commission on Mines, especially pages 18 and 19.

The responsibility placed upon the manager is a heavy one, and it is necessary that he should have corresponding authority and powers. If he is to be held responsible for the acts of those employed in the mine, whether officials or workmen, he must have full powers to give the directions which he considers necessary for safety and to maintain discipline.

The necessity for such a system, in view of the special conditions under which the industry is carried on, seems hardly open to question. The industry is carried on in face of an enemy, against whom a ceaseless watch has to be maintained, and the operations are not concentrated and carried on in the light, as in a factory: the men are scattered singly or in twos and threes through the workings, often a long distance from the shaft and with no illumination except that of the miner's lamp or candle. Supervision is necessarily difficult. A careless or reckless act of a single individual working by himself in some distant part of a mine, the negligence of an official in carrying out some statutory examination, or the like, may bring disaster. In such circumstances the need of a highly trained and highly disciplined force—at any rate in the more dangerous mines—is hardly less than it is in actual warfare.

The system has been developed gradually in a succession of Acts as administrative experience grew, the last being the Act of 1911, which was passed after the whole question of safety had been thoroughly reviewed by the Royal Commission on Mines, and which came into force in July, 1912.* Besides defining more closely the responsibilities of the owner, agent and manager, the Act and the Regulations and Orders which have been issued under it have greatly extended and strengthened the requirements in regard to safety. The full effect of these changes, owing to the difficulties created by the war, is not yet apparent.

On the whole the system has worked well and has produced good results. The accident rates have steadily diminished; a high standard of management generally has been attained; in many mines the arrangements have gone much beyond the strict requirements of the Acts; many of the new provisions in the Act of 1911 are based on improvements in practice and plant which had previously been devised and introduced by private initiative on the part of owners, agents and managers.

At the same time the existing system is not perfect.

1. The manager, though nominally responsible, is the paid servant of the owner, and as such is subject to his orders. It not infrequently happens that the owner unduly interferes with or hampers the management. As already pointed out, the owner cannot legally take any part in the technical management unless he has a manager's qualifications; and if he takes any part in the management of the mine, he is responsible for any contravention of or non-compliance with the statutory regulations which may be committed in the mine; but it is often difficult to bring home that responsibility to him in court.

No objection is to be taken to the practice in the larger concerns, including possibly a number of mines, of appointing as managing director or agent a mining engineer of high qualifications who controls

the technical management of the whole concern. Under such a system a very high standard of efficiency may be and is attained. Generally speaking—though it is not by any means universally true—the larger concerns which have more capital at their disposal and can secure the best men are the best managed and have the best conditions.

2. The manager may have too much to do. Where he is responsible for the whole management of the concern, on its commercial and administrative sides as well as on the managerial side, his other duties may prevent him from exercising the constant supervision that is required to maintain a high standard of safety.

3. At present there is too little co-operation between the management and the workers in the mines in promoting safety. This is not, of course, a defect peculiar to the mining industry or its system of management. It is pretty certain, however, that no great advance in reducing the number of accidents can be effected without some change in present methods. Take, for instance, the greatest source of accidents—falls of roof and sides. The regulations now in force are the result of a long and careful inquiry by an expert Committee and are probably the best that can be devised in our present state of knowledge. It may be said also that on the whole the management do their best to give effect to them. The number of those accidents at present, however, shows no tendency to decrease. The abnormal conditions existing during the war have, of course, been a very disturbing factor, and with the return of experienced men and the restoration of normal conditions a considerable improvement is to be expected; but probably most of those with knowledge of the industry would say that the causes of these accidents being what they are, regulations cannot do more than restrict the danger. Accidents due to breaches of regulations are a small proportion of the whole. The human factor is to a great degree the determining factor, and greatly improved results might be secured if the question of safety came to be regarded, not merely as a matter of obedience to rules, irksome in many cases to management and worker alike, the reasons of which are not always understood, or as a system of discipline to be enforced, but as a matter of common interest to all, managers, officials and workers, in which all are equally concerned and for which the co-operation of all is needed and should be wholeheartedly given. A system of Joint Safety Committees such as has come into existence in America and in some works in this country has not so far been developed in the mines, but the Home Office feels strongly that if the full interest of the workers could be enlisted and the means given them of taking a real and effective part in the promotion of safety in the mines, a much higher standard of safety could be reached. The Coal Mines Act already recognises the right of the miners to a voice in the determination and supervision of the conditions under which they work by giving them a say in the settlement of the regulations of the mines (Sections 86 and 87 and Schedule II.) and the power to appoint persons to examine the mine on their behalf (Section 16).

It is not suggested, however, that "safety" should be regarded as a distinct branch of the administration of a mine which can be separated from the technical management of the mine, or that the ultimate authority and responsibility of the manager should be interfered with. The question of safety is inseparably connected with that of the technical management, and it would be disastrous to attempt to divorce them.

State Control during the War.

Under the system of State control which was instituted during the war, and is still in force, the present system of management so far as the Coal Mines Act is concerned has remained unaffected. In Defence of the Realm Regulation 9c it is expressly declared "that the possession by the Board

* The General Regulations did not come into operation until September, 1912.

14 May, 1919.]

SIR MALCOLM DELEIVINGNE.

[Continued.]

of Trade under this regulation of any coal mine shall not affect any liability of the actual owner, agent or manager of the mine under the Coal Mines Acts, 1887 to 1914, or any Act amending the same." The full responsibility for the observance of the Acts remained with the management, and the Home Office has enforced its observance against the owner, agent and manager in exactly the same way as before.

Nationalisation.

If the State became the actual owner of the mines, and worked them, the position of the manager would be radically changed. He would become a servant of the State, acting under the Minister of Mines and the superior officials of the Department, from whom he would receive directions and instructions. He would be responsible to those authorities for carrying out his duties as manager in accordance with the directions and instructions he receives, and in the case of default on his part would be dealt with, not by prosecution, but by disciplinary action. The conditions of his employment in regard to tenure of office, promotion, &c., would tend to approximate to those of other Government services. What the effect of such a change in regard to the management of mines from the point of view of safety would be is difficult to estimate, but it is obvious that his responsibility and powers would be very different from what they are at present.

The following may be suggested as some of the results which would follow the adoption of a system of State working:—

1. Some of the difficulties experienced under the present system would be diminished and would perhaps disappear. The manager would no doubt in many cases have a freer hand than he has at present under private ownership to make the best possible provision for the technical equipment of the mine and for safety. I am not at all sure that he would have less to do than he has at present. A great deal of his time would be taken up with correspondence on points which under the present system he would settle either on his own responsibility or personally with the owner or agent, and with the making of returns.

2. The average status of the mine manager's profession would no doubt be raised. The men of the lowest grade would be eliminated. On the other hand, the men of the highest grade might not be attracted to the service.

3. The status of the under-officials would also be improved and a better class of man would be attracted than is found at present in many of the mines.

4. It is possible the miners might co-operate more keenly in a system of safety committees under a system of State working than under the present system.

5. It seems doubtful, however, whether some of the drawbacks to the present system which have been suggested to the Commission in evidence would be entirely eliminated. If the general running of the mine is concentrated as at present in the hands of a manager, he will still have as his main function the production of coal, and will be judged largely by his efficient and economical management in this respect.

6. Differences of efficiency in the management of the mines will still continue to exist. They are due to differences of character, ability to manage men, technical qualifications, experience, and so forth, and the special conditions under which the industry is carried on would make it more difficult to counteract these by supervision than in some other industries.

7. The difficulty of supervision and of bringing home responsibility to the manager, officials and men for any accidents that may occur will also remain. As stated previously, accidents due to actual breaches of the regulations are a small proportion of the whole.

8. The State is not able to differentiate between individuals as a private employer can and equate responsibility and remuneration as closely to the merits of the individual. The same instructions, rules, &c.

will have to be applied all round; salaries will tend to equalise; initiative may be hampered and the personal incentive weakened. The administration of the industry will be concentrated in fewer hands, and consequently tend to become much more rigid. Managers will tend to throw responsibility on their superiors and ask for instructions.

9. Conversely, the penalty for failure or error of judgment is not the same under the State as under the private employer. It is much more difficult for the State than for a private employer to get rid of an inefficient man, and the difficulty would be increased under a system of nationalisation of mines by the fact that there would be no private coal mines at which a manager whose services were dispensed with could find employment.

10. Whether discipline would be equally maintained under a system of State working is a question on which it is difficult to form an opinion. There is no case exactly analogous. The explosives industry is perhaps the nearest, and in this industry the Government works do not appear to have had any advantage over the private works in the matter of discipline and safety. Everything will depend on the power and responsibility which are given to the manager.

On a balance of these considerations, it seems very uncertain whether nationalisation would result in any appreciable reduction of accidents.

Pit Councils.

The foregoing observations are based on the assumption that the present system of control by a single manager is maintained under a scheme of nationalisation. The actual schemes of nationalisation which have been submitted to the Commission propose important modifications of this system. Some of the schemes, while purporting to maintain the general principle of the responsibility of the manager, propose the appointment of advisory pit councils, half the representation on which would be given to representatives of the men employed in the mine. The effect of such a system would depend on the powers and functions conferred on such councils. One can see many advantages in the establishment of a body which, while not interfering with the manager's responsibility for the control of the mine, would provide a means by which the views and suggestions of the men could be obtained by or brought before the management. Such a system would be similar to the Safety Committees already referred to, though the functions of the council would be more extensive. Other schemes that have been submitted propose to place the manager under the general control of the Pit Council. Under these schemes individual responsibility would disappear and a collective responsibility, which could not be enforced, would be substituted. It would be much the same thing as running a regiment by a committee of soldiers and officers. I cannot imagine anything more disastrous for the safety of the mines."

17,828. *Mr. Arthur Balfour:* I take it the provisions of the Act of 1911 are adequate to-day?—On the whole, yes. In some details they are capable of amendment.

17,829. Do you think there ought to be some arrangement for having a Committee or a Commission which would look into the question of safety of mines, say, every five years and to examine and see if the improvements of the last Act had been carried out and whether anything more could be done?—I think it is very desirable to review from time to time the position with regard to safety.

17,830. Do you think it would be advisable, whether coal mines are nationalised or not, to have some permanent Department of the State or a Commission to look after the coal mining industry as a whole?—That is the function of the Home Office at present.

17,831. It is rather divided; you only look after it as regards safety?—Yes.

17,832. You do not supervise the industry in any other way except safety in carrying out the safety Act?—Those are the only functions, except the war

14 May, 1919.]

SIR MALCOLM DELEIVINGNE.

functions, the State has at present with regard to coal mines.

17,833. You think some inspection of the State Department might be advisable whether the mines are nationalised or not?—From the point of view of safety.

17,834. Where the State could see if the industry was being developed?—That is hardly a question on which I can give an answer.

17,835. On page 2 of your *précis* you refer to the question of salaries of the officials. I take it all Government salaries are published and are available to the public?—Yes.

17,836. It is absolutely necessary if everybody becomes a State employee that the salaries would be stereotyped?—Yes, it is almost inevitable that there must be a certain grading into classes.

17,837. Otherwise there will be jealousies and difficulty arises?—The point is you cannot equate the salary to a particular individual in the same way as a private employer can.

17,838. Do you think it would be too great a jump to jump from our present system to nationalisation without some intermediate experience?—You mean from the point of view of safety?

17,839. From the point of view of safety, in the first instance?—I do not think I can say. It would be a very big jump, of course.

17,840. On the whole, you think no change is necessary?—I do not say that. One's answer would depend so largely on the kind of scheme that was proposed.

17,841. You have not seen any scheme for nationalisation yet with details from the point of view of safety?—I do not think I have seen any scheme sufficiently worked out in detail yet.

17,842. You think it is very important in any case of nationalisation that the details should be thoroughly worked out and understood?—I think it is very important from the point of view of safety.

17,843. But you can see the importance of details as regards safety?—Yes.

17,844. *Mr. R. W. Cooper*: With regard to what you say at the bottom of the second column of the fifth page of your proof, where you refer to the fact that some of the larger colliery concerns are under the management of technical engineers who have qualifications, you speak approvingly of that system. I do not know if you have any knowledge yourself of the sort of salary which a man of the kind you describe there commands?—No official knowledge.

17,845. When you say you have no official knowledge, have you any private knowledge?—One hears at times of cases.

17,846. From what you have heard or know, is the scale of salaries commanded by men of that description in excess of anything they would command if placed under the State?—I should think it would be in excess.

17,847. Then from page 4, paragraph 2, of your proof, I gather that your experience and observation leads you to the conclusion that a sharp line ought to be drawn between what I may call the Commercial Department of the colliery concern and the Technical Department. In other words, the man responsible for the technical management of the mine ought not to be encumbered with any commercial or general duties at all?—I have not suggested that.

17,848. You do not suggest that?—No.

17,849. In paragraph 5 you offer suggestions. You have discussed the effect of nationalisation. You say: "If the general running of the mine is concentrated as at present in the hands of a manager, he will still have as his main function the production of coal, and will be judged largely by his efficient and economical management in this respect." I suppose there you are looking entirely to what I may call the technical management of the mine, the production of coal itself?—Yes.

17,850. And nothing to do with the disposal of the coal?—Yes.

17,851. Of course, by the efficient and economical management of the mine, you mean technically and from the point of view of working cost; that is to say, both technically and financially the economical management of the mine?—Yes.

17,852. I gather you are very strongly of opinion that nothing should be done to impair or weaken the power and responsibility of the manager?—Yes.

17,853. And any function of any committee, though they may be desirable committees, and I do not say they are not, should be of an advisory character only?—Yes, I contemplate the committee undertaking investigations and inquiries.

17,854. And getting full information?—Yes.

17,855. No power of control in any way or hindering the pits or the responsibility of the manager?—That is my view.

17,856. *Mr. Evan Williams*: There is one point on your proof in the second column, where you say: "Many of the new provisions in the Act of 1911 are based on improvements in practice and plant which had previously been devised and introduced." Were there any of the provisions that were based upon something that had not been introduced by some coal company or other, or some mining engineer?—Yes. I think I could point to certain provisions which were not based on previous practice.

17,857. What is there that evolved out of the brain of the Home Office?—Out of the brain of the expert advisers of the Home Office, I should say.

17,858. Can you point to anything introduced in the Act that had not been in practice in some mine or other in the country?—I shall have to look into that before I give an answer.

17,859. When you say "many," you do not wish us to draw the conclusion there were a considerable number of them not in practice?—The Act was based on the investigations made by the Royal Commission on Mines. I have not checked each recommendation of the Royal Commission to see if it corresponds with something existing previously in the mines.

Chairman: Will you look at Section 36, sub-section 3 of the Act of 1911?

17,860. *Mr. Evan Williams*: "Every part of the mine in which ten or more persons are employed at the same time shall be provided with at least two ways affording means of egress to the surface, and so arranged that, in the event of either becoming impassable at any point, the other will afford means of egress to the surface." I take it that the majority of the mines in the country, or practically all, had two means of egress from working places where ten or more persons are employed?—We came across places where they had not.

17,861. This was in practice in the majority of mines in the country before it was introduced by Act of Parliament?—Yes.

17,862. I suggest to you there is nothing in the Act that was not actually in practice in some manner or other in the country before?—I daresay that is so, generally speaking.

17,863. The progress of the industry really in the direction of safety has been the result of the personal initiative of the mine managers at some mines or other in the country?—Yes, but one swallow does not make a summer.

17,864. That is quite true. Your endeavour at the Home Office has been bringing up the laggards, not as far as the position of advancement is afforded, but to an average position of general safety?—To the highest possible point of safety we could reach.

17,865. There have been cases where important research work has been done by the coal owners themselves?—Yes.

17,866. Take the case of the explosibility of coal dust?—That is so.

17,867. And the prevention of the danger?—Yes.

17,868. The coal owners in that case provided a large sum of money and made researches themselves?—Yes, they did.

17,869. In the case of rescue stations, there were rescue stations before the Home Office began to interfere?—Yes, one or two, I think there were.

17,870. There were a large number before the Act was passed?—A number, but by that time the Home Office had taken the matter up with the coal owners.

17,871. The Home Office certainly made suggestions to the coal owners?—Yes.

17,872. Which have been acted on?—I cannot remember in how many instances, but they have been acted upon.

14 May, 1919.]

SIR MALCOLM DELEIVINGNE.

[Continued.]

17,873. Take it from us that practically all the stations in South Wales had been established or had their plans prepared before they were made compulsory by Act of Parliament?—I should rather like to verify that. It is not my recollection. I would not like to say without verifying it.

17,874. I think you will find on investigation it was so. You say it not infrequently happens that the owners unduly interfere or hamper the managers. Have you cases of that?—Yes, cases have come to our experience at the Home Office.

17,875. How many?—I could not say.

17,876. A large number?—A considerable number in the course of years.

17,877. Have you taken action?—Certainly, when we can. So far as we have been able we have taken action, of course.

17,878. Could you give us the number of cases in which you have taken action?—Not at the moment.

17,879. You have a record?—It would mean hunting through our records for a great many years past.

17,880. Take the last five or ten years, or since the passing of the 1911 Act, if you like; have you any cases since the coming into operation of that Act?—Yes.

17,881. You have some?—Yes.

17,882. It would not be a difficult matter to get the number of these?—It would mean a very extensive inquiry.

17,883. Because they are so few and far between?—It would mean looking through the records if you want the statistics.

17,884. You do not classify the prosecutions?—It is not a question always of prosecution.

17,885. You could give the cases where you prosecuted?—Yes.

17,886. There are not cases where you have not prosecuted?—Yes, I think there are some cases.

17,887. You are not certain?—I cannot be certain without verification.

17,888. It is a matter of some importance. Could you get us the information?—I will try and get the information.

17,889. Do you mean the cases you have had are in small poor mines or in large mines?—I think they occur in both. It is in mines of moderate size that the owner usually takes a more immediate personal concern.

17,890. In the case of larger mines or groups of mines, there is a man of very high standing in charge?—Yes.

17,891. That is a system you approve of?—On the whole, yes.

17,892. You think such a system is instrumental in keeping the manager up to a higher standard?—Yes, it provides a higher standard of technical qualification.

17,893. Qualification of the manager?—It provides the higher standard in the working of the mine.

17,894. You mean they get a better class of men?—They get the best brains.

17,895. The managers have a good deal more to learn from such a man than they would learn if he was not there?—Yes.

17,896. Or from a Government official?—I think it is fair to say so, certainly.

17,897. Assuming some sort of central body was set up with or without nationalisation to exercise some control over the industry, would you recommend that that should be a branch of the Home Office or a separate Ministry?—Will you please repeat that question?

17,898. Assuming some sort of central organisation exercising some sort of control over the Ministry on its productive side was set up, would you favour that organisation belonging to the Home Office or would you recommend it should be a separate Ministry altogether?—It would very largely depend on the extent of control. If only a measure of control on the same lines and for the same purposes as our present control, I should prefer to see it in the Home Office. If

an entirely different system of control, a separate department might have to be constituted.

17,899. You mean if it extended beyond the present limits of the Home Office's powers you would recommend a separate establishment?—I have not formed an opinion as to that.

17,900. I thought you had. Your opinion would be very valuable, I think. What do you say has been the effect of the 1911 Act, up to the present time, upon the safety of mines?—A very great improvement has taken place in the equipment and safety arrangements in the mines.

17,901. Judged by the number of accidents, what would you say the effect would be?—As I point out in my *précis*, the number of accidents has not shown any decrease, or any marked decrease.

17,902. The result has been, you say, an improvement in the technical equipment, but without any improvement in the real safety of the mine?—Yes. Of course, the full effect, as I point out, of the Act has not so far been developed. The general code of regulations under the Act only came into force in the September before the war, and a great deal of the research work being carried out under that Act was not completed before the commencement of the war on such matters as stone dusting, spontaneous combustion and other matters. The regulations have not yet been made. Then the conditions during the war were entirely abnormal. Experienced men were withdrawn in large numbers for the Army, and their places were taken by men of less experience. There were other disturbing factors, such as shortage of material for the equipment of the collieries and so forth. The war experience has thrown the machinery entirely out of gear, as it were. You cannot draw any conclusions at present as to the Act of 1911 and the regulations and orders made under it.

17,903. Although the Act itself has been in operation practically seven years and the regulations for nearly six years, the war has upset things?—Yes.

17,904. With regard to the accidents that take place and are investigated, can you tell us what number are due to breaches of regulations by the manager or some other official of the mine? Have you any record of the accidents due to breaches of the Act or regulations on the part of the officials?—No, I do not think we can give any definite figures.

17,905. Would they be many?—Our experience is that the accidents you can definitely prove to be due to breaches of the regulations are a comparatively small proportion; that includes breaches of the regulations by anybody—by officials or by workers.

17,906. In case of breaches by officials a prosecution is instituted by the Home Office?—Yes.

17,907. In the case of breaches by the men the prosecution is instituted by the management?—Usually.

17,908. There is nothing in the Act that makes it obligatory on the workman to make use of any of the safety appliances?—He is required to conform to the directions of the management.

17,909. In general terms in that way?—Yes.

17,910. Take for instance the man-holes on the roadway, there is an obligation on the management to make man-holes at certain distances?—Yes.

17,911. That is an obligation which can be enforced by law?—Yes.

17,912. There is no obligation on the workmen to make use of the man-holes if provided?—There is no provision so far as I know. I think you are right. There is no provision compelling the workman to use a man-hole.

17,913. Section 101 of the Act says: "Every person employed in or about a mine, other than an owner, agent, or manager, who is guilty of any act or omission which in the case of an owner, agent or manager would be an offence against this Act, shall be deemed to be guilty of an offence against this Act." That does not cover the instance I gave you of the man-holes generally with regard to the other safety provisions for the establishment of which there is an obligation on the management there is no obligation on the workman to make use of them,

14 May, 1919.]

SIR MALCOLM DELEVINGNE.

[Continued.]

other than he will comply generally?—There is No. 28 of the General Regulations which says: “No person employed in or about the mine shall negligently or wilfully do anything likely to endanger life or limb in the mine or negligently or wilfully omit to do anything for the safety of the mine or of the persons employed therein.”

17,914. That is in general terms, as I said?—It must be in general terms, of course.

17,915. Is there any penalty provided?—Yes, there is a penalty provided with regard to that. For a breach of the Regulations there is a penalty.

17,916. Is that section 101, sub-section 3?—The penalty for a breach of the regulations is contained in section 90.

17,917. From your experience from the statistics you have would you say that a large percentage of the accidents are due to omissions on the part of workmen to comply with the regulations as to putting up timber and as far as the working places are concerned and the making use of man-holes on the roadway and any other such cases?—I have already said I do not think our experience is that you can trace a large proportion of the accidents to breaches of the regulations.

17,918. Either on the part of the managers, officials or workmen?—Yes.

17,919. They are due to natural conditions against which no regulation is provided?—It does not follow of course; all I say is we cannot trace them. There is also the intermediate class of accident which is due not to breach of regulations but to inattention, want of care. The fact is a man working in dangerous surroundings gets accustomed to danger and is not so much on the alert as strangers would be.

17,920. What class of danger are you referring to there?—It applies equally to almost any class of danger.

17,921. Gas or the state of the roof?—Yes, gas, the state of the roof or the condition of the roads.

17,922. Do you suggest either the workmen or the officials get callous as to the state of the mine?—I would not say it is callousness at all. It is the inattention which most of us experience. If we work or live for a long time in surroundings where there is a certain amount of risk we get careless.

17,923. Is not neglecting to put up timber a breach of the regulations?—Yes.

17,924. That does not come within the clause you mentioned?—Wilful neglect to comply with the timbering rules is a breach of the Act.

17,925. You mean neglect to put up a prop where wanted?—It is not a breach unless it is required by the rules.

17,926. If an official directs it to be put up and it is not put up it is a breach?—Yes.

17,927. It requires something more than laws and regulations to ensure safety in mines?—Yes, I have said so.

17,928. You suggest committees of the miners and the management might be instrumental in improving the safety of the miners?—I think so.

17,929. In getting a better spirit in regard to observance of the rules?—Introducing what I should call the safety spirit.

17,930. A safety spirit, a better *esprit de corps*?—Partly that, partly a general desire to promote safety.

17,931. And to get both workmen and the officials to take a greater common interest in themselves?—Yes.

17,932. For that purpose you suggest these committees should be set up?—Yes.

17,933. I gather you see no objection to committees of that kind acting in other capacities than from the pure safety point of view such as consultative purposes by the management and for the purpose of imparting information, and generally to get a more interested feeling on the part of the workmen in the working of the mines?—I think that might be very desirable.

17,934. You are emphatic with regard to any functions they may possess stopping absolutely short of any interference with the management of any executive power at all?—In so far as it affects the question of safety, yes.

17,935. Or of the technical management?—In so far as it affects the question of safety. I am only concerned in the question of safety and health provisions.

17,936. You say the technical management and safety management cannot be dissociated?—Yes, I do.

17,937. Any machinery of that kind for promoting safety would have to be confined to the particular colliery. You would not suggest there should be any interference on the part of any outside body with regard to the safety of a particular mine other than this committee and the Inspector of Mines?—I have not suggested it.

17,938. I am putting it to you to get your opinion upon it?—What is the suggestion?

17,939. You suggest the committees for promoting safety at collieries. Would you confine committees of that kind to the particular colliery itself or would you allow a district committee to have any jurisdiction on the question of safety of individual collieries?—I think a consultative committee of the owners and men in any particular district would be a very great advantage. I am not suggesting any committee with jurisdiction in the sense of power to give directions. The committee I suggest would be advisory or consultative.

17,940. Nor can I?—You used the word “Jurisdiction.” A consultative committee composed of the representatives of the owners and men in a particular district for the purpose of consultation on questions of safety might be of very great advantage.

17,941. On general questions of safety?—Yes.

17,942. You would confine their powers within the limits you suggest? You would prohibit any interference with the responsibility in the discretion of the manager with regard to the safety of the colliery?—I do not quite follow your question.

17,943. You would set up committees for the purpose of promoting safety, but you say the responsibility of the manager must remain unimpaired?—Yes.

17,944. Therefore his discretion must remain uninterfered with? If he bears the whole responsibility, the determination must rest entirely with him?—What I said, of course, must be taken with the limitation that the discretion of the management must always be subject to the general rules which are laid down for the management of collieries. The discretion of the manager is not a complete discretion. He has to carry on his management in accordance with the regulations which are made by, or under, the Act of Parliament. I have not considered it—but it is conceivable that rules might be made by some sort of district committee for the general management of the working of the mines in that district with which a manager might be required to comply. I do not know if that is in your mind or not.

17,945. I was not suggesting anything of that?—Then I do not quite understand your question.

17,946. I am not suggesting the managers or anybody else should have a discretion with regard to observing the Act or Regulations or not. The method of observing the Act and the Act itself does not provide for what might be discussed. I want to get from you quite clearly, as you know, whether a Committee of this sort if set up should in your opinion have the power of interfering with the discretion of the manager so as to see how does what is wanted to be done?—The responsibility of the manager with regard to the working of this particular mine do you mean?

17,947. Yes?—I think that principle applies, certainly.

17,948. Do you expect under such management the salaries of managers would be improved at all?—I think some of the lowest salaries would disappear, certainly.

17,949. Some of the highest would come down?—Probably.

14 May, 1919.]

SIR MALCOLM DELEVINGNE.

[Continued.]

17,950. The general custom in the Civil Service is that the salaries depend upon the length of service?—No, it depends upon the grade.

17,951. Within a grade?—In most cases a scale of salaries is devised for each class or grade, so that the man would go up by steps from the minimum of his scale, on his length of service.

17,952. Do you think that a system of that kind is likely to promote efficiency in colliery management?—I do not think I can say more than I have said in my *précis* about that.

17,953. You probably put it quite clearly enough.

17,954. *Sir Adam Nimmo*: I take it you look upon the working of a colliery as a special problem by itself?—Yes.

17,955. It is not like a factory or an engine shop, where you have everything under observation, and that is why I understand you take a strong view that the responsibility for the management must be concentrated in the manager?—Yes, having regard to the special conditions of underground working.

17,956. And it must be kept there?—Yes, that is our view.

17,957. Do you think that discipline in a mine would be possible unless that principle was adopted?—No, I do not think it would.

17,958. Does not the safety depend very largely on the question of discipline?—Yes.

17,959. I notice in your *précis* you say that the safety system has been developed gradually from a series of Acts of Parliament?—Yes.

17,960. Must that not necessarily be the process in evolving any true system of safety?—I should say so. We all build on experience.

17,961. You must build on the best practice of the past?—That is so very largely.

17,962. I take it that must be the process which must be followed in the future?—I should think that is so.

17,963. And that nationalisation can make no difference in the handling of the mines from that point of view?—It will not get rid of the necessity for experience, certainly.

17,964. All you can do, starting from the present time, is to utilise experience, skill and knowledge that is available to you?—Certainly.

17,965. You would work out your system upon that basis?—Certainly.

17,966. I take it from what you say that you do not look upon British mines as being inefficiently handled. I do not know if you specially refer to the question of safety in the fourth paragraph of your *précis*?—I am only dealing with safety.

17,967. From that point of view you give the management a good character?—I think on the whole, yes.

17,968. I notice on page 2 you say that the manager may have too much to do when he is responsible for the whole management of the concern. Are there many cases of that kind?—We are not infrequently told so by managers.

17,969. Is not the rule in the country the manager is tied down to the management of the mine?—You mean he has no commercial or administrative duties?

17,970. I want to arrive at this. Looking at the country as a whole, surely it is not the position that the manager of the mine has to concern himself with duties outside the mine?—You mean outside the technical management?

17,971. Taking the practice as a whole, there may be one or two instances, but is not the manager's time and operations tied to the working of his mine?—I can only say our experience has been that we do not infrequently get this statement made to us by managers.

17,972. Will you say not infrequently?—Yes.

17,973. I should have thought it was a very rare occurrence. Referring to the fact that the number of accidents has not materially decreased during, say, the last ten years, may that not be due to some extent to this, that we are working deeper mines to-day?—Yes, I believe that is so.

17,974. That is to say, we are increasingly running into more hazardous positions?—Yes.

17,975. Where the chances of accidents are necessarily greater?—Yes.

17,976. That requires to be taken into account?—Certainly.

17,977. In dealing with any statement in regard to the number of accidents?—I believe that certainly is so.

17,978. I think you take the view that it would be a very good thing to educate the men generally with regard to questions of safety. You are aware, are you not, that in connection with the recent Education Acts that have been passed provision is made for continuation classes?—Yes.

17,979. Do not you think it would be a very good thing if these classes were used to disseminate information and knowledge with regard to safety in mines in mining districts?—I think that might be a very good use.

17,980. Would it not be very desirable to try and give as much teaching in that direction as possible?—I am not sure that I would confine the continuation classes to the teaching of safety.

17,981. It would be one of a number of questions that would interest the mining population?—I am not an expert on education.

17,982. *Mr. R. H. Tawney*: In the employers' time or in the boys' time?—The employer may be required to allow time for continuation classes.

Sir Adam Nimmo: The continuation classes have to be outside the employers' time.

Mr. R. H. Tawney: There is nothing to prevent the employers having classes in their own time.

17,983. *Sir Adam Nimmo*: I suggest the Act of Parliament passed recently should be used for the purpose of imparting useful knowledge to the industry in mining districts?—I think it might be so. I speak without experience on educational matters.

17,984. You speak of the Joint Safety Committees established in America. Can you give us information about those?—I can supply information if the Commission wishes to have it.

17,985. Can you give us references to any American Reports upon them?—Certainly.

17,986. It might be desirable we should have that information, if it is available.

Chairman: We should like to see that.

17,987. *Sir Adam Nimmo*: Most people would agree there would be a valuable place for these Safety Committees. I want to get your view upon this. I take it that you put the manager in this position: that he merely received either the report or advice from his Committee. Assuming he turned down the advice he received, what would be the position? Would it not rather create an embarrassing effect towards the manager?—That would depend upon the spirit in which this Committee was worked. A Safety Committee is not going to be very much good unless worked in the spirit of co-operation on both sides. If the manager, in his judgment and with his superior knowledge and experience, decided a particular recommendation was undesirable or was impracticable, I think the Safety Committee would take that in the spirit in which the decision was reached.

17,988. I want your view quite clearly on the point here. Do you suggest that this Committee should be advisory or consultative? Do you distinguish between an Advisory Committee and a Consultative Committee?—I was not distinguishing, no.

17,989. Is not there really a difference?—Supposing the Committee was a Consultative Committee, does it not mean the manager is bound to consult the Committee?—No, I do not think it means he is bound to consult the Committee.

17,990. If the Committee is an Advisory Committee, would it not be the Committee would come to the manager with advice, and he would either reject it or act upon it, as he thought fit?—The way these Committees act when they have been established and the way we suggest they should act would be something like this. A Safety Committee would be appointed consisting of representatives of the management, the officials and the workers; they would investigate all accidents which happened in the mine;

14 May, 1919.]

SIR MALCOLM DELEIVINGNE.

[Continued.]

they would consider the report made by the investigators of the accident; they would consider how far it was possible to prevent such accidents in future; they would consult on the subject, and, if they reached a recommendation or decision that could be submitted to the management, it would be done. Apart from that, they would also usefully, we think, undertake periodically examinations of the mines and of the plant and methods of working from the point of view of safety, and report on the condition for the consideration of the management.

17,991. You are thinking of a committee, I take it, in which the spirit of co-operation would be in evidence?—Yes, I am thinking of a committee with definite duties and which is not merely applied to casually from time to time by the manager, but should have a real function in connection with the working of the mine.

17,992. When an accident takes place?—Yes, or independently of an accident. They should take part in the supervision and watching the conditions of the mine from the point of view of safety.

17,993. In anticipation of accidents with a view to preventing them?—Yes.

17,994. When you come to the question of nationalisation, I observe you say that where a manager under State control and management was in default, he would be dealt with by disciplinary action and not by prosecution. Have you not a stronger hold over the manager just now than you would have under that principle?—Yes, I say so.

17,995-6. And where all are servants of the State, would criticism not be likely to be relaxed?—When I say that, I suggest that is a possible result. It is extremely difficult to say what would be the actual result.

17,997. There certainly would be a change in the attitudes of the parties directly concerned?—Certainly. That is the point of the observation I made in my *précis*.

17,998. Do not you think, on the whole, in view of the change of relationship, there would not be the same disposition to criticise?—On whose part?

17,999. By the superior, all being servants of the State?—I do not think that necessarily follows by any means.

18,000. It may not necessarily follow, but do not you think that tendency would develop?—I am not sure that would be so.

18,001. You say later on, under paragraph 1, the management would no doubt in many cases have a freer hand than at present. Do you mean in regard to the spending of money?—Yes.

18,002. Do you think the manager would be allowed to spend any money he liked?—I do not suppose he would.

18,003. If State supervision was very close, definite and efficient, would not the spending of money be carefully looked into?—It ought to be.

18,004. Do you think in the long run the manager would have any freer hand than he has now?—I think he might in a number of cases.

18,005. Do you think there are cases where efficiency on the side of safety is not being secured because money is withheld by the owner?—There are such cases.

18,006. Not many?—I cannot say what proportion.

18,007. If the mines were nationalised the manager would certainly be kept busy making reports to headquarters?—I suggest he would have a good deal of that sort of thing to do.

18,008. Do you know anything about the number of reports that have to be made under the present system of control?—I have no knowledge of the number.

18,009. Are they not innumerable?—I think they are numerous.

18,010. Do they increase week by week?—I do not know.

18,011. Do you know whether there are general complaints all over the country that the thing is quite beyond all endurance?—There are complaints.

18,012. There is something in it?—That is not my concern.

18,013. Is not the tendency of Government departments to call for any number of reports on any question that arises?—It depends upon the Government department.

18,014. Taking the Coal Control Department, is it not the custom to ask for a very large number of reports where there is no co-operation in the department?—I cannot speak of the Coal Controller's Department.

18,015. That is an experience we should meet with on a much bigger scale if this vast interest was nationalised.

Mr. R. H. Tawney: Are we going to have evidence from the Coal Controller's Department about the working of that Department? Unless we are, it is not quite fair that these questions could be asked?

Chairman: We are going to call somebody from the Coal Controller.

Sir Adam Nimmo: I want to keep myself quite right. Sir Malcolm refers to the reports which would require to be handed to headquarters. I have some knowledge of one department. What I am putting forward is this: Would there not be likely to be very much increased, having regard to our existing experience, if the mines were nationalised? I think that is a most relevant question.

18,016. *Chairman*: What is the answer?—My answer is, I am not attached to the Coal Controller's Department. I cannot speak with any knowledge of what goes on there.

18,017. *Sir Adam Nimmo*: Later on you say the status of the under officials would also be improved, quite a better class of men would be attracted than is found at present in many of the mines. How are these men to be got?—The conditions of service would be made more attractive in some cases. We find, for instance, for the post of fireman the manager often finds it difficult to get the best men. The position is not sufficiently attractive. Under a system of State working I think it would probably be the case that those positions would be made more attractive, and an attempt would be made to get a better class of man. I am not speaking of the present system generally. In many cases the firemen are a very fine type of men. We do come across cases where the management finds it difficult to get the man he wants for the post.

18,018. Do not we really work up the best men to the higher positions in the mine? Is it not the fact that the men desire to better themselves? Is it not the men with ambition who work their way from the positions of miners into these positions?—There has been a good deal of evidence recently that the men will not take the position of fireman because it is not sufficiently attractive, from the point of view of wages, especially.

18,019. That may be a question that can be dealt with altogether apart from bringing the mines under State control?—It could be, of course.

18,020. It is a question of remuneration?—It could be done, of course.

18,021. I take it in No. 8, under the heading of nationalisation, what your suggestion is, that the industry would probably slow down under the system. Does it not amount to that?—What do you mean by "slow down"?

18,022. You suggest initiative and enterprise might be withdrawn. There would not be initiative behind the industry. I take it that means this industry would slow down. Is not that the inevitable conclusion to be drawn from this paragraph?—Do you mean the rate of production would be decreased?

18,023. Yes?—I cannot say.

18,024. On the part of everybody?—I cannot offer an opinion.

18,025. Take it with regard to the high official you suggest in paragraph 9 it would be more difficult to get rid of an official if inefficient under nationalisation?—Yes.

18,026. Is not the position this: If a man knew he had a safe job he would not work so well under the existing employer who has the power of dismissal in his hands?—You cannot make a general statement of that sort. You find quite as high a standard in the Government service as in the other.

14 May, 1919.]

SIR MALCOLM DELEYINGNE.

[Continued.]

18,027. I recognise that. I think we have to deal with the men on the average, that is to say the general position in a matter of this kind. What would be the effect in the mine at the mean not the rare spirits who do their work irrespective of initiative?—I cannot go further than what I have said in my *précis*.

18,028. I take it your view in regard to pit Councils is that dual control in a council of this kind would be impracticable in the sense of equal authority being established between the representatives of the management and the representatives of the men; they would be in equal authority?—You mean if the Council is given executive powers?

18,029. Yes?—Yes. I think the thing is impracticable in that way.

18,030. We are not to assume the possibility of executive authority. Assuming that an executive authority was given at all, would it not lead to the breakdown of the whole system of management?—That is what I suggest.

18,031. *Sir Arthur Duckham*: With regard to the safety regulations in this country, how do they compare with the regulations in other countries; are they more stringent?—I should not like to say without refreshing my memory. On the whole I should say our regulations are stricter and more strictly enforced.

18,032. Now a question with regard to this Government control. You answered Sir Adam with regard to a question of it being more difficult for a State than a private employer to get rid of an inefficient man. You have had difficulties, I presume, in your position with men who you cannot, if I may put it, shift or have difficulty in shifting?—That is the general experience.

18,033. With regard to the question of putting the responsibility on to one higher, that is more prevalent as you say here in Government departments than in private enterprise?—I have not sufficient knowledge of private enterprise generally to say. So far as regards this particular question I think there would be that tendency.

18,034. That would have to be strongly guarded against in any move if possible. I do not know if you consider it possible to guard against that if a move was made towards nationalisation?—I think it would be very difficult.

18,035. One other point is this. Is there not a great deal of difficulty, though we have heard of these large sums of money being wasted by the State, and I think we have heard more of it since the civil servants have been assisted by the business men, but is there not a great deal of difficulty, although you see the sums of money wasted by the State, in spending money in a Government department, there is a long rigmarole to go through?—There is difficulty in getting money for things that one wants. For urgent matters it is always possible if the case exists.

18,036. Have you heard of the Treasury ever holding up a scheme that is wanted urgently by the nation?—I think the Home Office has not had that experience very often.

18,037. The Home Office has not; I congratulate the Home Office. There is the inclination for it to be a long job if you want to start any definite national work if it has to go through the different departments; say the Finance Department of a department and then the Treasury for sanction?—You are speaking from your knowledge of the Ministry of Munitions and I from mine of the Home Office. The two are different. You are a great spending department, we are an administrative department. The department has to make its own case and satisfy the Treasury that the needs exist. Our experience is that if you do there is not usually difficulty with the Treasury.

18,038. It does not necessarily follow it exists?—No.

18,039. *Sir Allan Smith*: This opinion is your own and not in any way the official opinion of the Home Office?—These opinions are put forward as the official opinions of the Home Office.

18,040. *Sir Leo Chiozza Money*: I do not know if you have followed the evidence that has been given before the Commission. You may have noticed a great deal has been said about the incentive of private profit. Do you think that private profit-making conduces to the safety of the mines—does it make for safety?—That is rather a difficult question to answer. I do not think you can give a direct answer to such a question. Private enterprise has developed a system of working in England which on the whole is as safe as any in any country.

18,041. I am not speaking of other countries. There is no country with nationalised mines, that is to say, with a complete system?—I only meant to say private enterprise has developed the system of working within this country and it has reached a very high standard.

18,042. Has that resulted from the majority of the mine-owners adopting safety regulations, or has it resulted from the State forcing those regulations on the majority of mine-owners?—I think it is a mixture of both. I think, as I tried to point out in my *précis*, the State has done a very great deal by its legislative and administrative action. On the other hand it is only fair to say the owners have done a great deal to devise safety methods of working, to improve their methods and so on. I do not think it is possible to say how much the present safety standard is attributable to the one or the other. You will always have varieties of management, varieties of enterprise and varieties of carefulness.

18,043. I put it to you, if the manager of the mine is sometimes hampered by the owner, does not hampering affect the question of safety?—It might.

18,044. Does it?—It does in some cases.

18,045. I was very much struck with a thing of great importance, that it not infrequently happens owners unduly interfere with, or hamper, managers. You say that not infrequently happens? What kind of case have you in mind there? I do not want you to give names. Tell us the kind of case you have in mind which has led you to write those words. They are very important words?—The manager may wish to renew his plant, or a particular part of his plant, and the owner may feel difficulties at that time about spending the money or he may take a different view. I had in mind the cases which sometimes occur where we have discovered some contravention of the Act or orders, and some provision has not been made perhaps which was required to be made, and the conclusion we have been forced to in some cases has been that the owners had not made, or been slow to make, the provisions the manager required for the purpose of carrying out the Act. I ought to add this further. It very often is a matter of opinion as to whether a particular alteration in the plant or a particular provision is required for the purpose. I adhere to what I say; there have been some cases.

18,046. *Sir L. Chiozza Money*: That not infrequently happens, I think you said, for financial reasons which operated in those cases?—Yes, I suppose in some cases they would be financial reasons.

18,047. If financial reasons operate in those cases, it is not really right to say that the incentive of private profit does not make for safety in mines?—In those cases it certainly does.

18,048. Do you find that is not only true of mines, but other dangerous occupations with which the Home Office is concerned, and is it not the rule?—I should not like to say that. I think very often it is a case of the management not appreciating the necessity for precautions being taken or provision being made which the expert knowledge of the Mines or Factories Department shows to be desirable.

18,049. The whole question is as between interference by the Home Office and the direct action of a Government Department in charge of mines, and one of the most important questions we have to decide is which of these makes for safety in the mines and saves the greatest number of lives. Is it not the fact that even in the war, with regard to the factories, for example, that made T.N.T. and had to handle it, you had very great difficulty in some of

14 May, 1919.]

SIR MALCOLM DELEVINGNE.

[Continued.]

the privately-owned factories to induce the proprietors to take care of the girls in that highly-dangerous occupation? Is not that the fact?—No, I do not think, as a rule, there was any difficulty.

18,050. Was not one factory actually shut up by the Ministry of Munitions?—That I cannot say.

18,051. Was it not taken out of the hands of private proprietors, because they were so bad?—I do not remember that at the moment.

18,052. Will you take it from me that it was so?—If you say it was so, no doubt it was.

18,053. I happen to know about it. Now with regard to the next paragraph in your proof, you speak of cases in which a capable managing director or agent, a mining manager of high qualifications, who controls a number of mines, produced a high standard of efficiency. If a system were arranged in which in each mining district the best brains of the district were placed in charge of the mines of that district, do you not think that it would help you to raise the standard of all the mines in the district?—Well, I do not quite understand you. Do you mean all the mines in the district would be placed under one man?

18,054. Let us assume a suitable district is arranged with a governing body upon which you had the best brains and experience in the particular kind of mining practised in that district as to the particular seams and so forth, and a man who was well acquainted with them, and those brains were in charge of that district. Would you not get very much the same kind of result but on a larger scale, as you say in page 1, column 2, of your *précis*?—I think it would very much depend upon several things, one of which would be the size of the district.

18,055. One supposes a suitably devised district. It is not difficult to imagine it or arrange it. Would not those good brains have a better opportunity?—Within limits, the better the brains the better the management.

18,056. Would it not have very much the same effect you describe in your *précis* as in the case of the best managed colliery companies?—I am not an expert mining engineer, but I should have thought you could not extend the sphere of control very widely.

18,057. Could not your excellent man or your first-class man inculcate the practice of his district with his good ideas of management? Could not he make his brains effective over a wider area than he now does?—It might be possible, but I should rather like the Chief Inspector of Mines to speak about that. I should think there is at present a great deal of interchange of ideas and information in each district.

18,058. Do you think there is sufficient?—I cannot say. I should like the Chief Inspector of Mines to speak about that.

18,059. With regard to the next page of your *précis*, page 2, paragraph 3, you say: "There is too little co-operation between the management and the workers in the mines in promoting safety." Is it for that reason that you support the idea of an advisory pit council?—Yes. I mean an advisory pit safety committee.

18,060. Do you not think that that co-operation which you seem to favour would be secured if you had a really effective representation of the workers in the district in the management of the industry?—What do you mean by a share in the management of the industry?

18,061. Exactly what I say?—Do you mean they should take part in the management of the mine?

18,062. You say in your evidence you have looked at the schemes which have been suggested. They may vary in detail, but they have all an essential idea, namely, the co-operation of the workers and the management in the carrying on of the industry?—I am not clear what some of the schemes suggest. I notice a good deal of stress is laid on the retention or preservation of the responsibility and authority of the manager. Provided the responsibility and authority of the manager were preserved, the suggestion of an

advisory pit council, as I say in my *précis*, would have great advantages.

18,063. Could the co-operation go further and extend to the making of general regulations of the industry, for example, for its benefit?—In the framing of general regulations the men already have a voice.

18,063. Could the co-operation go further and effective if there were direct and downright action by the management in which the workers took part if they felt the industry was in effect managed by themselves in co-operation with experts and representatives of the State?—Are you referring now to a central mining council?

18,065. I am referring to the whole scheme of management as a whole and not merely to the pit councils?—Yes. I should certainly say that the men have a contribution to make which it is most desirable that they should make. Under what conditions and by what method that could be secured is a matter I am not prepared to express an opinion about, but certainly the men have a contribution to make, and they ought to be able to make it.

18,066. I think you said in reply to Mr. Evan Williams that there was very great difficulty in obtaining proof of breaches of the regulations either by the masters or the men?—It is very often difficult, owing to the circumstances of underground working, to ascertain exactly what has been the cause of an accident—whether there has been a breach of regulations, or whether the accident has been due to inattention, or purely a matter of natural causes.

18,067. Is that not because our system is an interference of regulations and it is impossible, without a great army of inspectors, to see that the regulations are observed?—It is a question of the supervision of the men.

18,068. It is not a question of the supervision of the men; it is a question of your being able to find out what was the cause of the accident. I ask you how you are able to find out the cause of the accident, with this great body of regulations which is contained in these Acts, when all you have to help you to find out whether they are carried out or not is a small body of inspectors who cannot physically inspect the mines. Is that not all you have to rely upon?

Chairman: We are going to call Mr. Walker, the Chief Inspector, who can no doubt answer the question.

Sir L. Chiozza Money: Yes; but, after all, the witness has been at the Home Office for many years.

Chairman: Yes, but he does not manage this and Mr. Walker does.

18,069. *Sir L. Chiozza Money*: Very well. I will not ask the witness further about that. At any rate you are aware, of course, that since the passing of this Act of 1911, not only during the war, but before the war, there have been very serious breaches of the Act, even in that short period?—Yes.

18,070. Like the Senghenydd disaster?—Yes.

18,071. Do you not think that that is proof that no matter how you may seek to interfere in an industry of this kind, you cannot interfere, and that interference is a bad policy?—I am afraid I do not follow that.

18,072. That interference cannot secure the results which you aim at. You lay down regulations which you know it is practically impossible for you to see carried out?—That must be taken with a considerable amount of qualification. I do not say we do not enforce our regulations, because we do, and, on the whole, the regulations are observed.

18,073. As between interference and direct action in management, is it not obviously much more difficult to secure your ends by mere interference than by taking the mines themselves and managing them as you know they ought to be managed?—I think there would be great difficulty under a system of nationalisation in preventing accidents.

18,074. I put it to you that in the first place you would no longer be confronted with what you say here: "It not infrequently happens that the owner unduly interferes with or hampers the management."

14 May, 1919.]

SIR MALCOLM DELEVINGNE.

[Continued.]

State management would not be hampered with that interference, and there would be no financial interference to hamper it?—No.

18,075. Would not that be a very much better system than by regulation?—I do not think that would have very much effect on the total number of accidents. I say that this is one of the drawbacks, but I am not putting that forward as one of the main causes of accidents in mines.

18,076. Taking the Senghenydd disaster, was that not the cause there?—Unfortunately in the Senghenydd case we lost our prosecution. It was held that, so far as the question of the removal of coal dust was concerned, no breach of the law had been committed.

18,077. A few months after that was is not necessary for all the workers of a mine to come out on strike because the regulations were not observed, and because the mine, in spite of all the many clauses of the Coal Mines Act, 1911, was in a desperately unsafe condition?—What case was that?

18,078. I forget the name of the case, but did not the men come out and ask to secure the safety of the mine?

Sir Adam Nimmo: Could we have the name of the mine?

Mr. Evan Williams: It is a frequent excuse for strikes in South Wales.

18,079. *Sir Leo Chiozza Money:* I put it to you, if I may, that it would be most unlikely to happen if a Government Department associated with the workers themselves were directly managing that mine. Is it not most unlikely that the men would have come out on strike in order to secure the safety of the mine?—It is very difficult to answer. You are not going to change entirely the character of the working of the mines by a system of State management. You would still have to depend upon the supervision by the manager and on the supervision by the officials and the carrying out of their duties by the workers.

18,080. But in the case of the Senghenydd Mine, may I remind you that you yourself had issued regulations which the management of the mine had not conformed to? Is it not perfectly clear, if that mine had been managed directly by a Government Department, that the work would have been done?—In the Senghenydd case, the High Court held the management had conformed to the regulations.

18,081. Were you satisfied with the verdict?—No, we were not.

18,082. And therefore you admit it is most unlikely that those regulations would not have been carried out in the case of Senghenydd.

Sir Adam Nimmo: Is it a fair question to ask the witness's opinion on the verdict of the Court?

Sir Leo Chiozza Money: I am quite capable of asking these questions without assistance.

18,083. It is most unlikely that the regulations would have been carried out?—I should not like to say, but the particular regulation in question was with regard to the removal of coal dust from the sides and roof of the mine. The ease of the owners was that there were very great difficulties in removing the dust from the sides and roof, and that in the circumstances of the mine it was not reasonably practicable, and the High Court decided in favour of the owners.

18,084. The Home Office did not accept that verdict. You thought and think now it could have been done?—That is our view.

18,085. Forgive me pressing you, but is it not most unlikely that if that mine had been directly managed by a State Department, with the workers in association with the management, that those regulations would not have been complied with?—I think the State would have made a great effort to carry them out. The State might not always be able to secure their carrying out.

18,086. In that case they were grossly neglected, were they not?—We considered they were neglected.

Mr. R. H. Tawney: I was going to ask you about the administrative system of the Home Office and the number of inspectors, and so on, but I understand that is to be left over.

Chairman: Yes, to Mr. Walker.

18,087. *Mr. R. H. Tawney:* (To the Witness.) I should like to ask you about one or two other points. The first is this. You say on the top of page 2 that the manager may have too much to do. Have you considered whether it would be practicable or desirable to have a special safety manager in mines who was financially independent of the firm?—Well, it was in reference to that that I made this remark at the bottom of page 2. I do not think you can divorce the safety management from the technical management of the mines. The safety depends so much upon the way in which the mine is laid out and developed, and so on.

18,088. With regard to the need of financial independence, on the part of the fireman. It is the duty of the fireman to go round the workings and see that they are safe, is it not?—Yes.

18,089. For example, to see that there is no gas about and so on?—Yes.

18,090. Do you think that these duties would be better performed if he was financially independent of the particular firm where he was working and where it was his duty to look after safety? What I have in mind is this. I make no general charge, but it has been said to me, "So-and-so was careful not to find anything wrong yesterday, because he did not want to get into trouble." I do not make a general charge, but it is a conceivable motive?—That has been stated to the Home Office, but very few cases have been brought to our notice; and when we have investigated the cases brought to our notice it has been very difficult to see whether that operated or not.

18,091. All I want to get at is, whether it is not desirable that the question of safety should be altogether separated from the economic question?—Do you mean from the question of profit?

18,092. Yes?—Well, I have tried to set out in my *précis* the considerations on both sides. I do not think I can really say more than that.

18,093. You had considered it and meant this to be a discussion of that particular question?—Yes.

18,094. Now, may I take, as an example, Senghenydd, because one of the things which strikes me—again I speak from memory—is that one of the breaches of the regulations was failure to reverse the air current?—Failure to provide means to reverse the air current.

18,095. And that was a breach of the Act which your inspectors regarded as extremely serious?—Yes.

18,096. And it occurred in spite of, at least, I think, two warnings from the Home Office?—Yes. They were providing means for reversing the ventilation, but they were dilatory in carrying it out.

18,097. Do you remember what penalty the magistrates imposed for that?—I have forgotten that.

18,098. Was not the penalty an almost ridiculously inconsiderable penalty.

Sir L. Chiozza Money: They usually are.

18,099. *Mr. R. H. Tawney:* I think I can show you the particulars of the case?—If you give me the facts I am quite willing to accept them.

18,100. It was: for failure to provide means of reversing air current, fined £10 or one month. You do not regard that as anything but a perfectly ridiculous and inadequate penalty, do you?

Sir L. Chiozza Money: It shows how the regulation works.

Witness: The maximum fine is £20.

18,101. *Mr. R. H. Tawney:* I am not trying to make any point, but I want your opinion about this: it strikes me, as an outsider, as wholly disproportionate to the crime. What do you think about it?—I should certainly not quarrel with you if you suggested it ought to be £20, which is the maximum penalty.

18,102. But there were two points: there is the penalty imposed by the magistrates and the penalty allowed by the law. I understand you agree with me as to the inadequacy of the penalty imposed by the magistrate. But with regard to the penalty allowed by the law, do you regard £20 as a reasonable penalty for an offence of that order?—There are certainly cases in which the penalty might be very much higher. Of course, the Act does

14 May, 1919.]

SIR MALCOLM DELEIVINGNE.

[Continued.]

provide in section 101 (4) that, in certain circumstances, imprisonment may be substituted for a fine, but I admit the cases in which imprisonment is imposed are very rare.

18,103. Where 439 men are blown up and killed, as in this case, it is desirable that there should be some penalty of a somewhat drastic kind?—I am speaking from memory, but I think the failure to provide, at the time of the explosion, the means of reversal had nothing to do with the accident.

18,104. I quite take that if that is your opinion?—I quite agree there might be a very much heavier penalty provided for certain classes of cases.

18,105. You suggest if the mines were nationalised and you had a manager who committed breaches of the law, you could only take administrative action against him—that is to say, presumably reduce him or dismiss him. Is it not possible for the Factories Department to prosecute the manager of a Crown factory now?—No.

18,106. Why is that so? Is it the theory that the Crown cannot proceed against itself?—I suppose it is.

18,107. Does it not seem a highly ridiculous theory? The Crown is constantly taking action with regard to itself in all other relations of life. It writes letters to itself. Why should it not take action against itself?

Chairman: Would you repeat that?

18,108. *Mr. R. H. Tawney:* The witness has said that the Factory and Workshops Department cannot prosecute the manager of a Crown factory or State factory, the theory being that the Crown cannot prosecute itself. (*To the Witness.*) Is that not the case?—Yes. One Minister of the Crown cannot take proceedings against another Minister of the Crown or its officials.

18,109. I am not a lawyer, but I suggest that that is not a reasonable theory, and that there is no reason why we should be bound by it if we nationalise the mines. Is it not extremely desirable, if these services are nationalised, that your Department should be able to prosecute an official of the Mines Department for a breach of the Act?—If the present administration of the Acts were left to the Home Office?

18,110. Yes, the Mines Regulations Act?—I am afraid in my *précis* I was assuming that the Mines Department, if created, would take over the administration of the Mines Act as well as the technical control of the mines.

18,111. That is a possible course of action, but I put it to you it is not an inevitable course of action and it is not the best course of action. Is it not desirable to discriminate between the question of administering the mines and the question of enforcing the law with regard to safety in mines?—I think it would be very difficult to separate them.

18,112. Do you really think it would be difficult to inspect a Crown factory or a Crown mine, more difficult, I mean, than to inspect a private one?—I think it would be very difficult to have one department managing the mines and taking all action that is necessary for the production of coal and the provision of plant and the carrying out the safety precautions, and having another department going on its heels to see that it does its duty.

18,113. Why is it more difficult to do that than go on the heels of the private employer and see that he does his duty?—In the case of the private employer you have a number of individual units. The Crown factories, for instance, are few in number, and they have not got the accumulation of experience and knowledge in regard to safety in factories that the factory department has, and therefore Parliament has decided that the supervision of matters of safety in a Crown factory should be undertaken by the expert department. In the case of a Mines Department, you would have the expert knowledge and experience concentrated in that department, and if you left the administration of the Mines Acts with the Home Office you would have two departments dealing with the same matter.

18,114. You say you would have two departments dealing with the same matter, but I put it to you that really you would not. You would have one department dealing with the extraction of coal and you would have another department dealing with the preservation of life and safety. Now the mere fact that in each of those departments miners are concerned is not the point. The functions are quite different. Would you not divide your administration according to the service which is rendered?—I do not agree with you. The producing department would have as one of its chief duties the pursuit of safety. It would have so to conduct its operations that the safety of all employed was safeguarded as far as possible. They would have to regard questions of safety as among the most important with which they had to deal. You could not have a producing department which did not bother its head at all about safety.

18,115. I am afraid I have not made my point clear. Perhaps the Chairman would put it in a better way.

18,116. *Chairman:* Perhaps we can clear it up. (*To the Witness.*) If the inspectors remained under the Home Office and were responsible for safety, and a manager who was under the Mines Department committed a breach of the Mines Act, would it not be feasible for the inspectors to prosecute that manager?—Well, it would depend upon the circumstances in which the manager stood—the position might be that he was carrying out the instructions of his superior official and was acting under the instructions of his department.

18,117. That might be a defence, but supposing he had not done that. Would you tell me under what jurisdiction the Director of Public Prosecutions is now acting? Is it not the Home Office?—Yes.

18,118. Supposing someone at the Treasury were to commit defalcations (it is impossible to imagine it), I suppose the Director of Public Prosecutions would have no hesitation in prosecuting the Treasury official?—I imagine not.

18,119. Why should not an inspector under the Home Office prosecute a manager under the Mines Department for not conforming to the rules of his Department? That is your point, is it not, Mr. Tawney?

Mr. R. H. Tawney: Yes, exactly.

Mr. Arthur Balfour: May we have a reply?

Witness: There would be nothing to prevent it in theory.

18,120. *Chairman:* Of course we have not started the practice, but what is the objection to it? If you have the Director of Public Prosecutions responsible under the Home Office for prosecuting people in other Departments, what is the difference between that and the case Mr. Tawney is putting?—Well, I think there is a very distinct difference, but perhaps it is difficult to put it into words. In the one case, the hypothetical case of a Treasury official, it is a question of a distinct breach of the general law. In the other case, although it might be a breach of the law, it would also be a case in which the man was working under instructions and under authority, where the Department under which he was working was responsible to see that he carried out his duties. I think theoretically it would be possible to prosecute him, but I think it would lead to very great difficulties of administration.

18,121. I quite follow that. It is a very important point. For instance, supposing it is not a question of the mines manager doing something conforming to the rules of your Department, but supposing he neglects to conform, and as the result a number of men are killed; there might be a charge of manslaughter. Is he not to be prosecuted for manslaughter?—No, I should certainly not say that.

18,122. Would you mind listening to this clause which I have before me: "Every mine shall be under one manager who shall be responsible for the control, management, direction and safety of the mine, provided always that such manager shall not be personally responsible for conforming to any order of authority imposed upon him by (blank)"—we will say the Minister of Mines for the moment. Is there any

14 May, 1919.]

SIR MALCOLM DELEIVINGNE.

[Continued.]

harm in that clause? The position is this. The manager is generally responsible, but if he has to obey superior orders, and in consequence of that there is an accident, he shall not be personally liable?—That would exculpate him in that particular case, but I think the objection I mentioned would still hold in regard to the general question: that is, that there would be great difficulties in administration if one department were to interfere with the control of another department and prosecute its officials and servants.

18,123. You see it is not a question of interfering with another Department, but interfering in the case of a man who has broken the law?—It would be an interfering with another Department if you took proceedings against its officials instead of the Department dealing with the case itself.

18,124. *Mr. R. H. Tawney*: Take a Government dockyard: Supposing a man in that dockyard commits a theft, he is presumably prosecuted in the ordinary way?—I presume so.

18,125. And also disciplinary action would be taken. Suppose he does not commit a theft, but a breach of the Factory Act or such Acts as apply to dockyards. What is to prevent his being prosecuted again and disciplinary action being taken in precisely the same manner? Why is it more difficult in the case of a breach of the Factory Acts than in a case of a breach of the mining law?—If we found a breach in the dockyard, we should call the attention of the Admiralty to the case and request that they should take the necessary action to put the matter right, and I think there would be grave public disadvantages if we followed any other system.

18,126. Are there public inconveniences if you prosecute a man for theft when he is employed in a dockyard?—That is a different matter. It would not be the Home Office who would prosecute him for theft.

18,127. It would be some Department?—It is a very difficult question to answer.

18,128. *Mr. Sidney Webb*: I want to take you a little further on the same point, because it is rather important in view of other nationalisations. Do you suggest that, whenever any industry or service is nationalised, it will then cease to be practically convenient to continue the liability to prosecution which may have existed previous to nationalisation; is that a general principle?—I think all I said was that it would be practically inconvenient if one department instituted proceedings against the officials of another department in respect of matters for which that department is responsible.

18,129. For instance, if a branch of the Home Department was transferred to a new Ministry of Mines, it would then be that department's prosecution of a branch of the same Ministry?—I am not suggesting that the Ministry of Mines, if that was established, should not have, if it considered it desirable, power to institute prosecutions against its own servants.

18,130. Then I gather your objection is to one department prosecuting another department of the same Ministry. I thought your objection would not apply if that department were in the same Ministry?—That was in answer to Mr. Tawney. The ordinary practice in Government service is that the matter would be dealt with in all cases by disciplinary action.

18,131. Take, for instance, one of the largest Government services at present, the Admiralty dockyards. I am sorry to say that in that large staff, prosecutions for dockyard thefts have been rather frequent in the year in the aggregate. Is it not the regular system that one of the Admiralty administrations institutes prosecutions against Admiralty dockyard workmen who are suspected or proved to be guilty of theft of dockyard stores? Is there any difficulty in that?—I see no difficulty at all in that, but I think that is a very different case from the class of case we are considering now.

18,132. Supposing you had a Minister of Mines who, under the Coal Mines Regulations Act, or any

similar Act which made a number of criminal offences in connection with the administration of mines, would there be any inconvenience in the Ministry of Mines taking action for the prosecution for breaches of the Act?—I do not think the department would work very smoothly if you had the headquarters of the department prosecuting its managers.

18,132A. That may be a matter of opinion, but, at any rate, that is what does happen in the dockyard cases?—I draw a distinction between the offence of dishonesty and a breach of regulations.

18,133. *Chairman*: Your probable distinction is between indictable offences and offences punishable on summary proceedings?—The offences under the Coal Mines Act are only punishable on summary proceedings.

Chairman: Mr. Sidney Webb wants to know whether you draw any distinction between those offences.

18,134. *Mr. Robert Smillie*: If the mines were nationalised, you would have the workmen, as well as the managers, servants of the Ministry of Mines. Would you for a moment think of prosecuting a minor for a breach of rules, and at the same time not prosecuting a manager? You would never carry on the mines if that is the suggestion. Would you suggest that either the Home Office or the Ministry of Mines would not prosecute a manager for the neglect to carry out the rules, and yet you could and would prosecute an ordinary workman?—I think the tendency would be for the workmen to be dealt with by disciplinary action.

18,135. *Mr. Sidney Webb*: If the railways are taken over, I believe the railway companies at the present time have a considerable prosecution department in the aggregate. Is it suggested that offences on the railways by the staff would no longer be liable to prosecution?—Do you mean the offences of dishonesty or breach of the regulations?

18,136. Both?—I have no experience of railway administration.

18,137. You have said, I think, that you do not prosecute Crown factories for breaches of the Factory Act. Do you prosecute Crown factories for breaches of the Explosives Act?—No, the Explosives Act does not apply to Crown factories.

18,138. Nor the Factory Acts?—They do.

18,139. Who prosecutes for the breaches of those?—There are no prosecutions.

18,140. That is to say, the Act creates criminal offences, and if those offences are committed in Crown factories there is at present no prosecution?—No, the procedure is to call the attention of the Government Department responsible.

18,141. It seems to me that that ought to have required an amendment of the Act of Parliament?—The Government Department is the occupier of the factory, and as such is responsible for carrying out the provisions of the Factory Act. The Home Office does not prosecute the Admiralty as such.

18,142. As a matter of fact, you do prosecute the driver of a Post Office van. The Home Office does actually institute prosecutions against the driver of a Post Office van for furious driving or for manslaughter if a child is run over?—I think the police would do that. However, I cannot say.

18,143. At any rate, it is not necessary, is it, that in nationalised service the whole liability to prosecution should drop: there is no inherent necessity for that, is there?—No, I agree; there is probably no inherent necessity for it.

18,144. May I point out what you yourself quote:—
“In Defence of the Realm Regulation 9a it is expressly declared ‘that the possession by the Board of Trade under this regulation of any coal mine shall not affect any liability of the actual owner, agent or manager of the mine under the Coal Mines Acts, 1887 to 1914, or any Act amending the same.’ The full responsibility for the observance of the Acts remained with the management, and the Home Office has enforced its observance against the owner, agent and manager in exactly the same way as before.”
Although the owner or agent or manager has to obey

14 May, 1919.]

SIR MALCOLM DELEVINGNE.

the orders of the Board of Trade?—Not with regard to safety matters.

18,145. At any rate, it is provided by that that possession by the Board of Trade shall not affect the liability?—Yes.

18,146. That could he provided, I suppose, under any nationalisation?—The Board of Trade are given no powers at all with regard to matters covered by the Coal Mines Act. The Board of Trade did not become the owners of the mines: they only entered into possession of the mines. The ownership of the mines and the responsibility remain with the owners.

18,147. You yourself say the question of safety is inseparably connected with that of the technical management. However, it is clear that a clause could be put in any Act nationalising the mines which would preserve the criminal liability?—I suppose it is possible.

18,148. With regard to the question of accidents, you say on page 1 that the accidents have steadily decreased. Then you say on page 2 that the number shows no tendency to decrease. You are referring there to a particular class of accidents—falls of roof—but it does not apply to the fatal accidents?—I am taking the experience over a long period of years in the first passage. In my remark I am simply referring to the experience of the last few years since the code of regulations was drawn up and put into force.

18,149. Are you referring to fatal accidents?—Yes, fatal.

18,150. Those are only about one in 100 of the number?—We have no statistics of the non-fatal accidents over a long period of years.

18,151. I think you have every year a statement of how many accidents there are?—It has only been the last 10 or 12 years that we have had the return of the non-fatal accidents which disabled men for more than 7 days.

18,152. Before that time you had the returns for all accidents?—Only the accidents of certain classes that require to be reported to the inspector. Those only amounted to a few thousands a year.

18,153. Then it is not possible to say that the number of accidents has diminished?—Over a long period of time you mean?

18,154. Yes. They may have diminished?—In the absence of statistics one cannot say.

18,155. Is it not a mistake to say that the accident rate has diminished?—I think I should have said the fatal accident rate has diminished; but the experience is, if the fatal accident rate diminishes, the other rate diminishes.

18,156. I do not know that that is so. On page 2 you make it as one of the imperfections of the present system that the manager is sometimes too much occupied to be fully responsible on the managerial side. You would regard it that it is best that the manager should have nothing to do with the sale of the coal?—I have not suggested that. All I meant to suggest there was that the manager should not have other work to do which would interfere with his management of the mine and the fulfilment of his duty under The Coal Mines Act. If the mine is of such a size that he can manage the whole business without any interference with his managerial duties, I should see no objection to that.

18,157. Suppose it was of a certain size, would you not think it an advantage to separate the business of the sale of the coal from the business of the producing of the coal?—When it reaches the point at which the two things cannot be combined under one man.

18,158. I want to know whether you think, when you get a mine of a thousand men, it is better that the two things should not be combined?—I would rather that you should ask the Chief Inspector about that.

18,159. You first of all suggested the advantages of joint safety committees, and then, speaking of them, you confine them to the promotion of safety, but then in the last paragraph you say: "One can see many advantages in the establishment of a body which, while not interfering with the manager's responsibility for the control of the mine, would

provide a means by which the views and suggestions of the men could be obtained by or brought before the management." Now assuming that the executive control of the manager were maintained, would you see any objection to what you call the joint safety committee being a joint committee for all purposes? You are suggesting at the end of the last paragraph that there would be advantages in what you have at first called a joint safety committee being a general pit committee, provided that the executive control was not interfered with. I am anxious not to misrepresent you?—I am not in a position to express a decided opinion, because it is a matter on which we have had no experience so far, but I think there would be very great advantages in bringing in the experience of the miners.

18,160. The Home Office reports of late, describe at great length these joint committees, and give us an example of the encouragement of the workmen to make suggestions with regard to their work or conditions of employment. It was found that many useful suggestions were received and so on, and the Home Office strongly recommends that to the consideration of the management?—That was so.

18,161. Therefore, the Home Office would have no objection to these joint committees not merely dealing with safety, but all other conditions, provided that the executive authority was not interfered with?—I think not.

18,162. You point out yourself that the safety is connected with the safety of the technical management?—Yes.

18,163. If that is true of the managers, it must also be true of the men?—Yes.

18,164. With regard to the question of the making up of returns; that surely is only a matter of the management having an adequate clerical staff. The manager does not need to make up the returns with his own hand if he has a proper number of clerks to do the work?—Some returns have to be made by the manager himself.

18,165. That is to say, they have to be signed by him?—Yes.

18,166. The manager of a business does not make up the statistical returns, although he signs them?—No; still, our experience is that we do get complaints from the management of the extra trouble given to them.

18,167. That is not incident to nationalisation; that is incident to having a system of private ownership which the State is attempting to check. You have the conflict at once. It is also incident to the fact that a proper staff has not been provided?—I think you probably would have a greater volume of correspondence and returns under a system of State management.

18,168. You say, "Difference of efficiency in the management of mines will still continue to exist." That, of course, is obvious. The mines differ and the men differ. Have you had any experience in comparative statistics of different units?—No, I have not.

18,169. I do not know whether the Mines Department at all have attempted to compare one mine with another with regard to accidents? Have you any statistical information as to which mines have the accidents? There are 160,000 accidents in 1,500 mines or about a million men. That means there is an accident to every sixth man each year. That is an average. Will it vary very considerably among the different mines? Have you at all checked the different mines?—The inspector keeps a watch on that.

18,170. Could those statistics be produced?—We could produce the statistics.

18,171. You point out that the administration of the industry would be concentrated in fewer hands under nationalisation. Is not that a little inconsistent with your desire to bring in all the million men, for what it is worth, with regard to suggestion and advice in the administration?—What I mean is, that under a system of State management you would have a certain number of district officials in charge, supervising the working of the mines in the district. That is what I mean by saying they would be concentrated in fewer hands.

14 May, 1919.]

SIR MALCOLM DELEVINONE.

[Continued.]

18,172. There would be still the same number of mine managers?—Yes.

18,173. Boards of Directors do certain functions?—Yes. You would not have a district official for each mine; you would have one for the district. You have more Boards of Directors than you would have district officials.

18,174. You were merely alluding to the fact that the district superintendents would be fewer than the Boards of Managers?—Yes.

18,175. On the other hand you would bring in the miners to a much greater extent?—Yes.

18,176. Therefore, it would hardly be in fewer hands?—The direction would be in fewer hands.

18,177. You would not suggest that the direction would tend to be more rigid?—I think it would be.

18,178. *Mr. Frank Hodges*: In paragraph 9 of your *précis* under the heading of "Nationalisation" you say: "Conversely, the penalty for failure or error of judgment is not the same under the State as under the private employer. It is much more difficult for the State than for a private employer to get rid of an inefficient man, and the difficulty would be increased under a system of nationalisation of mines." Why do you arrive at that conclusion? What basis have you for arriving at a conclusion of that rather sweeping character?—From my experience of Government administration.

18,179. Have you had cases brought to your notice where obvious inefficiency has been noticed in your department, and no one has had the courage or the will or the authority to dismiss any inefficient official?—There are cases of inefficiency in Government Departments, where the inefficiency cannot be established as so serious that it must necessarily lead to dismissal.

18,180. That is true of every case. There are colliery companies, are there not, who feel that their manager is inefficient, in a sense, but they do not dismiss him, because there has not been as it were a definite breach of his instructions or of the coal mines regulations?—I think a private employer gets rid of an employee very much more rapidly than a Government Department does. If a private employer is not satisfied with a man he tells him to go, but the Government Department does not.

18,181. You think that makes for efficiency?—That is one factor certainly.

18,182. Let me put it in this way; that if you have a class of men specially trained to be managers, and the whole industry is owned as it were, either by one employer or by the State, the fact that he knows that once he is dismissed he cannot get a job as manager again, would not tend in itself to decrease the inefficiency?—It would also make the State slow to dismiss a man.

18,183. How is that?—Because the Department would feel that it was taking a man's livelihood entirely away if it dismissed him.

18,184. Not at all—he could be put into a position for which he is more adapted. It may be an act of beneficence on the part of the State to put him into a position for which he was adapted. Under the present system, his livelihood is often taken away from him when he is on the labour market?—At the present time, there is a scarcity of managers, rather than a surplus.

18,185. If a man is characterised by his employer as inefficient, and he is dismissed, it stays with him for the rest of his life. It characterises him on the labour market?—It does not prevent him getting another job as manager.

18,186. It might?—It often might, but it does not necessarily.

18,187. I should like to ask you one question with regard to the subject of prosecutions, as this question has been raised. You are aware, are you not, that the Mines Inspector at present is the only person who can prosecute a colliery manager for a breach of the Act or of a regulation?—No, anybody can prosecute provided the consent of the Secretary of State has been obtained.

18,188. Does not that, in your experience, amount to the same thing?—It is seldom that anyone does apply to the Secretary of State.

18,189. Because everybody leaves it to the Mines Inspector to do the prosecuting?—Exactly.

18,190. A manager can prosecute a workman without consulting the Secretary of State?—That is so.

18,191. But the workman cannot institute proceedings to prosecute the manager for breaches of the regulations or of the Act?—He could if he got the consent of the Secretary of State.

18,192. That is to say, he has not a free right to enter the Court as a prosecutor because of a breach of the regulations. He has to come to the Home Office for consent, but the manager has not?—If the offence is committed by the manager personally anyone can prosecute.

18,193. As an individual, but not if it is a breach of these regulations?—What the Act says is this: "No prosecution shall be instituted against the owner, agent, manager, or under-manager of a mine for any offence not committed personally by such agent, &c., except by the Inspector with the consent in writing of the Secretary of State." If it is an offence committed by the manager personally, there is nothing to prevent the miners or anyone else proceeding against the manager.

18,194. In what way could the manager commit a personal offence in his capacity as a manager?—By not managing the mine in conformity with the Act.

18,195. The Chairman reminds me very properly that such a case would be a manager having matches in his pocket?—Yes; and more important matters than that. If the ventilation of the mine is not in accordance with the Act that is an offence for which the manager can be prosecuted.

18,196. Without the consent of the Secretary of State?—Yes.

18,197. By any workman?—Yes.

18,198. Do you know of any case on record where a workman has had that right given to him?—He has the right under the existing law.

18,199. Can you give me a case in which that has been accepted?—I know of no case where it has been done, but I think I am right in saying that in a matter of that sort it is possible for proceedings to be taken by any private person.

18,200. *The Chairman*: Might I help you. Suppose the colliery company refuses to supply him with the money to get the machinery, what happens then; is he personally liable?—He is still liable. I think so.

18,201. *Mr. R. W. Cooper*: He would be protected, would he not, under Sub-Section 3 of Section 102?—The owner or the manager?

18,202. Anyone. "Nothing in this Act shall render the owner liable if he proves that it is due to causes over which he has no control"?—Yes.

18,203. *Mr. Frank Hodges*: Has not the practice been that the manager always acts on that assumption prior to any prosecution or while the prosecution is in contemplation and that makes it indispensable for the workman to have to apply to the Secretary of State?—I am afraid I do not quite follow that question.

18,204. You make the point, I gather—and this is the first time I have ever heard it—that a workman can prosecute the manager in any mine for a breach of the Act for which he is personally responsible?—I understand that to be the law.

18,205. All I can say is that you propound a theory which has never been propounded by the Home Office before in all attempts that the workmen have made to prosecute colliery managers?—Are you quite sure of that?

Mr. Frank Hodges: Quite sure.

18,206. *Mr. R. H. Tawney*: Is it the case that under the Factory Acts the individual cotton-spinners can prosecute?—There is nothing to prevent proceedings being taken by anybody.

18,207. Can the secretary, for instance, of the Operative Spinners prosecute?—I am not quite sure how the law stands with regard to a representative person taking proceedings.

18,208. *Mr. Robert Smillie*: Has that point ever been put to you before? You say any person can prosecute a colliery manager or a colliery under-manager, or an agent of the mine, provided that he is guilty of a breach of the Act?—I am speaking rather on the spur of the moment, but I think the question has been put to us, and, if my memory serves me

14 May, 1919.]

SIR MALCOLM DELEVINGNE.

[Continued.]

rightly, that is the answer we have given, but this is a legal question, and if the Commission wishes to follow that up, I should like to look into it further.

18,209. Are you aware that the miners have again and again asked the Home Office to put them on an equal footing with the managers to give them a right to prosecute the manager, just as the manager has a right to prosecute them?—I do not think we have had any requests of that sort.

18,210. Do you know that it has been the subject, year after year, of resolutions at the Miners' Federation and deputations?—I must say I cannot recall it at the moment.

18,211. You are aware that there is a difference between the position of matters in Scotland and in England: the managers cannot prosecute the mine worker for breaches of the Act in Scotland. Are you aware of that?—It is always taken by the Fiscal.

18,212. And the Fiscal must be permitted by the Home Office to raise a prosecution?—Against the worker?

18,213. Against the manager of a mine?—Against the manager, yes.

18,214. A manager has only to convince the Procurator-Fiscal in connection with a charge against a workman, and the Procurator-Fiscal takes action?—Yes.

18,215. But the workman cannot take action against the management?—The system in Scotland is different from the system in England, as you say.

18,216. I want to put it to you that up to the present time no workman has ever taken action against the manager, because they knew they had no right to do so?—I do not know why they have not done it, but I think what you say is a fact, that they have not done so.

18,217. *Mr. Herbert Smith:* Let me give you a case. We have been working for a conviction of a manager under breach of rules. We want to take proceedings. We have had word from the Home Office that we have to get the Secretary of State's permission?—If it falls under sub-section 5 of section 102, that would be so.

18,218. *Chairman:* I think it would be the best way for Sir Malcolm to look into the cases. Would you look at the case of *Hall v. Hopwood*, in 49 Magistrates' Cases, p. 17. I think you will probably find something that will help you there? Will you look into it?—I will.

18,219. *Mr. Robert Smillie:* It was put to you by Mr. Evan Williams that there was hardly any clause put into the 1911 Act of Parliament to enforce provisions which was not already being done by the majority of colliery owners?—I did not say that.

Mr. Evan Williams: I did not say the majority—which had not already been put in operation at some colliery or other.

18,220. *Mr. Robert Smillie:* I put it to you that practically all mining legislation in the past has been for the purpose of bringing up the majority of the colliery owners to the position of the best of them?—And also beyond the best standard then obtained.

18,221. Can you tell me how many colliery owners in this country had a method by which they reversed the air current prior to the passing of this Act?—I could not.

18,222. Will you take it from me that there were not two in the country?—I am afraid I have not the information.

18,223. I suppose prior to the Act of 1887, or even 1863, there were very few collicries having two shafts?—I am afraid I cannot speak to that without making enquiries.

18,224. Did the last Act of Parliament make it compulsory that there should be detaching hooks in every mine, and in the case of a mine more than 100 yards deep detaching hooks and a conformer?—Yes.

18,225. Do you know of any mine at all in that position before the passing of the Act?—I think that is a question that the chief inspector of mines can answer better than I could.

Mr. Frank Hodges: The unfortunate thing is that Sir Malcolm gave an answer to Mr. Williams without conferring with the inspector of mines.

18,226. *Mr. Robert Smillie:* I think you are not in a position to answer these questions?—In those matters I should answer only after consultation with the chief inspector of mines. The opinion I put forward in my *précis* was after consultation with the chief inspector.

18,227. *Chairman:* When you are making that little note that you are going to make for us, if you will look at section 102, sub-section 3 of the present Mines Act, I think that will help you to come to a conclusion. I do not want you to look at it now?—I am afraid I am not quite clear as to the point you have in mind.

18,228. You are going to make a little note with regard to the matter generally, and I asked you to look at this case of *Hall v. Hopwood*, and while you are doing that will you look at section 102, sub-section 3, and let us have your opinion on that?—Do you mean as to the application of section 102, sub-section 3?

Chairman: I mean this. In order that you may be clear on the point we have in mind I should be obliged if you would look at that case, also at section 102, sub-section 3. I am very much obliged to you for the assistance you have given us.

(The Witness withdrew.)

Dr. JOHN SCOTT HALDANE, Sworn and Examined.

Chairman: I am going to ask one member on each side to ask Dr. Haldane questions. I will ask Mr. Tawney on the one side and Mr. Balfour on the other. Dr. Haldane is a Doctor of Medicine, a Fellow of the Royal Society, Fellow of New College, Oxford, and a Director of the Coalowners' Research Laboratory:—

“For the last 25 years I have been largely engaged in the investigation of questions of health and safety in mining and other occupations, and I served on the last Royal Commissions on Health and Safety in Coal and Metalliferous Mines.

Although coal-mining is associated with a number of special dangers, it entails in this country less loss of life than average occupations. The death-rate from accidents is about double the average in other occupations; but owing to the exceptionally healthy conditions the death-rate from disease is much below the average. The total death-rate is thus below the average, as shown by the following figures compiled from the last Decennial Report of the Registrar-General on Occupational Mortality:—

Death-rates from all causes per 1,000 living at each age-period.

Age period ...	15-25.	25-35.	35-45.	45-55.
All occupied and retired males.	3·5	6·3	10·9	18·7
All occupied and retired colliers.	3·8	5·1	8·0	15·2

About sixty years ago the general death-rate among coal-miners was about a third higher than in average occupations, but has since then diminished much more rapidly than in most other occupations. The accident death-rate among coal-miners has diminished to about a fourth of what it was sixty years ago.

This improvement is due, I think, partly to the better wages earned, partly to improved methods of mining, and partly to greater knowledge and skill,

14 May, 1919.]

DR. JOHN SCOTT HALDANE.

[Continued.]

better discipline, and greater loyalty to one another of those engaged in the industry. As one who has come into contact with the British coal-mining industry from outside, I should like to place on record my admiration for the men engaged in it, including those who manage it and the inspectors of mines, with some of whom I have been very closely associated. In spite of all the clashings of interest the highest qualities of our race seem to me to stand out among them at once whenever there is danger or difficulty. It is most emphatically not my experience that in the conduct of the industry, whether on the part of managers or manual workers, motives of gain interfere with regard for the safety and health of fellow men.

As regards safety and health, there is evidently plenty of room for further improvement. This depends on the advancement and dissemination of knowledge, on skill in applying it, and on individual discipline and moral qualities.

As regards the advancement of knowledge in connection with mining, I think that the organisation in this country is at present inadequate. Very valuable work is done by the Institution of Mining Engineers and the South Wales Institute in the publication and discussion of original papers; but their usefulness is considerably crippled by lack of funds. Until recently the Government has done very little in a direct way for the advancement of knowledge in relation to health and safety in mining; but as a result of the establishment of the Medical Research Committee under the Insurance Act and the Department for Scientific and Industrial Research this is being altered.

As an instance of the manner in which knowledge and practice with regard to safety in mining have been retarded by lack of organisation, I may take the prevention of colliery explosions. The late Royal Commission struggled with this subject to the best of its abilities. By far the most promising suggestion for preventing disastrous explosions was placed before the Commission by Mr. (now Sir William) Garforth, who proposed stone-dusting. To test this plan on a proper scale a considerable sum of money was needed. The Commission applied to the Treasury, but the application was refused. The consequence was that the present Mines Act is very much out of date in its complicated and burdensome provisions against explosions. Disastrous explosions still continue to occur, and are, in my opinion at least, a disgrace to the country which has produced the men who, like Professor Galloway, Sir William Atkinson, and Sir William Garforth, have patiently laid bare the causes of, and means of preventing these explosions. After the Mines Commission had failed in its efforts, the required experiments were initiated at Alftoft's Colliery by the Mining Association under Sir William Garforth's direction, and afterwards, as the Alftoft's site was too dangerous, carried forwards at Eskmeals at Government expense under a Committee presided over by Sir Henry Cunynghame of the Home Office. The more progressive mines have, to a large extent, adopted the plan of stone-dusting, as initiated by Sir William Garforth in mines under his direction; but probably the majority of mines have still done nothing but carry out the totally inadequate existing legal provisions. As a consequence, many mines are still liable to the most disastrous explosions.

To further the development of knowledge with regard to special mining problems, I think that laboratories ought to be established, under competent local direction, in the main mining districts and in connection with universities where possible. These laboratories would be in touch with the collieries, and would assist in the solution of problems of special local interest as well as those of more general importance. A scheme of this character has recently been under the consideration of the Mining Association and the Department of Scientific and Industrial Research.

The Doncaster Coal Owners' laboratory, of which I am director, was established with these objects by the late Sir Arthur Markham, on behalf of the Brodsworth and Bullcroft companies, and the late Mr.

J. W. Fryar, on behalf of Barber, Walker & Co. At present it is the only laboratory of the kind in this country. Its more immediate objects were to assist in securing the safety of the mines of the companies in question; but it has published in the transactions of the Institution of Mining Engineers and elsewhere a continuous series of papers on questions of health and safety. As an example of the subjects investigated at the laboratory I may mention the dangers associated with the use of mine-rescue apparatus. By hasty legislation the provision of such apparatus had been made compulsory at mines, without sufficient being known about the various kinds of apparatus, or the precautions absolutely required in their use.

It was the hope of the founders that other companies would become associated with this laboratory, and that similar laboratories would be established elsewhere. Unfortunately, however, the establishment of the laboratory, and the consequent initiation of stone-dusting and other measures of safety, were followed by what seemed to me a most singularly ill-advised prosecution of Mr. Fryar by the Home Office, with the result that other collieries became very shy of the laboratory.

I would point out that in the United States an important Government Department, the Bureau of Mines, devotes itself mainly to obtaining and spreading knowledge as to safety in mining. Like the Bureau of Agriculture, and other similar extremely useful and popular United States Departments, it has no executive powers. I recently visited some of its laboratories and experimental stations, with the result that I felt that we are in danger of being left behind for mere lack of organisation.

As regards the question of nationalisation of mines, I share the general British distrust of too much bureaucratic control, and I think that, so far as health and safety are concerned, it would hardly be possible to nationalise coal-mining without largely stifling initiative and the sense of individual responsibility. To colliery managers who are endeavouring to secure real safety in their mines, or inspectors who are striving after real safety in their districts, the amount of paper work thrown upon them by too detailed regulations is already far too great. Their energies are absorbed over paper safety, whereas they ought to be devoted to real safety. I have noticed with great regret the growth in recent years of a system of wooden bureaucratic control in matters of safety in mining, and it seems to me that with nationalisation this tendency would inevitably be greatly increased, to the detriment of safety and health. To give an example of this tendency, it seems to me that in inquiries as to mining accidents far too much stress is laid on whether the letter of the Mines Act has been carried out, and far too little on the real causes of the accident, and how similar accidents could be prevented in future. The safety of mining depends very little on paper regulations, but mainly on the accumulated knowledge, skill and discipline which constitute good mining. Where good mining is absent accidents will be frequent, in spite of an infinity of regulations and armies of inspectors.

As a member of the late Royal Commission on Coal Mines, I took a keen interest in the question of instituting pit-head changing houses and baths, as well as in housing, to which Mr. Smillie specially directed our attention. From personal observations at that time I can confirm Mr. Robertson's description of the very unsatisfactory housing conditions in some parts of Scotland, and the need for pit-head baths. I went round many of these houses, and discussed them and the pit-head baths question with the miners or their wives. I was disappointed to find that there was at that time an almost unanimous objection to pit-head baths. I had hoped that at any rate the wives would have favoured the baths, on account of all the work and discomfort caused by the dirty pit clothes and by providing warm water for washing. To my surprise the wives seemed more strongly against the pithead baths than the men. They feared that their husbands or sons might take harm, and seemed also to resent the idea that anyone but themselves should see after the washing and

14 May, 1919.]

DR. JOHN SCOTT HALDANE.

[Continued.]

clothes. In view of the feeling amongst the miners against pithead baths the Commission could not proceed further than recommend that they be provided by law if a majority of the miners at any colliery asked for them. It seemed to me that this was a matter which the Miners' Federation might, with great advantage, actively take up with its own members. At metalliferous mines in this country pithead changing and washing is a universal custom.

As regards the bad housing, I was also disappointed to find that, considering their apparent earnings, a very intelligent class of persons should acquiesce in living amid such overcrowding and discomfort of every kind. They said, however, that they objected to pay more than about two shillings a week for a house. It did not seem possible to provide proper houses at such a rent. Much better houses were, I was told, available near the worst of these houses at about three and sixpence, and were standing empty. It seemed to me that both in the matter of housing and in that of pithead changing and washing, most of the difficulty arose from rooted custom. In the Doncaster area the miners' houses are, to a large extent, built and owned by the mining companies, who have followed the lead given by Sir Arthur Markham in the case of the Brodsworth village. The occupants are accustomed to pay a rent corresponding to the value of a good house. The housing question was outside the terms of reference of the late Royal Commission, who passed it on to the Local Government Board. I felt, however, that this question would never be settled without more active co-operation from the miners themselves."

18,229. *Mr. R. H. Tawney*: You give some very interesting figures at the beginning of your paper as to the death-rate per thousand, and I think the inference you draw is that on the whole miners are rather above the average in the matter of health?—Yes, certainly, in the matter of health, very much above the average.

18,230. I should like to ask you one or two questions about those figures from a statistical point of view. In the first place, would it not be true to say that the mining industry is a somewhat selected industry? Let me give an example with regard to the entry into mining; would it be true to say that on the whole the stronger boys go in and the weaker ones stay out?—There is no medical selection of any sort. I should say that practically in the mining industry nearly all the boys went in unless they went right away from mining into some rather exceptional occupation.

18,231. On the other hand, the industries vary in the physical demands they make, and naturally the heavier industries tend to take the stronger boys?—That would be so in some cases, but I do not think it is usually so in the mining districts.

18,232. You know North Staffordshire?—Yes.

18,233. You know that in North Staffordshire the boys can choose, roughly, three employments. They have the choice of mining, they have the choice of railways, and they have the choice of the potteries. Would it not be true to say that on the whole the stronger boys go into mining and the weaker into the potteries?—I should not like to answer that question. I should be rather doubtful about it. There is some very trying work in the potteries.

18,234. Yes, there is. I was only putting it to you from a statistical point of view. It is relevant?—I think it depends more on their fathers and brothers.

18,235. Have you considered the proportion of miners in different age groups?—Yes; these are given in the Registrar-General's Blue Book.

18,236. You remember then that the proportion of young men among miners is much larger than in any other industry in the country. It is much larger than all the industries together. It is very much larger than some and rather larger than some others?—That may be so.

18,237. May I give you some figures to remind you? The proportion of men between 20 and 45 in the case of all trades is 58 per cent. In the case of

agriculture it is 42 per cent., in the case of miners of coal and shale working at the face it is 69 per cent.—Are these from the occupational statistics?

18,238. From the Report of the Registrar-General? Does that not suggest that there is a considerable drift out of working at the face after the age of 45?—I should put the age a little higher. If I may put it so, the number of miners has increased very rapidly, and the increase is at the lower end among the young men. Comparing them with agricultural labourers, for instance, they are not increasing at all.

18,239. What I meant was that, compared with other occupations, the proportion of young men is relatively large?—Yes, it is relatively greater.

18,240. That means that there is a certain drift out of the occupation—a drift after a certain age. Is it not fair to suggest again that that drift is probably of the men who find the life most trying—that is to say, of the weaker men?—I doubt whether there is much drift till a man gets past hard work. A miner's work is very strenuous work. He must be in first-rate physical condition.

18,241. Statistically there is this discrepancy between the mining occupation and other occupations. Would it not be true, to take your phrase, to say that miners get past the strenuous work at rather a younger age than men get past work in other occupations?—I think that is so.

18,242. That means, on the whole, that the men who get past it first are probably the less strong, and the men who go on longest are probably the stronger men?—Yes, I should think so.

18,243. Ought not your figures for sickness always to be read in connection with age distribution?—Certainly—they are so there; they are given in terms of age distribution.

18,244. What I meant was that, although you show that at different ages in the industry the proportion of miners who suffer from disease is smaller than the proportion of other males, I do not think you have taken into account the fact that the miners are a selected class, because the weaker drift out sooner?—It is a thing that ought to be considered if possible, but I see no reason to think myself that it would make any difference. I have gone very carefully into the statistics of a great many occupations.

18,245. Do not think that I am questioning the statistics, but these questions of statistical methods always arise. Although I do not profess to be a statistician, I have always had that point drummed into me by those who do, and it seems to be a relevant one?—Certainly.

18,246. We might read your figures with some qualification pending the consideration of that. Now about tuberculosis among miners: I understand that on the whole the mining occupation is an occupation which suffers to a remarkably small extent?—Certainly it does.

18,247. Does it not suffer to a remarkably large extent from diseases of the respiratory system?—I think it does. That means as miners get old. I wrote a paper on that subject two or three years ago, and I quite agree that a larger proportion of miners than of most other occupations die, say, of bronchitis.

18,248. I think the actual figures are 140 among miners and 78 among the general population, who die from diseases of the respiratory system. That ought to be taken as some set-off against the phthisis figures. They ought to be read together?—Certainly. I have discussed this thing very fully in a paper, which I do not want to trouble the Commission with. Two or three years ago I went into it very closely myself.

18,249. *Mr. Arthur Balfour*: Where can we get that paper?—It is in the transactions of the Institution of Mining Engineers.

18,250. Might we have a copy?—I have brought a copy here.

18,251. Could you let us each have a copy afterwards?—Certainly.

14 May, 1919.]

DR. JOHN SCOTT HALDANE

[Continued]

18,252. *Mr. R. H. Tawney*: We have had quoted to us several times the low phthisis rate with regard to miners, but we have not had quoted to us the fact that the rate from these other respiratory diseases is unusually high. I am not putting that as a point against you; but the two ought to be read together?—Certainly.

18,253. I was very much interested in what you said about accidents in the second column of your paper. You give an account of the progress of science in making it possible to prevent accidents, and you go on to say that "probably the majority of mines have still done nothing but carry out the totally inadequate existing legal provisions. As a consequence, many mines are still liable to the most disastrous explosions." Does that mean that in your opinion there are a good many mining accidents which could be prevented?—Most certainly.

18,254. That, of course, is an immensely momentous fact. It means that we sacrifice unnecessarily a large number of lives?—We put them at risk, and occasionally when there is a bad explosion, as that at Stoke the other day, there are a lot of men killed.

18,255. Would you elaborate that? What kind of preventative have you in mind?—Stone dusting. That is, for example, the conclusion of the Esmear Committee, which found that if you got more than half and half of shale dust on the roads along with the coal dust you cannot get an explosion from any accidental blow out shot or ignition of gas; whereas at present with the roads left in their present condition as to a great many mines the whole place is like a train of gunpowder; you get a puff of gas and the whole thing is off, as at Seughennydh, or the recent explosion near Stoke.

18,256. Does that mean, in your opinion, that mining is unnecessarily dangerous in the sense that if we used our knowledge we could make it less dangerous?—As regards explosions the existing knowledge is not properly used, certainly.

18,257. You speak of the totally inadequate legal position. Do you want the regulations tightened up?—I want them simplified and altered. If you want to prevent explosions you want to get the mines like Sir William Garforth's mines; that is to say, stone dust the roads.

18,258. That is practicable?—Quite practicable. There is plenty of experience on the subject. There are people who hold another opinion, but it is my very strong opinion.

18,259. That is to say, we really have the means in our hands if we just use them in this matter?—I think so. I think these huge explosions are a disgrace to this country.

18,260. It is a question of simplifying and tightening up the regulations?—I think so.

18,261. I am interested with regard to what you say on page 2 with regard to your account of your visit to Scotland. You make a statement referring to mining districts generally in Scotland?—To Scotland in particular. Lanarkshire and Ayrshire are the places I refer to there. I have not been there just lately, but Mr. Robertson's description seems to me to be rather a moderate one. If I had written the description of the things as they were 8 to 10 years ago I should have put it more strongly.

18,262. Some papers described it as an hysterical exaggeration. With regard to pit head baths, you say, on the whole, public opinion, especially the opinion of women, is against it?—It was then very strong against.

Mr. R. H. Tawney: It strikes me the one class from whom we have not had evidence is the women. Would it not be very valuable to get the evidence of women about this?

Mr. R. W. Cooper: How are you going to select them?

Mr. R. H. Tawney: I presume they would find a way to select themselves.

Chairman: Would you like representatives from England, Wales and Scotland?

Mr. R. H. Tawney: I have not a plan ready. It is not beyond human wit to devise one.

Chairman: We could get some ladies who like baths and some who do not.

18,263. *Mr. R. H. Tawney*: Are you familiar with the provisions of the Act with regard to baths?—So far as I remember, baths have to be provided if two-thirds of the workmen ask for them, and the cost is not to be over 1½d. a week. I think that is the provision in the Mines Act.

18,264. That is to say, there is a limit of cost per head?—Yes, to the minors.

18,265. And to the employers?—Yes, I think it is too.

18,266. I put to you this question. I have not any knowledge. Is it not well known that in nine cases out of ten the cost per head of establishing baths will exceed the figure which is specified in the Act; and that, therefore, if the miners did vote for a bath it would often be inoperative?—That is not the evidence we had on the Miners' Commission. We went into that question of cost. The cost was considerably less than 3d.

18,267. That is what has been told me, and on that point those who have more experience have asked the question. You know the proposal of the Home Office was to make baths universal and compulsory?—Not as far as I know. It was Mr. Smillie's proposal Mr. Smillie was prepared to make miners take baths at the point of the bayonet.

18,268. Of course I did not mean that persons who did not wash were to be subject to legal penalties. I mean that a firm that does not provide facilities for washing should be subject to legal penalties. Was not that in the Draft Bill?—I only know about the recommendations of the Commission. I do not know what the Home Office may have thought.

18,269. I think I am right in saying that was in the Draft Bill?—I do not recollect that.

18,270. If you look at it again I think you would modify your opinion. I think it was in the Draft Bill and supported by the representatives of the miners and knocked out of the Bill under the pressure of the representatives of the owners?—It may have been so. The Bill as passed was very much what the Royal Commission recommended, I think.

18,271. You will find the Bill was amended in that sense if you look at it again. On page 2 you make certain statements with regard to the probable effect of nationalisation. I shall not cross-examine you about that. They are matters of opinion and your opinion is of great value. Do not you think that there is to be said that whatever disadvantages from an economical point of view nationalisation might have made there is one advantage you would not get, that is to say, the tension you get now between the desire to make the conditions safer and the question with regard to cost; they are in such an acute form. Do not think I am making imputations against managers or owners. I suggest there are certain ways of preventing accidents which do cost money and under a nationalised system public opinion will be rather more sensitive on the humanitarian side than on the economic side?—My own feeling is one of very much doubt on the subject. I have seen a great deal of the industry and the way it works, and I have seen a great deal of Government departments and the way they do things. It appears to me one has a soul, the other has not—just a mass of regulations. Ordinary individuals on the other side are very anxious to do their best.

18,272. Before this imposing mass of regulations were made under the Mines Regulation Act were there not a good many accidents that could be prevented and were prevented by the regulations?—I think they always level up the mines that are backward.

18,273. Even there there may be some soul lurking beneath this forbidding red tape?—I am complaining of too many regulations, not the main ones that exist in the Mines Act. They are most valuable and necessary.

18,274. *Mr. Arthur Balfour*: I think you are of the opinion that nationalisation of the mines is not necessary to secure proper safety and health?—Certainly not necessary.

14 May, 1919.]

DR. JOHN SCOTT HALDANE.

[Continued.]

18,275. Private enterprise could do all that is necessary, if associated sympathetically with the State, with regard to inspection, new acts, and so on?—I think so.

18,276. You are of opinion the profit does not come before safety in the minds of the present owners?—Certainly, in my experience, profit does not come before safety.

18,277. Do you think it would be a good plan to have a definite revision of the Mines Act at fixed periods, so as to bring in new improvements to prevent explosions?—I think that is very necessary. In practice it is done by the Home Office by introducing new regulations, but it is always governed by the last Mines Act.

18,278. Ought it not to be a definite period, say, every three or five years?—I should like to see it. The existing Mines Act is out of date in many respects already.

18,279. Do you think any consolidation of the coal-fields or of the collieries and districts would help in connection with the safety and health of the mines?—I do not feel I am qualified to express an opinion upon that subject.

18,280. Now, as regards the housing question. A very great number of good houses have been put up by employers in different parts of the country?—Yes.

18,281. Where there are bad houses, it is not due, or certainly not entirely due, to the employer that those bad houses exist?—I think some of these bad houses have been put up by the employers perhaps 50 years ago, or more. I do not know. Some of the Durham houses are old colliery houses.

18,282. I gather from your *précis* it is necessary to educate the miners up to the desire for better houses and the willingness to pay higher rents for better houses?—I am impressed with the force of custom. In some districts no miner would think of asking for a house for 2s. a week or expect to find it in this world.

18,283. If he was living in any town he could not find houses of that kind?—I do not think so.

18,284. Are you in favour of the Minister of Health?—Yes.

18,285. Do you think such a Minister of Health should have control of the health of the miners as well as the general population?—Certainly, above ground. There may be difficulties below ground of separating health from other subjects.

18,286. Great care will have to be taken to make the provision clear?—Yes, at present the medical officer of health is responsible for the whole of the condition in the mining villages, say.

18,287. As regards the question of baths and drying arrangements for the miners' clothes, if the provision of baths and drying arrangements was to be allowed by the income tax authorities against revenue and made compulsory on the owners and miners to use them, do not you think that would be a quick way of settling the question?—It would be quick. I should gladly have supported Mr. Smillie about 10 years ago, that is to say, making it compulsory on both sides, but I was afraid of bloodshed then, and that was why I did not support. I found there was such a strong feeling against it. I was not prepared to apply violent compulsion to my fellow countrymen when there were so many against it. I do not know how that stands now, or what the feeling is amongst the miners.

18,288. I think, from your reply, we may assume it was not the fault of the private owners that baths were not generally provided?—As far as I know, not—it was certainly not.

18,289. Where do you find that strong feeling against baths?—Where I went in the mining districts. It was a terrible disappointment to me: I was very keen about baths.

18,290. On which side, the owners' side or the miners' side?—On the miners' side. I did not think of the owners. As far as I saw the owners were perfectly willing to do anything and were anxious to.

18,291. Do you know under the Mines Act a great deal of the provisions for the welfare of mines was allowed against revenue?—Yes.

Mr. Sidney Webb: Only those firms paying excess profits.

18,292. Mr. Arthur Balfour: Would it not be a reasonable way of applying these things, such as baths and drying arrangements?—Certainly; they would be part of the expenses of the colliery.

18,293. They would not. They would be capital provisions unless provision was made specially. Unless special provisions were made and the Income Tax agreed, the baths would be capital expenditure and not allowed against revenue?—That is to say, the capital expenditure in setting them up would be?

18,294. Yes.—I should think they ought to be charged in the same way as anything else connected with the colliery is charged.

18,295. I point out to you the bulk of the welfare work during the war was charged against revenue by special provisions of the Act?—Yes.

18,296. And that helped to improve very considerably the health arrangements in this country?—Yes; it may be a good thing.

18,297. Mr. Herbert Smith: On your first page you make a comment about the prosecution that took place and about a man being very ill-advised. Was not that about an accumulation of gas and in not having proper ventilation?—There were a number of counts in it, but that was one.

18,298. Accumulation of gas and not taking proper precautions and ventilation to remove it, and also very dusty?—Those were the counts. There was a very, very strong defence. They were taking better and much closer precautions, as far as I know, than any other mine in the country at that time.

18,299. We had an explosion at Bentley Colliery, where three or four men were burnt?—That was a small explosion from a gob fire. It was these gob fires that made them so very anxious to take precautions with regard to ventilation and dust.

18,300. There were any amount of gob fires?—In Bentley?

18,301. Yes.—There were a number and that made them so anxious and in the other pits there.

18,302. Do you not think the men thought that was a wise precaution for the protection of these lives?—The Home Office was prosecuting a man who was not doing all he might do to make things safe.

18,303. The Home Office was prosecuting a man who was not carrying out the Mines Act. Is not that correct?—The prosecution nearly fell through. There was only one technical point.

18,304. Am I right in this that you made this statement, but you did not do it, that is, if you went down Bentley Pit with a naked light there would be no fear of anything happening. You made that statement?—I admitted it.

18,305. You made it.—I admitted it. I said there was enough coal coming out of Bentley Pit to light any of the capitals in Europe.

18,306. Gas?—If it was converted into gas.

18,307. No.—There was gas enough coming out to light Doncaster if you could collect it—there was 1·3 per cent.

18,308. You would not be surprised if I told you Yorkshire miners have some very strange opinions about you making statements like that?—It was Sir John Cadman who made the statement for the prosecution.

18,309. But you admitted it?—Yes.

18,310. You did not do it, neither did Sir John Cadman. Neither of you went down with naked lights to see if it was right or not?—We should have been put in gaol if we did, and rightly too.

18,311. If you want to convince us you ought to have done it?—To have gone round with a naked light? If anybody had tried to do that I should have handed him over to the police.

18,312. That is what we thought you wanted doing with, handing over to the police when you made that statement?—All I meant was the ventilation was very good and the percentage of gas was a long way below the danger limit.

14 May, 1919.]

DR. JOHN SCOTT HALDANE.

[Continued.]

18,313. I do not know what you intended to say. I know the effect it left if that was your idea of a fiery mine?—My statement was perfectly clear.

18,314. You refer to Brodsworth village houses and you talk about miners not being willing to pay more than 2s. a week. You do know at Brodsworth they pay from 6s. to 10s. a week?—Yes.

18,315. Would you call that a modern village?—They are very good houses.

18,316. Are they? Would you like to live in one built similar to what they are costing to build—cost of labour from £17 10s. to £19 a house?—I do not know about the cost. That was built by the late Sir Arthur Markham, who had an extraordinary interest in all having good things.

18,317. I admit at once they are better houses than those generally found about that locality. They are not ideal houses. They look better outside?—I admit they were aesthetically designed with special colours.

18,318. Have you found houses at Denaby and Cadeby? You spent a good time in Yorkshire and did not get much result from what you did?—I do not know those houses.

18,319. Close to Doncaster?—I know that pit.

18,320. Did you see the houses at Sharlston, near Wakefield?—No.

18,321. Did you not see Whildale Lane ideal houses?—No.

18,322. Built on a bog soil—damp. It has been decided they are not fit for human habitation, but the people cannot be turned out because there are no more houses for them to go into. Do you remember that explosion that happened at Altofts in 1886 or 1887?—I remember the circumstances.

18,323. They were a very long time in getting any reform with regard to it. You complain about slow process in getting compulsory dusting?—The facts were not known then.

18,324. Do you not know ruiners are up against dust that is being used, and it is causing asthma and bad eyes?—I do not know, unless that is where flue dust is being used.

18,325. You come down one day and I will take you down, and you can have a dusting and see how you like it?—Is that flue dust?

18,326. It is ordinary dust that is ground out of the Stone and Bind from Roof?—Where is this?

18,327. At Denaby and Cadeby and in some places in Doncaster, and really all over Yorkshire?—I have often been down some of these pits myself, and I did not notice anything the matter with them.

18,328. *Mr. Robert Smillie*: You are looked upon as a scientist as far as ventilation and health conditions underground are concerned. Is it not rather a dangerous thing to say that you could go round that colliery with a naked light? Was it a good example to leave with the men there?—I cannot remember the statement. As far as I remember it was particularly put to me by the Home Office Council: "Could you go round that? I said there was a good deal less fire-damp than was dangerous; it was nowhere near the explosive limit." I have a very vague recollection of this.

18,329. Were you giving evidence there on behalf of the company?—Yes, I was in defence.

18,330. Does your opinion at the moment depend upon which side you are giving evidence on?—No, I do not think so. I was very strong in my opinion in that case. I was very indignant at the whole thing.

18,331. That is the feeling that has got abroad, rightly or wrongly, that it depends upon which side you are giving evidence as to your opinions of gas?—I am not in the habit of giving evidence. The only cases I have given evidence in were where I had strong opinions. I have given evidence, very strong evidence, in support of the Home Office, for instance, about incompetent firemen in Scotland.

18,332. I suppose it might be taken the miners, if it is true that Sir John Cadman and yourself made this statement, might have taken it literally that the pit was really in a fit state to go down with a naked light. Would not it be a dangerous thing to believe?—Certainly. If they do not read the evidence carefully it would be a dangerous thing.

18,333. From a question about housing. You and I went round a considerable number of houses in Ayrshire?—Yes.

18,334. Do you remember going into some of the houses where the women said three times in a year they papered the walls?—I remember the damp houses which Mr. Robertson did not refer to and I should have referred to if I had been Mr. Robertson.

18,335. Do you remember going into one house as clean as a new pin and the young woman in it was as clean as could be, but she had to put paper on the walls three times in the first year?—Yes.

18,336. Did you see the third paper falling off the wall then?—The impression left was they had no damp course and had bad leaky roofs.

18,337. Were there any houses available within 3 or 4 miles as far as you know in Ayrshire that the miners could get with the exception of employers' houses, and they were all about the same condition? Did you see any houses?—Not at that place.

18,338. Did you see a house fit to live in for miles round?—Not at that place, so far as I remember.

18,339. Then it is not fair to say it is because those people would not pay more than 2s. or 3s. a week that they are not in better houses if they had the opportunity to go into better houses. If they had the opportunity of going into better houses and did not go you would say that was true. If they did not get any houses that had been built within the last 60 years it would not be fair to condemn them?—Supposing it had been myself and I found I could not get a decent house if I wanted to work at the colliery, I should never work at the colliery. I should not go there at all.

18,340. Supposing you shifted to another district and you were in the same position you would have to shift again. You would shift from place to place until you found a decent house?—Yes, certainly.

18,341. It would take some shifting in some parts of Scotland?—There were places where we were told some houses were available.

18,342. Some of our people have shifted to America to get a decent house. In Lanarkshire you remember the horrible roads where the filth was nearly to the front door?—Yes.

18,343. Did you hear a woman say she did not want the baths at the pit but wanted her man home as soon as possible?—I remember the expression.

18,344. Have you seen that for miles around there was not a decent house to be got? I guarantee you did not see any within miles of that place. I put it to you only in one case of the enquiries you made, did a woman say she did not want baths at the pit but she wanted her man to come home?—That is not my impression. I remember one woman in favour of pithead washing, and I think she was very sensible and good about it.

18,345. I will take you to a place and you can east your mind back to a place you and I know very well, and the only place in this country where the baths have been established, that is at Mr. Fletcher Burrows at Leigh. You have been there?—I think I have; I am not sure.

18,346. Do you remember Mr. Burrows saying to us that if he stopped the baths there would be a strike at the colliery?—I am not sure I was with you at the time.

18,347. You do not know if you have been at Fletcher Burrows?—I cannot remember now and that is the only reason I cannot answer your question.

18,348. You are aware that they do not pay anything for the baths there at all?—No doubt it is so if you tell me so.

18,349. Do you know that if you go down another pit and they wanted the men to come up the other shaft and go home without a wash they would threaten to come out on strike?—I am very glad to hear that. I am sure this matter of pithead washing only wants to be introduced and understood by the men and all concerned for it to become established as a custom in this country as it is in Cornwall.

14 May, 1919.]

DR. JOHN SCOTT HALDANE.

[Continued.]

18,350. Did we not visit many places in Westphalia?—Yes.

18,351. Is it not a custom that a man must not go to the pit with his pit clothes on?—Yes.

18,352. Do you remember the committee you were on with me when we recommended the baths?—Yes.

18,353. Are you aware that the Bill introduced by the Government was going to go through without any mention of payment for baths, and the employers on behalf of the Mining Association of Great Britain had put into the Bill the clause with regard to it?—I remember the recommendation of the Royal Commission that recommended them.

18,354. They did not recommend them?—I think they did.

18,355. *Sir Adam Nimmo*: Would you not say that the houses that are referred to by Mr. Smillie are of an exceptional character?—I do not know enough about Scotland. Certainly in other parts of Scotland there are much better which I have seen.

18,356. Is not the tendency of deputations who wish to examine miners' houses to go and examine the worst of the houses?—I do not know. I examined the houses and I was very much impressed by their badness.

18,357. I recently took part in a deputation to Scotland along with the President of the Board of Trade and the Controller of the Coal Mines. The houses which we were asked to go and see were, I think, picked out as the worst houses we could go to.

Mr. Robert Smillie: And the best.

Sir Adam Nimmo: Produced by the County Council.

Mr. Robert Smillie: Did we not say the best houses were at Hamilton Palace, and we would take you to see them there? You are not going to answer that question. You know it is true.

Sir Adam Nimmo: It does not bear on the point. I agree you brought us round by some County Council houses. With regard to the employees' houses the deputation was taken to see the worst houses.

Mr. Robert Smillie: And the best.

Sir Adam Nimmo: I am not aware of that.

18,358. Do not you find poor houses in every large centre?—Certainly, and shocking houses.

18,359. Are you aware of the number of persons in Scotland, taking the large cities such as Glasgow, Edinburgh and Dundee, who are living in single and double-roomed houses?—I used to be very familiar with it. I specially investigated these things in Dundee and I was familiar with it in Edinburgh when I was a medical student.

18,360. Would you take it from me, the greater part of the population is living in these houses. I can give you the figures?

Mr. Robert Smillie: Single room.

18,361. *Sir Adam Nimmo*: 62 per cent. in Edinburgh, single and double; 63 per cent. in Dundee; 65 per cent. in Paisley. Is not the problem with regard to houses a national problem? It is not peculiar to the mining districts?—There is this about the mining industry, that there may be no other house near available, except some very bad ones.

18,362. You would agree, I suppose, that even in the mining districts the position has been essentially progressive?—Yes, as far as I know, the quality of the houses has gone on improving.

18,363. And the houses being put up are of a good character?—Yes, as far as I know those now put up by mining companies are good, but there are often not enough.

18,364. Is there not a great deal of reconstruction work with regard to old houses going on?—That I do not know about. Old houses being pulled down?

18,365. Yes, and reconstruction?—I do not know. I am quite clear a lot of these houses Mr. Smillie and I saw ought to have been pulled down, and done away with altogether.

18,366. Would you think I was making a correct statement if I said the colliery owners in Scotland have been spending many thousands a year before the war on houses?—I am sure your statement is correct.

18,367. With a view to improving the housing conditions of the miners?—Yes.

Chairman: The next witness is Dr. Frank Shuttlebotham.

Sir Adam Nimmo: Might I suggest that the cross-examination of this witness be left over. These are very important witnesses. We might have the proof put in. I suggest we should carry on much too long if we began to cross-examine.

Chairman: I hope the cross-examination will be confined to our gentleman on one side and one on the other. We are nearly three days behind our time-table. If you will agree to-morrow morning to put off your Report until the 20th July, well and good.

Mr. Sidney Webb: I support that. I want to ask Dr. Shuttlebotham and Mr. Walker quite a number of questions.

Chairman: Then we shall not finish by the 20th June.

Mr. R. H. Tawney: I suggest we might sit really late. If one is going to spend the evening here until half-past seven, we might as well spend it till half-past nine or ten.

Chairman: Are you willing to sit until 10 o'clock?

Mr. R. H. Tawney: We cannot do our work to-day.

Mr. Robert Smillie: I suggest we should proceed for a time.

Chairman: I had hoped the last witness would have been cross-examined by one gentleman on each side; instead of that it was not so. If you all want to ask questions we cannot finish.

Mr. Evan Williams: I think we should not take important witnesses like Dr. Shuttlebotham and Mr. Walker at the end of a long day.

Chairman: I tell you frankly the Report will not be finished by the 20th June.

Mr. Sidney Webb: There is still the alternative to sit on additional days.

Chairman: After this week, are you willing to sit on Mondays and Saturdays?

Mr. Sidney Webb: If necessary

Chairman: It is necessary. Then after next week we sit Saturdays as well, and after that on Mondays and Saturdays as well as the other days.

Sir Arthur Duckham: Have you allowed for a few days?

Chairman: I am afraid we shall have a very few. During the last two days we have got so much behind the time that we are now getting into serious difficulties.

Sir Arthur Duckham: Then keep us late. I think those few days are more important to us than anything else.

Mr. Robert Smillie: I suggest two things might be done. If you say two to cross-examine on either side or one on either side, then we can make up our minds with regard to it.

Chairman: To-morrow, Mr. Webb, will you cross-examine Dr. Shuttlebotham, if you want to?

Mr. Sidney Webb: Yes.

Chairman: Who shall we say on the other side?

Sir Leo Chiozza Money: I think it is a little unfortunate to limit us.

Sir Adam Nimmo: There are other witnesses who could be much more readily passed over.

Mr. R. H. Tawney: Who are these after these witnesses?

Chairman: There are about 50 left.

Mr. R. H. Tawney: If we have any more of the sort we have had during the last few days, I suggest one on each side would be ample for them.

Mr. Sidney Webb: We have put off a good deal, because we were to ask Mr. Walker. It is the question of the selection of the witnesses.

Sir Adam Nimmo: We might be able to cut down some.

Chairman: Would the Commission like to adjourn now?

Mr. Sidney Webb: Could we put these two roofs in without reading them?

14 May, 1919.]

DR. JOHN SCOTT HALDANE,

[Continued.]

Chairman: I do not think we can do that. We must have the evidence read. I do not propose to read all Dr. Shuttlebotham's proof.

Mr. R. W. Cooper: Could we not take his proof now, and have his cross-examination to-morrow?

Chairman: We will do that certainly.

DR. FRANK SHUFFLEBOTHAM, SWORN AND EXAMINED.

18,368. *Chairman:* I believe you are a Master of Arts and Doctor of Medicine of Cambridge; a Justice of the Peace, and Medical Adviser to the Ministry of Munitions, Member of the Chemical Warfare Committee, and that you have contributed a number of articles on industrial diseases to the Medical Journals, and that you are a Medical Referee under the Workmen's Compensation Act for the North Staffordshire District?

18,369. I will read first of all that part of your proof which deals with accidents in mines. You say:—

“With regard to the number of accidents in mines the Commission already has information on this point, and I strongly urge that steps be taken to diminish, not only the number of accidents, both fatal and non-fatal, but efforts should be made to improve the treatment of non-fatal accidents so that recovery may take place in a shorter time and the period of incapacity for work be thus diminished.

I would like to point out that, in spite of legislation, since 1893 there has practically been no reduction in the number of fatal and non-fatal accidents which occur in the mines of this country year by year. In addition to 1,300 fatal accidents there are more than 160,000 non-fatal accidents which occur from the nature of the men's employment. It is interesting to learn that a greater number of persons are disabled for two to four weeks than for any other stated period, and roughly speaking there are 50,000 miners injured every year in such a way as to incapacitate them for work for between one and three months, while the number of injuries which cause incapacity between one and two weeks is extremely small, being about 8 per cent. of the total. Almost as important as the yearly death roll is the number of miners who are incapacitated each year and who have not recovered at the end of one year, this number amounting to something like 12,000 per annum.

I would like to emphasise, in speaking of the question of accidents, the importance of injury as a causation or aggravation of disease, especially of tuberculosis. This is a subject I refer to in detail in my Milroy Lectures, which I delivered before the Royal College of Physicians in 1914.

Accidents do not mean in the miner simply broken limbs or sprained backs, but the injury may set up a sequela of symptoms which show that diseases of a very serious nature may arise or may be intensified as a result of the original accident.

I believe that the ambulance arrangements at all collieries are most efficiently organised, so that serious cases can be conveyed to the nearest hospital centres with all possible speed, but in view of the fact that the large proportion of injuries arising out of the employment in the mines consist of sprains of muscles and joints, particularly of the loin muscles, something more should be done for such cases. There are tens of thousands of miners disabled in these ways treated at home under the National Health Insurance Scheme, where the treatment simply consists of applying liniments prescribed by the panel doctor. This treatment amounts to no treatment at all. If they were treated seriously as disabled soldiers in the hospital have been treated I feel sure that the duration of the incapacity for work might be halved.

There should be provision in all colliery centres for massage and electrical treatment, so that the men who are injured in the mine can have the best attention and treatment at convenient centres. This treatment would be of the highest value in dealing with cases of neurasthenia, which are intractable unless a systematic treatment is carried out in the early stages. Again, through the lack of proper treatment and the small amount which is paid to the disabled man from the Workmen's Compensation Fund, in the majority of cases he is unable to obtain proper food and runs the risk of getting into debt

How is it possible for a disabled man who requires special nourishment on account of his disability to keep himself and his wife and family on 25s. a week?

I suggest that arrangements should be made for the better after-treatment of injuries which would include massage and electricity for suitable cases, especially those of fractures and sprains, and that the Workmen's Compensation Act payments should be increased, so that the disabled men should obtain proper nourishment and be relieved from financial anxiety.

It may be said that if the weekly payments of compensation be increased, it is an inducement to malingering or exaggeration of symptoms. In my experience, working men who are disabled through injury and who can claim compensation are no more likely to exaggerate their symptoms than patients who find in better circumstances in private practice.”

Then, I do not think we need go into Miners' Nystagmus, which is a well-known disease, and on which you have written a long memorandum.

Then we come to your recommendations, and then you say, “With a view of improving the health condition of miners, I make the following recommendations:—

1. That provision be made for reducing the temperature of hot seams in the coal mines, and that a temperature of not greater than 77° F. (wet bulb) be regarded as injurious to the health of the worker. (This is the standard adopted in France.)
2. That the question of increased candle-power of the miner's safety lamp be considered without delay. In my opinion this work could be carried out most efficiently by a small committee of experts specially selected for this purpose.”

18,370. Is that to remedy Nystagmus?—That is so.

18,371. And then you say: “3. That the housing question of miners be dealt with in a practical way and with all possible speed. 4. That investigations be made as to the causation and prevention of such miners' diseases as bent hand, bent knees and the skin diseases to which miners are specially prone.” Do you include in that ankylostomiasis?—I do not mean ankylostomiasis, but diseases such as inflammation of the skin and septic rashes set up by the action of pit water and other conditions.

18,372. Then you say: “In my opinion, these questions would be most efficiently investigated by the Medical Research Committee. (5) That means be taken to ensure the best possible after-treatment for miners who sustain injuries or contract diseases which are directly due to their employment in the mine.”

I have read all your views with regard to accidents in mines, and I am going to read your views with regard to nationalisation. “With regard to the nationalisation of mines, I have not sufficiently studied this subject in all its aspects to give an opinion that is worth very much. All that I would say is that the Coal Mines Act, 1911, gives full power to the Secretary of State to make such general regulations to prevent dangerous accidents and to provide for the safety, health, and convenience of persons employed in the mines, but it does not appear that he has availed himself of his powers in this direction to any extent.

The record of the Home Office with regard to the health conditions of miners is very disappointing. On their own initiative they appear to have done very little, and there is not, and never has been, a Medical Department dealing with mines attached to the Home Office. Whether improvements would be made under a Scheme of Nationalisation is one

14 May, 1919.]

DR. FRANK SHUFFLEBOTHAM.

[Continued.]

that the future can only tell. The great lever to bring about such improvements is undoubtedly public opinion and the attitude that this Commission takes in dealing with these questions.

"Should nationalisation come about or not, I strongly urge that there should be a Ministry of Mines, with a Medical Department, the head of which should not be in a subsidiary position (as the medical adviser to the Factory Department is at the Home Office), but that he should be a member of the Minister's Council, with free access to the Minister."

18,373. Now, if there is anything else you would like me to read, I will certainly do so. I have read your valuable memorandum upon the causation and prevention of miners' nystagmus, but I do not think, unless you desire it, it is necessary to read the whole of that?—I do not think so, but there are one or two points to which I would like to draw attention.

18,374. What are those points?—I think, with regard to the introductory remarks, something ought to be said with regard to the amount of wear and tear to which miners are subject as the result, in my opinion, of the conditions of their employment. I think that that is particularly important in view of the comparatively early age at which miners give up their work, and the small percentage of miners who are found actually working in the mines at over the age of 50.

18,375. I will read that:

"The Registrar-General's report, however, cannot be said to represent the whole picture of the health conditions of miners, as, it will be easily understood, he is dealing with dead men and not with those who are alive. My own impression is that working miners are a healthy set of men. The coal mining industry is a selective industry, in which there are no light jobs, and unless a man is strong in wind and limb he is unable to carry out his arduous duties in the mine. On the other hand, the continual work-

ing in the mine undoubtedly produces wear and tear, which is shown very clearly in miners over 40 or 45 years old. Arterio-sclerosis, or degeneration of the blood-vessels, is very frequently found in its initial stages in miners between these years, and, speaking from an experience of 15 years' work in a coal mining district, it is my opinion that the percentage of men working underground over 55 years old is relatively small.

"It is not surprising that miners should be predisposed to this general wear and tear when one considers, not only the arduous nature of their work, but that they are working practically in the dark and very often at high temperatures, with an atmosphere charged with a good deal of moisture."

18,376. What is the next point you would like me to read?—I would like to emphasise the question of temperature in mines.

18,377. You say in your proof under "Temperature of Mines":—

"Great Britain is the only European country in which there is no legislation to regulate the temperature at which men work in coal mines, and I think that this country should be brought into line with the other principal European countries, and employment forbidden in workings where the wet bulb thermometer reading is so high as to be injurious to health. I am not going to lay down what the limit shall be. That should be a matter for full consideration. But when we realise that the Lancashire weaver, the Staffordshire potter, and the collieries in France, Germany, and Belgium are protected against working in temperatures recognised to be injurious to the health, I do not think it unreasonable to suggest that legislation should do at least as much for the coal miner in this country."

18,378. Is there anything else you want to draw attention to?—I do not think so. I think most of the other points have been raised by Dr. Haldane.

(Adjourned to to-morrow morning at 10.30.)

SECOND STAGE—THIRTEENTH DAY.

THURSDAY, 15TH MAY, 1919.

PRESENT:

THE HONOURABLE MR. JUSTICE SANKEY (*in the Chair*).

MR ARTHUR BALFOUR.

MR. ROBERT SMILLIE.

MR. R. W. COOPER.

SIR ALLAN M. SMITH.

SIR ARTHUR DUCKHAM.

MR. HERBERT SMITH.

MR. FRANK HODGES.

MR. R. H. TAWNEY.

SIR LEO CHIOZZA MONEY.

MR. SIDNEY WEBB.

SIR ADAM NIMMO.

MR. EVAN WILLIAMS.

SIR RICHARD A. S. REDMAYNE (*Assessor*).

MR. ARNOLD D. McNAIR (*Secretary*).

MR. GILBERT STONE (*Assistant Secretary*).

Sir Allan Smith: Sir, before you proceed with the further examination of the witness, I should like to refer to a question I put to Sir Malcolm Delevingne yesterday. I asked whether he was giving personal evidence, or giving evidence officially on behalf of the Home Office. He replied that he was giving the official view of the Home Office. I do not know

whether it is possible for us to accept the official view of a Government Department from the hands of an Assistant Secretary without having an authority from the Minister in charge of that department justifying us in accepting the views of the Assistant Under-Secretary of State as the official views of a Government department. I do not know

15 May, 1919.]

DR. FRANK SHUFFLEBOTHAM.

[Continued.]

whether a Government department can give official evidence of that description without committing the Government as a whole, and having regard to the answer which Sir Malcolm Delevingne gave to me, I should like to know exactly where we are, and whether the evidence that he has given, being official evidence on the part of the Home Office, is the official mind of the Government on the points upon which he spoke.

Chairman: That is a very important question, and I am very glad you have raised it. I had better say what my personal view was, and then I will make enquiries. A number of gentlemen who have given evidence from various Government departments have been careful to put at the head of their proofs that the witness only expresses his own view and not the view of the Ministry. My own view is that Sir Malcolm Delevingne is in the same position, and as he was giving evidence of what his personal

views were I do not know whether he had authority to commit the Home Office, but I should say certainly not the Government. That is my own view, but we can make enquiries.

Sir Allan Smith: My difficulty is that the answer he gave stated that he was giving the official view and not his personal view.

Chairman: As soon as I got the shorthand note I will look at the answer and make enquiries. I am very glad you have mentioned the point, because it had escaped me.

Sir Adam Nimmo: Sir, would you give me an opportunity at some time to make a personal explanation to Mr. Smillie on a question which he raised yesterday? He is not here this morning; otherwise I would have taken the opportunity now, with your permission.

Chairman: Yes, certainly. As soon as he comes you can do that.

DR. FRANK SHUFFLEBOTHAM, Recalled.

18,379. *Sir Adam Nimmo:* (To the Witness.) In the fourth paragraph of your *précis* you deal with certain mortality figures. What year have you taken?—I have taken the figures that appeared in the last Registrar-General's Report. They are the figures prior to the war.

18,380. Would it not have been better, in dealing with your figures, where you contrast the mortality in respect of the miner with the mortality as a whole, to have excluded from the larger figure the mortality in respect of the miner?—I do not quite understand your question.

18,381. When you deal with the figure of 175 I see you include in that figure the mortality applicable to the miner?—That is so.

18,382. And thereby, of course, you reduce that average considerably?—Yes.

18,383. Of course, by taking the figure that you use later you increase the average by bringing in the figure of the miner?—That is so.

18,384. Would it not have been better, in making the comparison that you have done, to have excluded from the larger figure the mortality in respect of the miner?—I think it would have made it clearer.

18,385. I see that you speak of the mining industry as an exclusive industry?—A selective industry.

18,386. In what sense do you use that word?—I use it in this sense—that, in my opinion, a man who is a weakling is unable to work in the mine. It is an occupation for strong men, and both men and boys must be physically fit before they are able to work in a mine.

18,387. Would you not say that as a matter of general practice the sons follow the fathers in connection with this industry?—That is so.

18,388. It may be merely an argument that the miners as a class are a virile body of people?—Yes, that is so.

18,389. I see you lay great stress on the question of nystagmus. I do not wish to go into that very largely, but may I ask you if it is the general medical view that there is no doubt whatever about the cause of nystagmus?—That is so.

18,390. You think it is undoubtedly proved that it is due to poor light?—Yes.

18,391. It has nothing to do, has it, with the angle of inclination at which the men work constantly?—I do not think so.

18,392. You think that is entirely disproved?—Yes, it is entirely disproved, and it is disproved from the fact that one never finds miner's nystagmus in coal pits, or in ironstone mines where naked lights are used. It is an unknown disease in those pits.

18,393. You have not any view that the coalowners stand in any way in the way of the best light being secured?—No. I do not think so. The only thing is, I think, that a certain amount of responsibility devolves not only upon the coalowners, but also upon the men in not having insisted upon something being done to improve the lighting conditions of the mine, especially when one realises that miner's nystagmus is the commonest of all industrial diseases in this country.

18,394. So that from the humanitarian aspect of the subject the coalowner is interested in doing the very best possible to secure the best light for the men?—Certainly.

18,395. As a matter of fact in the past he has done a good deal to encourage research in that direction, has he not?—That is so.

18,396. After all, as to what is the best light, or what is the best that could be done in securing the best light, is a matter for careful scientific investigation?—That is so.

18,397. And when expert opinion has decided upon the best light that can be used you have no doubt that, so far as the coalowners are concerned, they would welcome that light?—I feel sure they would.

18,398. I notice you say a good deal about the housing question in relation to the men, and you say that the houses that have been provided have been houses for miners and not homes for miners: Do you think that these remarks apply only to miners' houses?—No, I do not, but I think that the housing condition of the working people in this country at the present time is deplorable. I do not think it is worse for miners than for other classes of the community, except in so far that a miner is occupied in a dirty occupation. As a rule he has a large family, and with his dirty work and dirty clothes, it is all the more important that his housing conditions should be even better than those of working people engaged in other industries.

18,399. I suppose you would take the view that the public authorities have had powers by which they might have brought about very considerable improvement?—That is so.

18,400. Have they exercised those powers?—In my opinion, no.

18,401. So that the problem that is involved is one that probably concerns the public authorities much more than it does the employers?—It concerns them quite as much.

18,402. Do not public authorities act very largely from the public view point; that is to say, it is public opinion, after all, that is the driving force behind either local or imperial legislation?—Well, I think this with regard to the housing question. So far as my experience goes—and I have had six years' experience on the Staffordshire County Council—what I found was that the County Council would draw up a report on the housing conditions in a given district and would send on the report with recommendations to the local authority and that the local authority never put them into operation.

18,403. Do you think that taking the rank and file of the men themselves there has been any very strong demand or any demand at all for better housing?—I think there has been of late years.

18,404. Do you mean since the war began?—Yes.

18,405. And probably since this Commission began to sit more than at any other time?—I have not had the opportunity of making observations since the Commission began to sit.

18,406. I think you make special reference to the question of housing accommodation in Scotland?—Yes.

15 May, 1919.]

DR. FRANK SHUFFLEBOTHAM.

[Continued.]

18,407. Have you any personal experience of housing accommodation in Scotland?—Yes.

18,408. Do you know the mining districts in Scotland well?—I cannot say that I know them well, but I know Ayrshire.

18,409. Have you spent any considerable time in investigating the housing question in Scotland?—No, but I should like to say this. When I obtained this information I wrote to the Medical Officer of Health in each mining county in Scotland and I made these remarks on the strength of the reports which were sent on to me.

18,410. *Mr. R. W. Cooper*: You made them on the reports?—Yes, I made them on the reports and any supplemental questions that I might have put to the medical officer.

18,411. *Sir Adam Nimmo*: Apart from Ayrshire do you know the problem from a close personal investigation?—No, I do not.

18,412. Do you know anything about the extent of the problem of the single apartment in Scotland generally?—Not personally. I only know it from the reports which I have received from the Medical Officers of Health.

18,413. Do you know the extent of that problem apart altogether from the mining population?—I heard you say something on this point yesterday.

18,414. I would like to give you some figures to show you the extent of this problem in Scotland generally and I take first of all the single apartment houses. The figure that I have as applicable to Glasgow, for example, is this: that 14 per cent. of the population is living in one-roomed houses; that in Dundee 10 per cent. of the population is living in one-roomed houses; that in Edinburgh 6 per cent. of the population is living in one-roomed houses; that in Aberdeen 5 per cent. of the population is living in one-roomed houses. I put it to you that these are not centres that contain any considerable mining population at all?—That is so.

18,415. As a matter of fact, some of them do not contain any mining population?—That is so.

18,416. And yet these figures go to show that a considerable portion of the population in Scotland is living in single apartments?—Yes.

18,417. Apart altogether from the mining position?—That is so; but I think they show something else—that something ought to be done at once to remedy these evils.

18,418. Yes, I am not objecting to that view, but I merely wish to bring out this—that you are here dealing with a very big question. Is that not so?—Yes. A national question.

18,419. Do you know anything of the figures applicable to Scotland as to the population that is living in one and two-roomed houses?—I have not got the figures at hand, but I have seen them.

18,420. I mentioned some of these figures in examining *Dr. Haldane* yesterday.

Sir Leo Chiozza Money: Could we have these figures put in to save our time? I cannot see with regard to the housing in every part of Scotland what relation it has to the mining industry. You have appealed to us to save time. I do not see the relation unless we indict other industries as well as the mining industry.

Sir Adam Nimmo: I submit that a considerable indictment has been brought forward against the mining industry in respect of its housing accommodation, and that it is suggested by way of argument that that is a special reason for nationalising mines. I am bringing forward these figures to show that this is a very much wider problem altogether, and that it ought to be dealt with from a national point of view. I submit within that position my questions are perfectly relevant.

Chairman: Yes.

Sir Adam Nimmo: I do not want to traverse more ground than is necessary.

Chairman: Yes. You have not many questions to ask, I am sure. We will get the figures put in because time is valuable.

Sir Adam Nimmo: Yes, I will not take up more time than is necessary. I gave the figures yesterday, but if the figures are to be put in I will not delay over them.

Chairman: *Sir Adam*, we had not the advantage of having your advice and assistance when we had our first enquiry, but when the first enquiry was on there was put in—no doubt every Commissioner except myself read it—a report of the Royal Commission on Housing in Scotland. You will find all the information there, and it is before the Commissioners. There are only about 500 pages to read.

Sir Adam Nimmo: The figures which I have given are taken from that report, and it is a very exhaustive report.

Sir Leo Chiozza Money: May we have permission to cross-examine on this?

Chairman: No, we have it all in the report. Everyone has read the report, I am sure, except myself.

18,421. *Sir Adam Nimmo*: (*To the Witness*.) I put this as a general question—that in Scotland you have a very large percentage of the population living in either a one-roomed house or in two-roomed houses?—That is so.

18,422. And you agree with me that this is not a problem that specially refers to the mining industry?—Not particularly. It refers to the whole housing question.

18,423. And that it is in no sense bound up with the question of the nationalisation of mines?—Not so far as I am concerned.

18,424. On the question of housing I should like just to say this. You refer to the fact that you had taken the question up with the various medical officers in different parts of the country before you submitted your evidence?—I did it some time ago. This information with regard to housing was pre-war information.

18,425. Do you know *Dr. John T. Wilson*, the Medical Officer of Health for Lanarkshire?—I know him through writing to him.

18,426. Do you know that he is a man in a public position?—Certainly.

18,427. And a man of considerable knowledge and scientific attainment?—Yes.

18,428. We have had his report quoted in an earlier part of this enquiry and I should like to refer to one or two things he says about single and double houses. In the report which was previously referred to by one of the witnesses here, he says this: "It is very desirable that the public mind should be cleared of any sickly sentiment as to the supposed evils of a one-apartment house. There can be no doubt that a real demand exists for such houses, and they are suitable for young married people as well as for old couples whose families have left them; in other words, for the two extremities of married life. The great danger in one-apartment dwellings is their liability to be occupied by a grown-up family quite able to pay for better accommodation. Assuming, however, all one-apartment houses are only used by married couples with one or two young children, or by elderly couples who have no families at all, what objections can be urged on the ground of health when they are provided with suitable domestic and sanitary conveniences?" Do you know whether in Scotland the miner has shown any very strong desire for a better house by being willing to pay for it?—No, I do not.

18,429. May I put it to you that we ought to regard it as a reasonable attitude on the part of the miner that if he wishes for a better house he should be willing to pay more for it than he does?—I suppose so. May I ask what was the object of reading that long statement from the Medical Officer of Lanarkshire's Report? Did you ask me to accept it or not?

18,430. No, I put it before you as the view of an eminent medical man in dealing with houses of one and two apartments in a country where there are a large number of these houses?—Did you wish me to agree to it or not?

18,431. Do you agree with it?—I do not, certainly. I think that it is pitiable that a statement like that should be put in.

18,432. I am only taking it out of the report which has been already referred to. I think we all agree that the miners' houses should be made as good as is possible?—Exactly.

18,433. But we have to deal with the actual facts of the situation and that situation is a broad national

15 May, 1919.]

DR. FRANK SHUFFLEBOTHAM.

[Continued]

one. Now, coming to the question of accidents in mines, I see you say on page 2, under that heading: "steps be taken to diminish, not only the number of accidents, both fatal and non-fatal." What steps do you suggest?—In dealing with this question, I think it is most important that there should be a periodic review of the precautions taken in each mine to diminish accidents on similar lines to what took place some years ago when the Royal Commission sat to consider these questions. It is common knowledge that improvements are made from time to time in certain mines with a view of reducing the number of accidents. By reviewing the whole situation periodically, I feel certain that all mines would adopt the very best methods to prevent accidents. Further, I am of opinion that these accidents in every mine should be notified, if not week by week, certainly month by month, in the same way that notifications of diseases are notified, and they should be published, not only in Government reports, but in all the local papers, so that those responsible for the conduct of mines, whether they be managers or men, would be really put on their test to do their best to reduce the number of accidents, not only year by year, but month by month. I feel certain that this would create a public opinion on the subject, and I am convinced it would do a great deal towards the reduction in the number of accidents.

18,434. Your object, I take it, is to secure a progressive policy?—That is so.

18,435. But you are not suggesting that the methods that are adopted to-day to prevent accidents are not up-to-date?—Oh no, but I think that they could be improved.

18,436. By investigation?—That is so.

18,437. And by building upon the experience of the past?—Yes.

18,438. I take it you would agree that the process must necessarily be slow, but of course continuous?—Quite. Another point I would like to raise on this question is this: I feel sure with an improved illumination of the mine that the number of accidents will be reduced.

18,439. I see that you suggest that there should be provision in all colliery centres for massage and electrical treatment, and so on?—I do.

18,440. Do you suggest that these facilities should be provided free; that is to say, that there should be no charge upon the workmen for providing these facilities?—I should think so.

18,441. You think they ought to be provided free?—I do.

18,442. Do you know whether there is any unwillingness now on the part of the workmen to undergo this treatment?—I know of none, and I should say that if there is any unwillingness it will soon disappear. From my own experience I know, with regard to discharged soldiers who have been injured in such a way that they require massage and electrical treatment, that there is a great desire on their part to obtain this treatment, and I think this educative influence which is going on at the present time will certainly reflect upon the mining industry in which there are so many discharged soldiers and sailors.

18,443. Do you know whether the Coalowners' Insurance Associations do or do not adopt methods of securing massage and electrical treatment?—I can say so far as my own experience goes that where it is available in large hospital centres, the men are encouraged to undergo this treatment, and in centres in North Staffordshire, where it is not available, the coalowners in certain cases have actually paid for this treatment to be carried out on the advice of the colliery doctors or their medical advisers.

18,444. I think we would all agree that it must be in the interests of the employer to keep his workmen as fit as possible?—Yes.

18,445. When you come to deal with the temperature of mines, has there been any exhaustive analysis made, or any complete record of the temperatures in British mines?—I am not aware of it.

18,446. It has not been done in any thorough or organised way?—The only investigation that I know of on this point was made some years ago by Professor Cadman and Mr. Walley, who, I believe, was one of the Inspectors of Mines. So far as I am

aware, that is the only report that has been made upon this subject.

18,447. Do you think the investigations that have been made have gone far enough to draw general conclusions from them as to existing temperatures?—I should think so.

18,448. Is it your view that the temperature of British mines is higher than it ought to be?—In certain seams or certain mines, certainly.

18,449. Of course the temperature must necessarily depend upon the depth of the mine?—That is so.

Mr. Herbert Smith: Not necessarily.

Sir Adam Nimmo: Unless artificially dealt with.

Mr. Herbert Smith: No, not necessarily.

Witness: No, it depends upon the depth of the mine plus the temperature generated by the oxidation of the seam minus the cooling effect of the ventilation.

18,450. *Sir Adam Nimmo:* You have a variety of circumstances to take into account?—Yes.

18,451. I notice under the heading of "Temperature of Mines" you suggest that it is not desirable for you to lay down what the limit of temperature should be, but when you come to your recommendations you do proceed to lay it down?—I simply put that in because I felt certain I should be asked something on this point. I think it is a matter for consideration.

18,452. This is merely a personal view on your part?—Yes. The whole of my report is a personal view.

18,453. Then under the head of "Nationalisation" you rather suggest, I think, that while the Secretary of State has full powers to carry out such safety regulations and health regulations as he desires, he has not exercised these powers as he ought to have done?—That is so.

18,454. I suppose it is a fact that we all need probing up in these matters?—Do you mean you personally or the Home Office?

18,455. I mean the State does not seem, upon its own initiative, to go very far in these matters?—I do not think it does anything with regard to improvement in the working conditions of mines.

18,456. You do not suggest it merely stands and looks on, do you?—Well, I think it does, and if I may I will support that statement by reading from the Act. According to section 86, paragraph 1, of the Coal Mines Act of 1911, it says: "The Secretary of State may by order make such general regulations for the conduct and guidance of the persons acting in the management of mines or employed in or about mines as may appear best calculated to prevent dangerous accidents and to provide for the safety, health, convenience and proper discipline of the persons employed in or about mines." This was in 1911, and since 1911 I am not aware that the Secretary of State has done anything to improve the working conditions of mines with regard to either temperature or illumination, or with the object of reducing the number of diseases which undoubtedly arise out of the employment.

18,457. You think he could have done a great deal more if he had been active in the matter?—I am sure he could.

18,458. Is not a State Department very much in the position of an employer in this matter; that it merely acts upon the force of public opinion that is brought to bear upon it?—It may be so.

18,459. And would the employer under the influence of public opinion be just as likely to go as far as anybody else if left free?—I think in certain instances, yes, but one wants a general raising of the standard throughout the whole industry.

18,460. Is there not a different outlook upon industry generally since the war took place?—Yes, I think there must be.

18,461. Are not the employers themselves more alive to all the necessities of the case since the war developed?—I think so.

18,462. Do you not think the new spirit which has been created will carry industry as far as can be reasonably expected?—I am not so certain, unless those responsible avail themselves of all the information that they can obtain.

15 May, 1919.]

DR. FRANK SHUFFLEBOTHAM.

[Continued.]

18,463. You rather suggest the State has not done very much, but it has been left to itself in that direction?—I think it has done hardly anything in this direction.

18,464. You are not here to suggest that the nationalisation of the mines is going to bring about this position?—Oh, No!

18,465. You do not express any view in that direction at all?—No, I do not.

18,466. I take it that the question of health is not one that is confined to the mining industry. Is it your view that it should be dealt with on particular national lines?—No. I think the health of the miner is something quite distinct from the health of work-people employed in other industries. It is the only industry where over one million men are employed, and it is the only underground industry, and I suppose one might say that it is the pivotal industry of the country.

18,467. If there were a Public Health Department, could there not be within that Department concentration upon the special problems of mining?—There could be, but probably it would not be as satisfactory as if these questions were dealt with separately.

18,468. Could they not be dealt with separately in connection with such a Department?—I am not sure. I have not very much faith in these Government Departments.

18,469. Do you mean none of them?—Not very many of them. I would like to illustrate it by the way in which tuberculosis was dealt with by a Government Department. That was brought under the Local Government Board and was put under the supervision of medical officers of health, who are not experienced in the clinical side of tuberculosis, with the result that the treatment of tuberculosis has been a failure throughout the whole of the country.

18,470. *Mr. Evan Williams*: In your recommendations you give a temperature of 77° Fahr., wet bulb, as the maximum which you would permit. I want to ask you whether it is the actual wet bulb temperature or the difference between that and the dry bulb temperature?—It is the difference between that and the dry bulb.

18,471. So that you would say a temperature of 77° wet bulb with a dry bulb of (say) 82° would be worse than a wet bulb temperature of 82° with a dry bulb of about 90°?—That is so.

18,472. Is it not rather a mistake to prescribe a definite wet bulb temperature in this way?—If I am bound to answer that question yes or no. I say it is, but I think the whole question is one for full consideration. I think it is a matter in which there should be some limit.

18,473. If you are going to prescribe a limit is not the difference between the wet and dry bulb temperature what you would prescribe?—But there must be a maximum.

18,474. Yes, a maximum, but not an exact maximum of this kind?—No, perhaps not.

18,475. *Mr. R. W. Cooper*: With regard to Workmen's Compensation, I do not propose to ask you any questions about that. Have you seen in the "Morning Post" of to-day an announcement that the Government have appointed a Committee on the matter?—I have not; I never read the "Morning Post."

18,476. They have appointed a Committee to investigate the whole question of workmen's compensation. With regard to nystagmus, your memorandum is exceedingly clear. I believe it is a fact that they have appointed a committee to consider the question of improved safety lamps?—I believe the Home Office hurried up last week in the matter.

18,477. *Sir L. Chiozza Money*: You realise that we have not only to enquire into the social conditions of the miners, but to try and make up our minds, if we can, whether nationalisation would improve those conditions?—That is so.

18,478. In replying to *Sir Adam Nimmo*, I understood you to say that you had very grave doubts (I hope I am interpreting you correctly) as to whether nationalisation would have any beneficial effect?—I do not think you are right in assuming that.

18,479. Would you put it in your own way?—My own view about it was this. I have no opinion at

all upon nationalisation—I want to be perfectly clear on that point. With regard to the health conditions of miners, I think that great improvement can be made without nationalisation.

18,480. But I thought you said your experience led you to have no faith whatever in Government Departments in that connection?—That is so.

18,481. Do you know anything about the work of the Ministry of Munitions?—Yes.

18,482. Would you think it true to say the Ministry of Munitions has not studied the health of the millions of people who were under it?—Certainly not; I did not say every Government Department.

18,483. Forgive me, but it makes all the difference. I am putting it to you that what we are deciding here is the relative merits of leaving mining under private ownership with a Government Department or Departments interfering with or trying to interfere with its methods on the one hand, and on the other hand the direct ownership of the mines, making a Government Department directly, and not by way of interference, responsible for the conduct of the industry. Can you not see a very clear distinction?—Quite.

18,484. May I put it to you that that is entirely the difference which has obtained between the conduct of the Home Office in regard to health in mines, and, secondly, the conduct of the Ministry of Munitions in relation to the factories for which it was directly responsible?—That is so.

18,485. If that is so—and this is the point at issue—would not that rather lead you to revise your opinion?—I cannot say yes. One is dealing with conditions in times of war, and the other is dealing with conditions in times of peace.

18,486. Dealing with a mine, it means of course that the men have to be congregated together or segregated almost from the rest of the population sometimes, and it requires a certain number of men to work the mine. Now take the Holytown Mine. 430 were employed there. There were 107 two-apartment houses, one storey, brick-built, with no damp proof course and no garden and the scullery used as a washhouse, no boilers, and there were 36 pail privies and 18 open ash-pits. Can you imagine any Government Department allowing those conditions to obtain?—No, and I do not think any coalowner, if he were building afresh, would be allowed to do that.

Sir Adam Nimmo: These houses belong to my own company, and I submit that the statement made by *Mr. Robertson* is absolutely incorrect and untrue.

Mr. Frank Hodges: It is in evidence taken on oath.

Sir Adam Nimmo: It may be, but if you call for the facts to-day you will see they are quite different. That report is in 1910, and these houses were all reconstructed before the war.

Chairman: We will call a witness as to that, if you will let us know the witness you desire to call. *Mr. Hodges* is quite right. Of course we entirely accept your statement, and no doubt it is perfectly accurate, but as a matter of order *Mr. Hodges* points out that that has been given on oath, and we had better call some one to deal with it.

Sir Adam Nimmo: Yes, it will be brought out by one of the witnesses later.

18,487. *Sir L. Chiozza Money*: Now remember what mining is. You have to build houses. You said in reply to *Sir Adam Nimmo* that it was a national question. I put it to you that houses in connection with miners are something more than a national question. They do pertain to the mine, because of the need to bring people together for the purposes of the mine, and therefore the housing becomes almost, as it were, part of the direct operations of the mine?—Yes.

18,488. Does that not also lead you to modify the opinion which you expressed in concurrence with *Sir Adam Nimmo*? It is a national question, I agree, but does it not bear upon the operations of the industry as in many industries it does not do?—It does to a large extent, but, on the other hand, what you say would apply to other industries—to furnace work or pottery work; the people have to live somewhere, and they live as near to their work as is convenient.

18,489. But this is a case where you have, as it were, rather suddenly to bring together a number of

15 May, 1919.]

DR. FRANK SHUFFLEBOTHAM.

[Continued.]

men to work in a particular industry, as the Government had to do or thought of doing—and, I put it, will still do it—at Chepstow?—Yes.

18,490. Have you been to Chepstow?—No.

18,491. Do you know what the Government did there?—No, I have only read in the papers what they have done.

18,492. It is a pity you did not see it yourself without reading it only in the papers. Do you know both at Chepstow and Bletchley there are beautiful garden cities—I saw them in November last. They were erected then, and they are beautiful garden cities of the latest type. That is another Government department doing exactly what you know the Ministry of Munitions did in connection with similar work. Wherever it had occasion to bring workpeople together, it did it under circumstances of appalling difficulty with regard to labour and material, but nevertheless it housed the workpeople to the best of its ability?—Quite so.

18,493. Have you ever known that to be done save in the rarest cases by private employers?—No; of course there are Port Sunlight and Bourneville.

18,494. Are not they the rare exceptions?—Quite so.

18,495. No matter what political party were in power, do you not think if a new pit was sunk, say in Sussex or Kent, and a new field was discovered, that the Government would put up houses, and good houses, for the people?—I do.

18,496. When you know the conditions which you yourself have denounced here, do they not amount to a denunciation of the industry in that respect as carried on?—Do you mean at the present time?

18,497. Yes, or any time within the last 20 years?—It is a reflection, but I do not know that one ought to denounce the industry any more than the general public for allowing such conditions. I think the responsibility is at the present time, and has been for years, on the local public authorities who have not risen to, even when these matters have been brought before them, and have not taken advantage of, the powers they have.

18,498. Is it possible for a local authority to deal with matters of housing that can only be dealt with in a regional way. Is it not a fact that in relation to mining districts you ought not to put up houses in the districts of the Local Authority, but they ought to be put up with proper transport accommodation to the mines?—That is so.

18,499. How could that be done by the Local Authority?—The Local Authority has power to close insanitary houses.

18,500. Again and again have they not tried to bring pressure to bear on mine owners with unsatisfactory results?—In the last few years that is so; it is because building operations have been suspended.

18,501. Are you not able to make up your mind about this after your knowledge of what has been done by the Ministry of Munitions. Do you doubt less would be done by the Minister of Mines?—I cannot say I have considered that question.

18,502. Have you looked at the evidence of Dr. Collis?—Yes.

18,503. Do you know he said he could get things done more quickly with national factories than with private factories?—I saw that.

18,504. Let me bring you to the point to be decided at this Commission, the question of interfering with industry on the one hand and the owning on the other. If you wanted to take care of a house which do you think would produce the best results? Do you think it would be better to own the house and to have your own servants in it, or, on the other hand, for the house to be owned by somebody else with that person's servants and you could only interfere by way of making rules and sending an occasional inspector?—The first condition of things.

18,505. You blame the Home Office. What is the Home Office doing in regulating over 3,000 individual mines owned by 1,500 different colliery companies, owned by all sorts of people, some responsible and some respectable, others not at all responsible—what would you do without an army of inspectors to go to every mine once in every three months?—They could do a great deal by creating public opinion.

18,506. Do you know the regulations sent round were neglected again and again. They sent round these formal notices and they have had no attention?—I am not aware of that.

18,507. Do not you know the dreadful accidents that occurred within a short period of the Home Office making an attempt to make the mine owners do things; the Inspector has been there and said do it, and they take advantage of the law and do not do it, and that is followed by a dreadful accident?—I am not sure of that.

18,508. Is it not what you would expect to occur under a system of interference?—I am not sure of that. What I feel is there is a good deal of, I will not say carelessness or callousness on the part of the employer and the men. I think there is a personal anxiety on the part of every individual to make the working conditions as perfect as possible. There has not been the force of public opinion behind the industry to raise the standard along the lines I have suggested.

18,509. You yourself have had examples to-day. You heard the one-roomed house defended here by a Coal Commissioner after sitting on this Commission, which has gone on for weeks, yet you have faith in public opinion to act in that manner.

Sir Adam Nimmo: I did not defend single-roomed houses. I referred to certain facts in connection with them.

18,510. *Sir L. Chiozza Money*: It was put that a one-roomed house was good enough for young people and old people?—I think it is monstrous.

18,511. Yet you still have faith in a policy of interference?—I think the word "interference" is your own.

18,512. Is not the Coal Mines Act an interference?—It says what you must not do.

18,513. It is entirely a system which does its best so far as it can by writing down on paper to say there must be this, there must be that. If explosives are used they must be used under certain conditions; the managers must have certain conditions. The State does not directly own its own house and in this matter puts its own house in order?—It does not. This is a kind of policeman's job.

18,514. If that book were to be carried out you would not want 100 inspectors but several thousands. If you were to get anywhere near carrying that book out as written in the letter and spirit in which it is written it would need thousands of inspectors and well-paid men and able men both physically and mentally to see that it was carried into effect. Is it not common sense that it is so?—I am not sure of that, if you get personal responsibility in each mine.

18,515. Do you get personal responsibility in each mine. Is it not the fact there is evidence to show things are neglected? Is it not the fact that accidents have occurred again and again because of neglect? Do not you urge that?—I do.

18,516. Think of our present inspectors. You blame the Home Office. What is it to do? Is it to put up a new palace in Whitehall to house a tremendous staff of clerks to receive thousands of reports from inspectors to see that this Act is carried out?—I hope not.

18,517. You yourself, after considering this, say you hope not. I say it is the only way to get it done.

18,518. *Chairman*: Your questions, Sir Leo, are very long, and the witness does not get an opportunity of putting in even half an answer. Your remarks are very valuable, but we want to get answers. Dr. Shufflebotham, do you know what the last question was?—No, I do not.

18,519. *Sir L. Chiozza Money*: You have 3,000 mines, and do you really think that those mines could be thoroughly inspected from year to year with the present number of inspectors?—No, certainly not.

18,520. How many do you think it would want?—The evidence I am giving to this Commission only deals with health questions. I want that to be perfectly clear, and I do not want to give opinions on things I do not know and do not understand.

18,521. I do not doubt that. Yet you said in your evidence you had no faith in Government depart-

15 May, 1919.]

DR. FRANK SHUFFLEBOTHAM.

[Continued.]

ments, and you blame in your *précis* the Home Office for what it has done?—For what it has not done.

18,522. I put it they cannot do more with their given material?—I think they can. The Home Office has known with regard to miners' nystagmus that it is the commonest occupational disease known, and I cannot find out how they have tried to diminish the disease in any way whatever. There is another group of diseases known as beat hand and beat knee. That has not been considered at all. I consider the Home Office are the people to have brought these subjects before somebody and to have done something or to have suggested something to diminish the amount of suffering produced, and the amount of incapacity for work. I give those as two illustrations.

18,523. Have you noticed in that particular class of disease the Ministry of Munitions did make investigation—take T.N.T. poisoning?—I agree.

18,524. It is the difference between the department which is subject to interference and a department that has direct responsibility. That makes all the difference in the working of the people in the department?—That is exactly the reason why I believe the Home Office are not the people to carry this out, because it is a kind of super police office.

18,525. There we come to agreement?—I believe myself that a better condition of things would accrue from the Ministry of Mines with a Medical Department, the head of which should be a responsible director of the Ministry.

18,526. Do not you think there would be great difficulties if the Ministry of Mines did not own the mines and was not in the real sense of the word responsible for what it owned?—That is a matter I have not had time to consider.

18,527. Do not you think it has been rather proved in the war?—There is no doubt with regard to factories and filling stations where very dangerous occupations have been carried out the Government has been very fortunate in the method of management.

18,528. *Mr. R. H. Tawney*: First as to your statistics, you compare the disease rate among miners with that among all occupied males. That is a perfectly correct statistical method. It is the ordinary way to compare the rate amongst part of the aggregate with the rate amongst the aggregate itself?—These figures are taken from the Registrar General's Report.

18,529. That is the thing done every day by all statisticians?—Yes.

18,530. I think you point out with regard to this, the rate of sickness due to respiratory diseases must be taken as being very high among miners, and is a set off in a way against the disease of phthisis, which is low?—I put it clearer than that. My view is this, that up to very recently there have not been the opportunities of making a correct diagnosis in many chronic respiratory diseases. With the new information that has been obtained through using more refined methods of diagnosis, a great many cases that were supposed to be simply chronic bronchitis or asthma are really tuberculous in origin.

18,531. That is to say, there is a ragged margin between the two?—There is no ragged margin when a proper and systematic examination is made. Suppose a man is examined with a stethoscope, it is impossible to ascertain in a great many instances whether he is suffering from bronchitis or tuberculosis. If his sputum is examined bacteriologically you can say definitely. If his chest is X-rayed one can say decidedly what is the correct diagnosis.

18,532. Is what you mean that when the correct diagnosis is made, the rate of disease from phthisis would be rather higher than now appears?—That is so.

18,533. The low rate of phthisis must not be taken at its face value?—That is so.

18,534. You point out mining is a selected industry. By that, you mean, in the first place, it recruits stronger boys for the mines?—Yes.

18,535. In the second place, it involves exhausting work, and therefore the age at which men leave it is comparatively low compared with other occupations?—That is so. One must bear in mind that one out

of every six or seven miners is injured every year, apart from those that are killed. Many thousands are incapacitated in some way or another and they do not return to the mines.

18,536. The consequence is an elimination of the weaker men in favour of the stronger?—Yes.

18,537. To draw the conclusions from the health of the latter would be as reasonable as to take the health of the population by the health of the men in the Army?—Or football players.

18,538. They are a highly selected class?—Yes.

18,539. You gave some figures about infantile mortality. Can you tell us what the causes of that are. I understand infantile mortality is higher in the textile districts and the mining districts?—That is so.

18,540. About the textile districts, we have our own opinion; what about the mining districts?—I think in the mining districts it is due, probably, to two causes: the housing conditions and large families. There is a high birth rate amongst miners, and, if the housing conditions are poor, it operates against the children, and with the large families the children do not have much individual attention.

18,541. You say houses ought to be adapted to families and not families to houses?—That is so.

18,542. Could you particularise a little more as to what you mean about the housing conditions? When you say bad housing conditions, do you think of the percentage of overcrowding?—I think of the whole question. The question is not only the number of rooms, but the sanitary conditions, whether the windows open or not or whether the only ventilation is through the front door. One is entirely on a very big question.

18,543. Have you considered how far the special requirements of the miners' occupation aggravates the bad housing conditions? A miner gets dirty, and has to wash at home. If there are three men in a family washing at home, then that is less healthy?—No. I think I said to Sir Adam Nimmo that I thought that whilst the housing condition of the workers in this country was in a deplorable state it was all the worse for miners, because of the dirty nature of their occupation.

18,544. Would it not be true that the nature of the miners' occupation exposes them to special disabilities?—Yes.

18,545. And if those special disabilities are met, there ought to be special housing precautions?—That is so.

18,546. Would you say one of those precautions was facilities for washing away from home—baths at pit head?—Yes.

18,547. With regard to the obligation as to housing, I do not know if you are dealing in your paper with the administrative question or merely with the effect. Several questions have been asked about them. There was put to you that there was an obligation on the local authorities, and that the owners had no obligation at all?—The owners have, certainly, an obligation as well as the local authority.

18,548. You know North Staffordshire?—Yes.

18,549. In North Staffordshire a good many of the mining villages are isolated?—That is so.

18,550. When a pit has been opened there arises a special need to house the miners?—That is so.

18,551. If it were to be met by the local authorities that would involve a special expense over and above the general expenditure on housing conditions?—Yes.

18,552. On the other hand, the pit is opened primarily for the profit of the company engaged in the industry, and is it not reasonable it should make a special contribution?—I think so.

18,553. Let us take this question of pit baths. It was said better houses might be forthcoming if the miners demanded them or would pay for better houses. Do you think it would be reasonable to say that rotten fish would not be sold if people were unwilling to pay for it? You are aware the law punishes the selling of rotten fish if people are willing to buy it or not. Is not the position of houses rather analogous to the position of rotten fish for food?—I think it is.

18,554. It ought to be punished in the same manner. The same obligation rests on the vendors of houses

15 May, 1919.]

DR. FRANK SHUFFLEKROTHAM.

[Continued.]

as on the vendors of fish if they deal in inferior articles?—I think that is so.

18,555. You point out the number of accidents has not diminished since 1893. Then you go on to say that we really cannot measure the effect of the accidents by the death roll?—Yes.

18,556. You have to measure it not only by the death roll but the permanent incapacity roll?—Yes.

18,557. You say that amounts to something like 12,000 a year?—I mean to say at the end of one year there are 12,000 miners that have not recovered from accidents sustained during the previous year.

18,558. Who are incapacitated for a year or more?—That is so.

18,559. Is it your opinion or not that the number of accidents could be diminished?—I think it is, on the lines I suggested to Sir Adam Nimmo.

18,560. I have forgotten for the moment what they wore. Would you kindly repeat them?—I hope I shall say exactly the same thing. My view is that there should be a review of all conditions—

18,561. I remember now. Your point was that the accidents should be published?—Yes.

18,562. I was very interested in that. I have often felt the same thing. Is that what you mean: that the figure as to these accidents with the names should be published?—I think the number of accidents which occur week by week or month by month at each pit should be published, not only in Government reports, but in the public Press.

18,563. It would be a good thing to publish it on the walls of the large towns in mining districts, for example in Yorkshire or Staffordshire?—It would be enough to publish it in the "Staffordshire Sentinel."

18,564. You would bring it to the public notice?—Yes, and there would be competition; and although the working conditions in mines vary a great deal and the working conditions in the different seams in the same mine, I think it would really lead to a competition between one mine and another with a view to diminishing the number of accidents.

18,565. Have you any other proposals about accidents?—I believe myself in an improved miners' lamp. If the men could see what they were doing better than they do at the present time it would materially reduce the accidents.

18,566. Then you would advocate the publication of accidents and improved lamps? Are there other things?—Yes, I mentioned that there should be a periodical review of all the precautions necessary to diminish the number of accidents in mines, so as to bring up to a higher standard the general safety precautions.

18,567. Does that mean a quinquennial inquiry, or something like that, or even at shorter periods? Is it your opinion that the precautions which are now actually adopted are the maximum which our knowledge and scientific progress could enable you to adopt?—It is impossible to say. I feel sure that at certain progressive mines in this country they are doing something in one direction and something in another to diminish the number of accidents, and this knowledge should be made public.

18,568. You say the temperature of the mines ought to be regulated in the same way as the temperature is regulated in weaving sheds?—That is so.

18,569. Could you explain that more exactly as to what you have in mind? Do you mean the law should fix the limits with regard to the atmospheric conditions?—I think so.

18,570. That you think is practicable?—I think the whole matter is one for consideration especially in view of the technical difficulties in each mine.

18,571. You think it very relevant to the question of health?—Yes.

18,572. It has been done already in certain industries?—Yes. I was very much struck a few years ago in visiting a seam where I was told the temperature was over 90 degrees. I went into that seam and six or eight people were working there. The temperature, I think, was 90 degrees Fahrenheit with the dry bulb and over 80 degrees with the wet bulb. I took the temperature of each man at meal times. He had just had his meal or was about to commence

to work. I found in each case the temperature was over 100 degrees and the pulse rate was over 100. I thought it was a very bad thing for the workmen to be working at such a high temperature with such a high pulse rate when the whole of the conditions could be improved by ventilation.

18,573. You make certain proposals at the bottom of page 2 of your *précis* with regard to the treatment of men who have been disabled. One is an increase in the amount of compensation to be granted. In the first place, suppose extra facilities for treatment were forthcoming, do you think men would take advantage of them or not?—I think they would take advantage of them.

18,574. That is to say it is really a matter of providing facilities and getting the men accustomed to use them?—That is so. Within the next three months there will be in every large centre of England facilities for the treatment of discharged soldiers by massage and electric treatment provided by the Ministry of Pensions. I understand within three years there will be no necessity for these arrangements for discharged soldiers, but there will be the necessity for the civil population. It seems to me that those institutions should be available for miners and other workers who are injured in this way.

18,575. The argument that men or women would not be interested in using facilities is trivial; it is a matter of habit?—I think at the present time the view with regard to the treatment on the part of workpeople is altogether changed. They are anxious to get well in the shortest possible time.

18,576. Now about compensation. You know one of the reasons why workpeople very often do not desire to have prolonged treatment is the financial burden it imposes upon the family?—Yes.

18,577. I do not mean by the doctor's bill, but by being out of work?—Yes.

18,578. The ordinary workmen cannot afford to be ill?—That is so.

18,579. Do not you think one way to encourage him to take the treatment he ought to have is to remove these financial obstacles?—Yes.

18,580. And make it financially possible for the workmen to get treatment and be off work exactly in the same way as it is possible for the well-to-do?—Exactly.

18,581. Has not that a very important bearing on the question of health?—I think so.

18,582. Do not you think many workmen return to work when they ought to be in bed?—Yes.

18,583. Are you afraid in those circumstances of malingering?—No. I have had long experience of diseases and accidents among the mining population. I do not think there is any fear of malingering amongst them to any greater extent than amongst the general community.

18,584. You bring some criticisms against the Home Office which I, personally, was very glad to hear. What is your complaint? What do you want them to do which they have not done?—I think I have already pointed that out to Sir Adam Nimmo and Sir Leo Money. I do not wish to repeat myself. The only thing I would like to say which I have not said is with regard to the fact that they never had any Medical Department at the Home Office Department to deal with the health conditions of the miners, and it seems a *prima facie* case against them for not taking any interest in the matter.

18,585. You are in the Ministry of Munitions?—I am finishing up.

18,586. You have large experience of getting provisions with regard to health and welfare introduced into firms of different kinds?—In connection with the production of poisonous gas.

18,587. That is hardly a provision for health?—Yes, it is. The manufacture of poison gas is the most dangerous of all occupations.

18,588. Do you find any difficulty in getting provisions for health carried out or do you find one type of firm was more easily dealt with than another, or that a Government department or private enterprise was more ready to take it up?—The nature of the employment was so dangerous that every one was anxious to do what was possible.

15 May, 1919.]

DR. FRANK SHUFFLEBOTHAM.

[Continued.]

18,589. *Mr. Herbert Smith*: Did I understand you right in reply to Sir Adam Nimmo that coal owners were anxious to adopt better lighting?—If one puts a general question to them, "Do not you think that something ought to be done to improve the lighting of pits," they say, "Yes." If one says further: "Are you prepared to do everything possible," they say, "Yes."

18,590. Have you heard about strikes taking place because the owners refuse to put electric lights in?—Yes.

18,591. Do you know from experience that where electric light has been introduced there has been improvements?—All I can say with regard to the introduction of electric light is this: I have made enquiries from friends of mine who are mining engineers and they believe the electric lamp can be used within certain limitations, but it cannot be used, of course, as the miners' safety lamp is at the present time. An experiment has been made at one of the collieries in North Staffordshire where the owner was anxious to test the comparative merits of electric lamps and a good class oil safety lamp, and that experiment is still going on. He is of the opinion that up to the present time the electric lamp is much superior to the oil safety lamp he has been using.

18,592. *Sir Arthur Duckham*: Is that a little lamp?—Yes.

18,593. It is not a general scheme of lighting?—No.

18,594. *Mr. Herbert Smith*: Am I right in saying that the majority of cases you get of nystagmus is men working at the face?—Yes.

18,595. Would the electric lamp prevent nystagmus?—I do not want to pose as a specialist on lamps. The only thing as far as I can see with regard to the great disadvantage of the electric lamp is its weight. I feel certain that is a matter that could be got over.

18,596-7. I am not counting on you to be an expert on lamps. Have you not seen the table of results between using the electric lamp and the ordinary safety lamp?—Yes.

18,598. So you know it has reduced nystagmus by 35 per cent. in five collieries?—Yes.

18,599. Yet at one colliery we had to have a strike to enforce it?—That is so.

18,600. Have you had any case of nystagmus come under your observation that has ended in insanity?—A considerable number.

18,601. Is that on the increase?—I cannot say.

18,602. Have you had any experience with regard to men that have been suffering from nystagmus and have partly recovered and indemnity companies and insurance companies have refused to re-employ them again when they wanted to get light work?—I think that is so. I think it is probably on medical advice because a man who has got nystagmus ought not to work in the pit again.

18,603. I put it to you, is that so?—I do not know about that.

18,604. I want to put to you the cases I am trying to put are not on medical advice, but it is with regard to indemnity companies and the Coal Owners' Association's orders to the managers that the miners are not to return to the mine?—If you say it is so, I will take it from you. I do not know of any case.

18,605. I can produce letters. Is it not usual for owners when the man is incapacitated to refuse to take him back to do work?—I do not think it is.

18,606. Especially when 25s. for compensation is only equal to about 12s., is all he can get for the full amount?—That is so.

18,607. Do not the insurance companies and the indemnity companies try to do it so as to force a man to accept a lump sum to clear him off?—It is possible.

18,608. The indemnity companies are as bad as the insurance companies. You know the indemnity companies are colliery owners?—I understand what you mean. I have only had experience of one of them, and I cannot speak as to any others. I will say with regard to North Staffordshire the Mine Owners' Association deals very fairly with the men.

18,609. Do I understand you to say that you put it that colliery owners as a rule are willing to provide for special treatment free?—Again I say as far as my experience goes I have known many cases where this treatment has been provided free.

18,610. Have you not known of cases where they refuse it?—Quite.

18,611. You know more where they refuse it?—Quite.

18,612. Have you read Doctor Haldane's and Sir John Cadman's evidence with regard to what was happening in certain coalfields in Yorkshire where the men were working in a temperature as high as 111 degrees?—Yes, I have seen that report.

18,613. 82 degrees was common?—That is so.

18,614. And men were suffering from boils brought about by this?—That is so.

18,615. I am hoping some good will come out of your paper with regard to this. Now with regard to the local authorities and their powers, is it your general experience that local authorities in mining areas are largely composed of colliery owners, the managers and their officials, and they send out orders to the men to make them believe that the rates will go up 1s. in the pound if they do so and so?—I think there is a great deal in what you say.

18,616. Did you ever know miners refuse to pay for good houses fair rents? Would you call this a fair rent for houses being built in Yorkshire that cost about £150 pre-war where they are paying from 6s. 0d. to 7s. 0d.? Is that a fair rent on £150 for house, rent, building and everything and the miners are paying 6s. 0d. to 7s. 0d. a week, and they are paying the rent?—Does that include the rates?

18,617. Yes, is not that a fair return?—Yes, I think so.

Sir Arthur Duckham: What sized house is this?

Mr. Herbert Smith: Two rooms and a lean-to downstairs as we call it, and three bedrooms made out of two rooms. They would have made two good bedrooms, and they have made three out of it.

Sir Arthur Duckham: How long before the war were they built?

Mr. Herbert Smith: Between 1908 and 1912.

Sir Arthur Duckham: It is an extraordinary price, that is all.

Mr. Herbert Smith: It would not be a bad rent pre-war from 8s. to 8s. 6d. with four bedrooms?—No.

18,618. The miners are willing to pay a fair rent unless there is an agreement that the colliery company should provide like they do in some counties and pay very much less wages?—Yes.

18,619. In Durham and Northumberland they pay indirectly for their houses by getting less wages?—Yes.

18,620. Sir Adam Nimmo shakes his head. Could you tell us what is the difference why a Yorkshire miners should get a minimum wage of 7s.? I am talking about a base rate, and the Northumberland and Durham miners get a base rate of 5s. 6d.? Suppose I suggest a reason to you; you need not accept it?—If you suggest to me and also suggest they get their rent for nothing I suppose that explains it.

18,621. The point I am going to make is this. They get their coal free and they get their rent free in Northumberland and Durham. In Yorkshire we pay rent and pay a small acknowledgment for coal. A Durham and Northumberland miner is as good as a Yorkshire miner?—I suppose the difference is explained by the free rent.

Sir Adam Nimmo: You do not deal with Scotland

Mr. Herbert Smith: In Scotland they may do worse than that.

18,622. With regard to these other things. Do you think that there is anything in the question of causing accidents to men through hurry and scurry in mines on account of their being on contract work? There is a bit too much of pushing men on?—Yes I think so.

18,623. Do you think it would reduce it if contract work was abolished?—It might be so. That is a question I would sooner not give an opinion

15 May, 1919.]

DR. FRANK SHUFFLEBOTHAM.

[Continued.]

upon. I think the general speeding up in a pit conduced to an increased number of accidents.

18,624. *Mr. Frank Hodges*: I was interested in your paper where you make what I understand to be a useful practical suggestion on page 3. Apart from the question of nationalisation with which I believe you are not particularly interested you say, "Should nationalisation come about or not I strongly urge that, there should be a Ministry of Mines with a Medical Department, the head of which should not be in a subsidiary position (as the Medical Adviser to the Factory Department is at the Home Office) but that he should be a member of the Minister's Council with free access to the Minister." You put that proposition forward based on the inefficiency of the present machinery for coping with the health of the miners?—That is so.

18,625. You rather supplement that by your argument as to the treatment of miners suffering from nystagmus. The Chairman did not read this last night because he thought we would all read it carefully ourselves. I notice there you make a comparison as to the cost of the compensation to workmen who are suffering from miner's nystagmus?—That is so on page 5.

18,626. You say, "I have no actual statistics to hand with regard to the total cases of compensation for this disease in the whole country, but feel sure that it may be estimated at somewhere about £1,000,000 per annum." In the other paragraph you say that the cost of putting in suitable lamps with sufficient candle power to give proper illumination would be somewhere in the nature of £1,250,000?—It has been estimated at that.

18,627. Although you appreciate the fact that that would be an initial cost and the lamps so purchased in one year might have a life of three or four years?—Quite.

18,628. Taken over a period of three or four years you could, according to your suggestion, providing you have the lamps purchased, save in actual money, or putting it in another way in the process of time you would save on that expenditure all the misery which accompanies nystagmus to miners?—That is so.

18,629. I gather that the cause of nystagmus is due to inefficient light?—Absolutely.

18,630. That, you think, would be the proper field for investigation by such a minister as you propose, the Minister of Health?—That is so.

18,631. That is to say, if this department specialised in the health of the workmen they could on investigation come forward with propositions which, although they were of a financial character and would mean a considerable cost either to the State, if they owned the collieries, or the employers—you think they should come forward with those propositions with power to enforce them?—That is so.

18,632. I want to come to that. Have you thought out in what sense this Ministry would be empowered with authority to enforce a decision as to the health of the men?—My view is this. If there was a Ministry of Mines, and a council to advise the Ministry of Mines, the head of the Medical Department should be a member of that council so that he could bring directly to the knowledge of the Minister points such as I raise in this memorandum. I feel sure that if, we will say, the Miners' Federation considered the matter in the same light there would be sufficient force behind it to bring about such a desired change.

18,633. That is how it would appear to one looking at it just casually. Does not that imply the Minister of Mines must himself be a person who through his department can give legislative effect as it were to any proposals you put forward?—That is so.

18,634. And that presupposes the creation of an institution that does not now exist. There is no Ministry of Mines now?—It does presuppose that.

18,635. In order to have an effective Health Department you presuppose a new Ministry of Mines coming into being?—That is so.

18,636. Because you consider the existing machinery is not adequate to deal with your proposals?—Quite so.

18,637. Would that department provide, or is it contemplated that it should be provided with moneys to engage the best specialists in medicine and surgery that money could obtain?—Exactly.

18,638. That in turn would have to depend upon Treasury sanction?—Yes.

18,639. The Ministry of Mines would have to put it to the Treasury that this Health Department of ours must have a considerable amount of money to carry out our proposals?—Yes.

18,640. In short, your proposals looked at from the health point of view would involve a drastic rearrangement of the form of control in the industry?—Quite so.

18,641. Would it, as part of its work, look after the housing and the sanitation of the workmen?—That is a point I have not considered.

18,642-3. I think you linked that up with the most interesting data on page 2 with reference to the housing of miners. I wondered whether you had in your mind that it would include the housing of miners in this suggested Health Ministry of Mines?—That is a point that I have not considered. I have only mentioned the housing conditions in reference to its general relationship to the health of miners. With regard to the housing question I do not know as yet, and I have not made up my mind, whether the housing of miners should be dealt with by the proposed Ministry of Mines or brought within the general housing scheme affecting the whole nation. I think I should be inclined to take the latter view.

18,644. If it could be ascertained that the housing of the miners presented a peculiar problem as distinct from the housing of the working classes generally—if it could be established that this was a peculiar problem due to the nature of the occupation and situation of the mine, would you then make provisions for the Medical Department to deal with the housing of miners?—I would consider the point.

18,645. I feel sure your mind is perfectly open upon that. For a moment, dealing with the question of houses, you give in your *précis*, on page 2, quotations from the reports that have come from the Counties of Midlothian, Linlithgow, and four others, including Lanark. You say, out of 33,355 houses occupied by miners, 18,582, which is equivalent to 55.7 per cent. of the whole, are only two-roomed tenements, while 3,866, or 11.3 per cent., are only two-roomed dwellings. We thus see, of the mining houses in these counties, 67 per cent. of them have either one or two rooms. Do not you consider that that is a startling revelation of the housing conditions of the miners in those counties?—I do, and I say so.

18,646. Have you lived in the country at all?—No.

18,647. Have you ever had anything to do with the breeding of pigs?—No, I have not.

18,648. Have you ever had it brought to your notice, in rearing its family, in fact, even with a single pig, it has a two-roomed dwelling? Are you aware of that?—I cannot say that I am.

18,649. Let me put it to you. Are you not aware, when a pig-sty is built, even a pig-sty of 30 years ago—there are more modern ones now—there is a cot for the pig to sleep in and an outside railed-off area for it to eat in?—That is so.

18,650. Would you say, then, if that is the condition of swine in the country, that the miners who have been compelled to live in these one-roomed dwellings in which they live, sleep and eat, are worse housed than swine?—It appears the conditions are—I would not like to make the comparison quite so strong, perhaps—but it is a most deplorable condition.

Sir Adam Nimmo: I think the Scottish people will resent your insult.

18,651. *Mr. Frank Hodges*: If *Sir Adam Nimmo* or anybody on this Commission lends himself to the suggestion that the talk of the one-roomed dwelling is sentimental talk, what position would you place such a man in, with the full knowledge of the facts before you?—I should not attach very much importance to what he said.

18,652. Would you think he was a fit and proper person to look after any body of workmen?

Sir Adam Nimmo: Is that a fair question?

Chairman: I did not quite gather what it was.

15 May, 1919.]

DR. FRANK SHUFFLEBOTHAM.

[Continued.]

Sir Adam Nimmo: It is most irregular.

Mr. Frank Hodges: I will repeat it. I was asking the doctor if he was aware of how swine were bred in this country, and whether he was aware that the breeding of swine involved, at least, the erection of pig-sties for the pig to sleep in and one to eat in, and I suggested that if there were workmen or families living in one-roomed dwellings, the inference is they were worse housed than swine. Then, I proceeded to ask if there was any member, *Sir Adam Nimmo*, or any member of the Commission, who would lend himself to the suggestion that the talk of the one-roomed dwelling which has been talked about was mere sentimental talk, was he a fit and proper person to have the destiny of workmen under his control.

Sir Adam Nimmo: The reference was specially to myself. I was merely referring to facts. I certainly think I am entitled to your protection, sir, against any such insinuations made.

Chairman: I do not think there was any insinuation made by *Mr. Hodges*. I think we all agree that would be a very deplorable state of things. I am sure it was not meant to refer to any particular coal-owner.

Sir Adam Nimmo: I submit the words could only have that effect. If *Mr. Hodges* says they did not, I am quite content.

Mr. Frank Hodges: All I say is *Sir Adam Nimmo* quoted an eminent doctor named *Wilson* with apparent approval.

Sir Adam Nimmo: He is the Medical Officer of Health for Manchester.

Mr. Frank Hodges: I put this question, as far as I know, to a doctor of equal, if not superior, qualifications.

18,653. Dealing with compensation you say: "It may be said that if the weekly payments of compensation be increased, it is an inducement to malingering or exaggeration of symptoms. In my experience, working men who are disabled through injury and who can claim compensation are no more likely to exaggerate their symptoms than patients we find in better circumstances in private practice."

18,654. What do you mean exactly by that?—I mean to say this, that as soon as one suggests an increase in weekly compensation, it may be urged on the part of the employer or insurance company that it is an inducement to malingering on the part of the disabled workman. I maintain that it is not. Speaking from a large experience of all classes, my opinion is that workpeople who are disabled by accident, or incapacitated by industrial disease, are not more likely to exaggerate the symptoms than people in better circumstances.

18,655. You are aware that the maximum amount of payment now is 25s.?—That is so.

18,656. Are you aware that that represents somewhere about 11s. 6d. in purchasing power?—That is so.

18,657. Are you not surprised that the workmen who are embraced in the Miners' Federation of Great Britain have not taken some form of drastic action to support the claims of these unfortunate men for a higher compensation rate?—I am surprised.

(The Witness withdrew.)

Mr. Herbert Smith: I should like to ask whether it is possible to get statistics from each district of the number of men suffering from nystagmus?

Mr. EDMUND MILLS HANN, Sworn and Examined.

Chairman: I need not introduce you to this Commission. I will read the *précis* of your evidence. *Mr. Hann* says:—

"I have been engaged in coal mining 53 years, of which the last 40 years have been spent in South Wales.

During that time very great advances have been made in every one of the chief operations involved in coal mining, and particularly during the past 14 years, in the application of electric power.

18,658. Would you be surprised to learn that one of the reasons why the Miners' Federation of Great Britain has not embarked upon a strike in order to raise these men's amounts during the war has been that they were very largely animated by patriotic reasons?—I have no doubt of it.

18,659. Are you familiar with the fact that an application has been made to the Government by way of deputation for an increase in the compensation payments?—Yes.

18,660. But nothing has been done, I regret to say, as a result of that. Can I gather as a general proposition that it is your view, apart from the money value of 25s., that when a man is incapacitated through accident he really requires an added income to supply him with those necessities that are requisite for him to have a speedy recovery?—That is my view.

18,661. In short, that he ought to have more money while incapacitated than while working?—I would not go so far as to say that, but I believe that he should have better treatment provided for him and a considerable increase in the compensation.

18,662. *Chairman*: I wanted to ask you one question that I have been asking *Sir Richard Redmayne* about: is it your view that there ought to be a sort of medical inspector in addition to what I might call safety inspectors?—I should think that if there is a medical department connected with the suggested Ministry of Mines, the safety inspectors would be dealing with engineering problems, whereas the medical officials would be dealing with purely medical questions.

18,663. Would you have local medical officials?—Certainly. I think there should be a medical official attached to every mine, and there should be provision made at every mine for the treatment of accidents and illnesses which arise at that mine, and something more than the first aid ambulance arrangements that are provided at the present time.

18,664. What is your view of convalescence arrangements?—The consideration of the development of a medical department would certainly involve provision being made in that respect. In my view at the present time there is not sufficient provision made by either local enterprise, or in other ways, for the convalescent period of miners who have been disabled.

18,665. What about things like electrical massage treatment: what is your view with regard to that?—I believe that in every colliery district there should be instituted something like an orthopaedic clinic as is being established in every district for disabled soldiers, where a disabled miner can come under proper conditions of electric treatment and massage and whatever treatment he requires for the special complaint from which he is suffering. At the present time I understand that clinics are being arranged throughout the whole country by the Ministry of Pensions, and I am told that they will be available not only for disabled soldiers, but for the civil population. If these institutions are utilised by the mining industry, I feel sure that it will be to the advantage of the disabled man.

Chairman: I am much obliged to you for the assistance you have given us.

Chairman: Yes, that shall be got.

15 May, 1919.]

MR. EDMUND MILLER HANS.

[Continued.]

good steam engines, more especially when it is a case of substitution, and that cost has to be borne in mind, as well as the shorter life of electric apparatus generally.

There is undoubtedly a saving to be made by the complete electrification of collieries driven from large power stations, but it is by no means as great as seems to be generally supposed. Whilst in the North of England there have existed large power supply companies, only one was formed in South Wales, and unfortunately for the district it started on wrong lines and never offered a cheap supply, and to this bad start I attribute mostly the fact that electric plant at South Wales pits has been behindhand, and progressive concerns have installed their own plants. Due regard to the enormous capital cost involved in altering the drives of existing machines, especially winding engines, does not seem to be taken. In most cases of shafts deeper than, say, 250 yards, an entirely new winding equipment would be necessary, and there is rarely an alternative site to the existing one available. In the case of new projected collieries, of course, there is a clean slate, and most of these difficulties will not exist.

In dealing with the problem of increasing production or economising production in face of shorter working hours, particularly as affecting South Wales conditions, it should be recognised that it is a wholly different and more difficult and slower thing than speeding up a factory. It does not seem to be appreciated that owing to the presence of a feature peculiar to South Wales, viz.: the occurrence of what are termed "slips," together with the softer nature of many of the beds in the strata, increases the difficulty created by the heavy pressure of the strata on the formation and maintenance of large roomy pit bottoms, also the fact that there is quite a disproportioned increase in the cost of maintaining roadways of an increased area is a serious obstacle, and it is not only the cost, but these repairing operations on the main roadways are always liable to interrupt the passage of coal along the roadways. It may be taken as generally correct that the mechanical haulage appliances on the pit bottoms and main roads are sufficient to maintain approximately the full output in practice obtainable over such roadways. It is found in practice that there are several limits to the rates at which coal can be conveyed over a piece of road, which is determined by the speed at which the journeys may run and the time required for changing ropes, shunting, etc., and the weight of journey. The maintenance of track underground cannot be compared to that of a railway, the continual squeeze and movement of the floor and the timbering render the upkeep of a real good road underground an impossibility. For this reason the speeds of the journeys cannot in most cases with safety be considerably increased beyond those now used.

In the case of the Powell Duffryn Collieries, with the exception of certain cases in which collieries and districts are not fully developed owing to local causes, no substantial rate of increased output per hour can be obtained except by increasing the winding power, pit bottoms, and the number of main roads leading towards the shaft, and these must necessarily be extremely slow in construction. I think they are fairly typical of South Wales and therefore, whilst improvement can go on it will necessarily be slow, and slower than in some other coal-fields, as well as more expensive, and will delay the speeding up in the winding and haulage which are, of course, prime factors in the output of most mines.

In the collieries I am intimately acquainted with I find that the amount of electricity consumed per ton of coal produced varies in two instances of single collieries from 10 in one to 32 in the other. Neither of them does its winding by electricity, the latter uses face conveyers largely, and differences in general conditions account for the rest of the difference.

In the Powell Duffryn case with which I propose to deal more fully, the firm's 12 collieries are in two groups, of 7 in the Aberdare Valley and 5 in the Rhymney Valley; the two groups are 8½ miles apart, the units consumed per ton of coal raised upon an

output of 3,800,000 tons is 20, but the winding is only done to the extent of 20 per cent. by electrical machines, the haulage, ventilation and pumping are almost wholly electric where the use of power is permissible. The collieries being heavily watered, the pumping load is very great, and 35 per cent. of the total units generated are absorbed in that way there are 5 tons of water raised per ton of coal got. The total consumption of coal was reduced betwixt the years 1902-1909 from 6 per cent. to 3½ per cent. Since that time increased depth and the introduction of cutting machines and conveyers has caused a gradual increase in the percentage, which for the last year was 5.2 per cent., but I estimate that if the collieries were on their full output it would not exceed 4½ per cent.

All that remained of the old steam plant has been removed of recent times, and it is now of a high class, and would not repay for electrification. 24,000 k.w. of electric generators have been installed, mostly turbines of 500 to 5,000 k.w. capacity, and coke oven gases and exhaust steam are utilised as far as reasonably practicable.

In coal cutting, experiments with four or five classes of machines have been going on for a dozen years, but not quite 10 per cent. of the output is machine cut, in spite of our having scrapped the older types and adopted the turbine driven chain machines; this slow progress is due chiefly to three things, firstly, most of the coal seams contain slips or breaks every foot or two, and thus loosen the coal, a feature peculiar to South Wales (and in the other coal districts confined generally to areas adjacent to faults). Secondly, the weight or crush is far greater at equal depths in South Wales than in any of the other fields, thus rendering far more face timber necessary, and increasing the difficulty of safely maintaining the necessary space for the machine, likewise other troubles in the faces. Thirdly, the fact that small faults or dislocations are so much more numerous than in other districts, and so frequently prevent the development of or interrupt the progress of a face. A less frequent trouble is the presence of water which, however, is sometimes absolutely fatal to the attempt to use the machines. I do not therefore anticipate a great increase in machine cutting in South Wales, except so far as it may facilitate the working of thin seams that have really good roof, and in course of time this is bound to come about.

The introduction of face conveyers which has been going on also for about a dozen years has resulted in better types of machines replacing those first tried, and is more hopeful than cutting, and has been extended until at the present time quite one-third of the output is being got by help of face conveyers, and they promise greater results in the near future I think, in South Wales, than the coal cutter.

In the Powell Duffryn Collieries there is now a length of 11,453 yards of face worked with the help of conveyers, producing 26,000 tons per week. The advantages gained by conveyers are, firstly, the reduction of the amount of ripping in roadways, i.e., shooting of roof or bottomstone to make height, and an important consequence of this reduction in what is usually termed "dead work" is a reduction of shot-firing and its risks. Secondly, the faces advance more rapidly, and thus the workman gets sooner under freshly exposed roof and leaves sooner behind him that which is breaking as the result of the removal of the coal, thus improving in safety, likewise it produces a much more even subsidence, and damages any overlying seams of coal much less, and, Thirdly, it reduces the length of travel of the air currents, and simplifies the ventilation. Fourthly, makes more room for rubbish in the face, reduces the amount brought along the roadways, also makes haulage easier by concentrating the output of say 100 yards of face instead of 14 yards of face in one road.

The introduction of these has been a very slow and difficult matter, and even more slow and difficult has been the training of men to use them so as to obtain economic advantage from them, and the result shown above of approximately 2½ tons per week per yard is

[15 May, 1919.]

MR. EDMUND MILLS HANN.

[Continued.]

not nearly what it ought to be, and will be, when the last feelings of opposition have died away.

They require a large power supply, in our case owing to questions of safety, it has to be compressed air, and involves a large and expensive installation of air compressing engines and pipes.

The satisfactory working and organisation of face conveyers underground is much more difficult than appears evident, and they require much more initiative, skill and foresight on the part of officials than the ordinary longwall method of working.

At some collieries where the question has been properly studied, and the management have the necessary skill and experience, they are successfully worked, but in the hands of those who do not use them properly, no saving in cost is achieved, and they have discarded them in many cases.

The latest colliery sunk by the Powell Duffryn Company was near Pengam and called Britannia, it was commenced in 1911 and reached the Upper Ras Las Seam, at a depth of 700 yards, in 1914, and commenced working coal at the same time as the war commenced, its development has consequently been somewhat retarded by war conditions, the output for 1918 was 500,541 tons. It was sunk and has been operated entirely by electric plant placed at adjacent collieries and has no stationary boilers. The underground faces have been opened entirely by the use of face conveyers, and there are no horses at all underground. The seam varies a good deal in thickness, but the average is about 4 feet, the yield per yard of face per week in this colliery is 3 tons 13 cwt. or an improvement of 58 per cent. over the average of the whole of the conveyor faces in all the pits, and 114 per cent. over stall work. This is due partly to the faces being straighter and longer lengths, which favourable condition is in turn due to there being fewer faults. It is one of the few pits in South Wales that send out no rubbish. The figures work out thus:—

	Tons.	Cwt.
Output per yard of face per week in stall work	1	17
Output per yard of whole of the conveyers	2	6
Output per yard of Britannia conveyers	3	13

The coal consumption is 3.62 per cent. at this pit, of which air compressing needed for conveyors mainly takes up about 27.01 per cent., and the pumping of large feeders of water consumes 30.02 per cent.

One of the main items of expenso in South Wales pits is the maintenance of roadways, and the effect upon this cost of increase of output per yard of face is a direct and important reduction of the total cost. The total output of this pit since its commencement has been over 1,800,000 tons, and there has been seven fatalities underground altogether, showing a production of 260,000 tons per fatality, whereas the average of South Wales appears from the statistics to be 170,000 tons per fatality underground.

The company took a lease of another area adjoining in 1915, and has commenced a little of the surface work preparatory to sinking a pair of shafts thereon for the same seam of coal, which will be about 500 yards deep, and it is purposed to work that colliery on the same system as Britannia."

That is very interesting and valuable evidence, I may say. But as it is technical I will ask the two members from South Wales to ask you questions—Mr. Evan Williams on one side and Mr. Frank Hodges on the other.

18,666. *Mr. Evan Williams*: Your proof is so clear and explicit on the points you have touched that I am not going to take up the time of the Commission by putting questions even to emphasise any of the points that you have drawn out. I think I am right in saying that you have been too modest to say that you are the pioneer company in South Wales in the introduction of mechanical improvements in collieries?—I think we have done perhaps more than anyone else, and I think we began some of these things earlier than anyone else.

18,667. Throughout the whole of the progress that you have made you have contributed to the general

knowledge of the district in mechanical engineering appliances?—Yes. We started using electrical power, of course, long ago—about 1885 or 1886—first of all for lighting, and then for small pumping and that sort of thing. In those days we only had the direct current, and it was only in 1903 or 1904 that we really had the 3-phase alternate current advocated, and we adopted it immediately, and put up a power station which has been steadily extended ever since. That power station consisted originally of some 1,500 kilowatts, but as you see now it is 25,000 kilowatts in two power stations in each valley. They are inter-communicated by an overhead main line, so that in case of interference with the work of one or deficiency in the output of one it may be separated from the other.

18,668. You have given the coalfield the full benefit of your experience as you have gone on?—Yes.

18,669. You have not kept it to yourselves. You have readily communicated all that you have done in the coalfield?—Yes; there have been several communications.

18,670. In that direction is there any reluctance on the part of mining engineers in South Wales to communicate their ideas to one another and give one another the benefit of their knowledge?—I think not. I think the Institution that is there, which is affiliated to the general mining industry of the country, has proved of great use in circulating to each other information with regard to improvements of various kinds both from the point of view of economy and safety of working, and has done a great deal of good in that way.

18,671. That is an impression among those who perhaps have not had the opportunity of gaining experience of colliery working that it is possible to extend the use of electricity very largely underground. Will you tell the Commission your view as to the extent to which electricity can be used underground?—Underground in South Wales it is very strictly limited by the presence of explosive gas or the possibility of its presence, and also by reason of the collieries being very dusty, many of them. There are many situations where we should be very pleased to use it, and would use it if it were deemed to be proper and safe.

18,672. So that the use of compressed air is very largely necessary on that account?—Yes, we have to use compressed air from motives of safety, and that, of course, excludes electricity in most of the collieries from the internal parts, and confines it to such machines as can be put moderately near to the pit bottom and in the main currents of fresh air.

18,673. While it is possible to centralise the generation of electricity for a certain number of pits or for an area, it is not efficiently possible in the case of compressed air?—No; there are very great objections and difficulties in the way of making central stations for compressed air, although I think a little more can be done than has been done in making central stations to cover quite a small range. I do not think you can, except with very large loss of efficiency, carry it to a very great distance.

18,674. And generally speaking the compressors are at the surface?—Yes; generally the compressors are at the surface, because they are large machines; and in South Wales the difficulties in maintaining any large space underground are very great.

18,675. In your view it is as economical to compress the air for each pit by itself as it would be for the distribution of it in the area?—Yes, except in large collieries.

18,676. Would you tell us your view as to the possibility of the extension of mechanical haulage at points nearer the surface in collieries in South Wales?—We have a good deal of variation in the gradients to deal with. The coalfield is not quite so level as some of the others, and, therefore, we are obliged in many cases to put haulage machines away in the interior parts of the colliery where it would not be necessary if the field were less disturbed and more regular, and those machines have to use compressed air for the reason stated already, namely, safety.

15 May, 1919.]

MR. EDMUND MILLS HANN.

[Continued.]

18,677. Is it possible in every case to take mechanical haulage nearer to the face of the working?—Mechanical haulage by electricity?

18,678. By any mechanical means—either by compressed air or electricity?—Of course, compressed air involves ranges of pipes, which are very inconvenient down the pit. It might be said to be possible, but in very many cases it would be a very great expense.

18,679. Would it be efficient or economical in all cases?—Compressed air, of course, is as a rule highly inefficient from a mechanical point of view.

18,680. Even if horses are necessary in most pits and even hand putting?—Horses are necessary in South Wales because our trams are of a larger size and of bigger weight than are used in many other districts; therefore the difficulty of handling them by hand is much greater and there is less of it done for that reason, but when smaller tubs are used, of course, there is much more hand putting done.

18,681. Where tubs can be handled by hand, dependent on the number that can be, it is possible that hand putting is the most economical way of doing it?—Under certain conditions undoubtedly, but that does not apply to the district where our collieries are situated.

18,682. It does not apply to South Wales, because the trams are too heavy for the men to handle?—Quite so.

18,683. It does not follow that because men push or pull tubs that that is an inefficient and uneconomical method of working?—No, not at all.

18,684. And because horses are used to pull trams it does not follow that that is an uneconomical method of working?—Not at all.

18,685. We have had it put at this Commission several times that a pit which is of a small size with a single cage is an uneconomical way of working. Would you tell us your views as to that?—That largely depends on the field of coal to be won. There are many cases in which the field of coal is split up by important faults or may be in other ways circumscribed very much, and in those cases large pits are not required and would be simply a waste of money.

18,686. It depends on the circumstances?—Yes, it depends on the circumstances, which vary in almost every case. There are no two collieries alike.

18,687. So that there are cases where a small pit with a single deck cage and a small winding engine would be the most efficient and economical way of working it?—Certainly.

18,688. Unless you have a large output and the seams are thick enough to give a big output, it is unnecessary to put down big cages?—It is a question very much of depth. In a shallow depth a small machine will do as much work as at a greater depth a bigger machine and bigger appliances will do. It is where the depth increases that these things become more necessary and more economical.

18,689. You give in your proof three reasons to show why the use of coal-cutting machinery is not extended more rapidly in South Wales. Is there not a fourth reason that might be attributed to the attitude of the men in the pit?—Yes. There has been a good deal of opposition to the coal-cutter. That is getting less.

18,690. There has been in the past?—Yes, very great opposition; but I must say it is getting less.

18,691. And it has been opposition apart from the question of price?—Yes, I think so.

18,692. No doubt the financial question has operated in the minds of the men as well?—Yes.

18,693. Has it not been the experience in South Wales generally that the men have asked the same cutting price for the coal when machines are being used as when they have been cutting by hand?—Yes, I think there have been a good many instances of that.

18,694. You bring out quite clearly that in South Wales it is not possible to have the same extension, owing to the physical condition of the seams?—The condition of the coal in the seams does not lend itself to it as well. When you cut the coal you are very liable to get your coal jammed, because it gives way at these slips, and without a good deal of care it is liable to jam your machinery and stop your work.

18,695. In the case of conveyors, they are more extensively applicable than the coal-cutting machines?—I find it so.

18,696. Do you find that your example has been followed very largely in South Wales?—Yes, there are a good many conveyors going in now.

18,697. Given co-operation on the part of the men, it is a system which will produce coal more efficiently and more cheaply in most cases in South Wales?—Yes, in a great many cases. I think I might say that we have put in (during the war, of course, there were many difficulties in the way of getting material) practically as many as we could.

18,698. You have had a good deal of experience of the use of electrical lamps underground, I believe?—Yes, we have a large number in use.

18,699. Will you tell us what your experience has been with regard to them?—It is favourable experience so far as everything except cost is concerned. They are a good deal more costly, but we favoured them, and put in a large number, and we would have had a good many more, except that for a long time during the war we had great difficulty in getting any at all, or even in getting the necessary parts for repairing these in use.

18,700. During the war there has been a great deal of trouble with electrical lamps, for that reason?—Yes: the inability to get the parts to keep them in repair—it has been a very serious difficulty.

18,701. Have you had any experience of the use of the combustion tube in the lamp?—Yes, we have had a good many. They give a better light than the old oil lamps.

18,702. Is it your view that there has been any reluctance on the part of coalowners to get a better light underground?—No. So far as the people I have been in contact with are concerned, there has been a continual effort on the part of mining engineers to get the best light they could.

18,703. Has it not been the limitation of the type of lamp that may be used that has kept the illuminating power of the lamp down very largely?—Yes, there have been difficulties in combining the two things—getting increased safety and increased light at the same time. Of course there have been a tremendous number of types of different lamps invented and tried, but that has been one of the chief difficulties that has prevented better lamps being put in. That has been gradually overcome, and I consider that there are better lamps available today, both of the oil description and of the electrical, than there were before.

18,704. Is it your view that colliery owners recognise that it is both to their financial advantage and from the point of view of safety to get as good light as possible?—Yes, that is my view. I think the colliery owner is fully cognisant of the fact that it is better all round to have a really good light.

18,705. He gets cleaner coal?—Yes, he gets cleaner coal and better supervision of the roof. A man gets a better view of the roof, and can keep himself more safe.

18,706. We had a good deal of evidence yesterday, and there was a good deal of cross-examination upon the question of the method of the long wall working, the advancing method as against the retreating method. You have had experience, I take it, of both methods, the one in Durham and the other in South Wales. Would you give the Commission your views as to the practicability and the advantages of the retreating system?—

Mr. Herbert Smith: May I ask, what do you mean of the retreating system?

18,707. *Mr. Evan Williams:* You know what I mean by the retreating system: advancing your roads in the solid out to the boundary and working your coal back as against the other method of working your coal away as you go forward?—I do not see how that can be adopted, very well. Many collieries that have now been in existence for many years are not at the boundary yet, and if they have to wait to open their face for that length of time, no one would sink a colliery at all.

18,708. Quite apart from the financial question, taking South Wales, is it practically possible, as a method of working, in a large number of instances?—Quite independently of the financial question?

15 May, 1919.]

MR. EDMUND MILLS HANN.

[Continued.]

18,709. Yes?—Of course, anything is possible, but I do not see that we would be advantaged by it at all.

18,710. In South Wales is it not the case that roads driven in the solid are more difficult to maintain generally than roads in the gob?—Yes; advancing roads in South Wales in the weaker roofs are a terrible trouble; in fact, we have had many instances where we have been unable to maintain them at all, going on in the solid. They cut up by the sides, and then the whole weight of the superincumbent strata comes on the timber, and you have to be continually renewing the timber, and you cannot make any progress.

18,711. While there may be advantages for a seam liable to spontaneous combustion, do you think there is no danger of spontaneous combustion?—No, I can see no advantage. As applied to mining in our district, the thing is not feasible at all.

18,712. It is no indication of an inefficient system of working that we have not adopted generally the retreating method of working long wall?—That is so. I fail to appreciate what points are supposed to be gained by the system of going out and coming back again.

18,712A. *Sir L. Chiozza Money*: Do you refer to South Wales only?—I do.

18,713. *Mr. Evan Williams*: You have some acquaintance with other districts in the country, I believe. Do you see any advantages in other cases?—My experience in Durham, in the North of England, is long ago: there was very little long wall working at that time in the district, and, therefore, my experience does not extend to it. There was a system of board and pillar in which the coalfield was cut up into convenient rectangular forms, and you went out to the boundary of that piece and came back, but that was on the double working system, not long wall.

18,714. I think that is called the panel system?—Yes.

18,715. In other districts would you say that there are any advantages to be gained by driving out to the boundary?—I should say there are not, and I have not come across at all any attempt to do so.

Mr. Herbert Smith: Will you ask him what other districts he has visited?

18,716. *Mr. Evan Williams*: What other districts have you visited?—I think I have visited, at one time or another, most of the coal districts, but I do not profess to have any intimate practical acquaintance with any of them.

18,717. Except South Wales?—Except South Wales.

18,718. There is one point, and it is a very important one that you have not touched on in your proof. It is the question which at this stage the Commission has to deal with, and that is the question of nationalisation. I should like to ask you what your view is with regard to nationalisation in respect of matters upon which you have been called to give evidence here, that is to say, the possibility of increased efficiency in the mechanical equipment of the mines. Would you give us your view as to the effect that nationalisation would have upon that point?—I think that nationalisation would have a crippling effect. A private owner and his engineer are very much more likely to originate improved methods and carry them out than a Government Department. These things that are mentioned here, as I have said, are really experiments that have occupied many years, and if they had been tried and dropped without a great deal of perseverance, there is no doubt that they would have been condemned entirely.

18,719. A good many experiments that you have made in different ways in mechanical engineering in your collieries have been failures to start with?—Yes, certainly.

18,720. A good deal of money has been spent in that way upon things that have proved futile?—Yes, we have always encouraged our lower officials to try experiments and see what they could do, as well as putting into force one's own particular ideas. We have always encouraged that, and we have tried lots of things which have not proved to be a success.

18,721. By your Board of Directors you have always had encouragement?—Always.

18,722. And no complaints as to the money spent in experiments of this kind?—No, none at all.

18,723. Is there any way in which, in your opinion, there can be increased efficiency in the working of collieries in South Wales, for instance, in the direction of forming special groups, or groups of a certain size, or anything of that kind?—I think for the purpose of electrification, especially, the formation of groups of a fairly considerable size is a decided advantage. A group of the kind that is mentioned here is in a better position than a small isolated colliery.

18,724. With regard to pumping, the same thing might be said?—Usually a colliery does not want to share its difficulties as to water with other people, and it has to do its own pumping, but a central station would just compare as favourably on pumping as it would with the electrical apparatus, that is, that a mine, instead of putting down a plant to its own particular pumping, might get power from that central station and do its pumping, not by power generated by itself, but from the station, but that would have to be a cheap supply. I look upon a colliery as a customer of an electric station that can never afford to pay high prices for electricity. The supply must be a cheap supply, if the colliery is to use it.

18,725. Assuming there were some methods of unification adopted, what is your view of the size of the unit that is most efficient?—The unit of machinery or the unit of management?

18,726. The unit of management?—My experience is that as you extend, even if there are no fresh difficulties come in, wherever it may be, whether it is the head man, or the second man, or the third man, he gets more and more propositions put before him to settle. Each one of those takes a certain amount of time and attention, and if there is too much put upon him, he breaks down or he cannot give the requisite attention to settle the problems as they come up. That applies to an extension, even if it is unaccompanied by any fresh complications; but, as you extend, there is always a tendency to have fresh kinds of difficulties as well as more of the same kind. You get fresh kinds of difficulties turning up.

18,727. Your view is that the most efficient unit is that of a size in which one man can be sufficiently aware of all that goes on?—Yes, over which he can maintain a real supervision.

18,728. A real personal supervision?—Yes.

18,729. *Mr. Frank Hodges*: Am I to gather from your addendum in the last paragraph that the futuro of the South Wales coalfield lies with the development or working of expended seams?—No, I did not intend that. In the course of time, of course, we must come to thinner seams, and in those thinner seams the coal cutting machines will undoubtedly come in, and that is not a matter of the present so much as it is with the conveyor, which can be adopted now and in the immediate future. When you say the last paragraph of the addendum I think you must have made a mistake. The last paragraph is with regard to the lease of another area. I think you referred me to the wrong part.

Mr. Evan Williams: It is at the top of the first page, not in the addendum.

18,730. *Mr. Frank Hodges*: Quite so. What you say there is: "I do not therefore anticipate a great increase in machine cutting in South Wales, except so far as it may facilitate the working of thin seams that have really good roof, and in course of time this is bound to come about"?—I think I should have made it more clear if I had said within a short time, within a small number of years. Undoubtedly it will come about, but I meant to convey that it would be a considerable time because we have still a very large quantity of thick coal to work in most collieries.

18,731. Would you say as an expert that, looking into the future, not so very far, but looking into the future somewhat, that the majority of future work in the South Wales coalfields is going to lie in the development of the working of thinner seams than those that are being worked now?—Yes, undoubtedly that will come on gradually. The method was and is to work the best seams first, and then, as they become

15 May, 1919.]

MR. EDMUND MILLS HANN.

[Continued.]

exhausted, the various collieries will have to go to inferior seams in thickness and quality and in other matters, and the coal-cutter will have a futuro. They have been very much improved since we started on them, and one does not know how much they will be improved. If they are very much improved, that of course may bring the time of their adoption very much nearer; but taking things as they are at present, I meant to convey that there is a large field for the conveyor at the present time and in the immediate futuro; whereas the coal-cutter is more a matter of some distant time.

18,732. There is a saying amongst the Welsh miners that the cream is being worked out now. I thought that that was the inference that you wanted to draw here. Perhaps it was not. Coming to the question of the conveyors, you know the statistics that have been published with reference to the conveyors. I see in South Wales for the year 1916 there were 137 conveyors in operation, which was a higher number than any district in the coalfield, including Scotland?—Yes.

18,733. Yorkshire is the next highest, with 125?—I do not think they need them as much as we do.

18,734. They are there in the majority: you agree with that?—Yes. I think we have as many conveyors ourselves to-day. What was the number you mentioned?

18,735. 137?—I think that is about the number we have at present.

18,736. Coal-conveyors alone?—Yes.

18,737. Apart from what has happened at other collieries, that number which was for the whole coalfield, and is now in the Powell Duffryn, does it not indicate any opposition to the introduction of conveyors?—I am free to state that, whereas in the early stages it was very considerable, it has been reducing. It is the natural inclination of a miner to like to do his work in the same way as he was doing it before.

18,738. That applies to a great many institutions?—Yes.

18,739. With regard to the coal-cutting machines, did I understand you to say that there was some opposition to their introduction?—Yes, a good deal.

18,740. I think you and I were interested in a little dispute some time ago, were we not, about the introduction of one at the Meiros Colliery?—I think you are wrong; I know nothing about the introduction of it.

18,741. Did you not advise them on it?—No. You are probably thinking of my son.

18,742. I find that the opposition to the introduction of a machine there was that the colliery company were anxious to reduce considerably the cutting price, I think, to the extent of 5d. a ton, because they introduced a coal-cutting machine and conveyor as against the old hand-cutting system?—Very likely.

18,743. I think it would be true to say that that characterises a great many objections to the introduction of coal-cutting machines, where they can be worked?—Yes.

18,744. Not so much in opposition to their being used, but to the wages that can be earned by them?—That wants qualifying. There has been a good deal of opposition because the men did not like the working of the machines, and it naturally follows that when the machine does the hardest work and cuts the coal, the work of the removal of the coal is very much less, and therefore demands a lesser price. It did not reduce the amount of work to be done, it is hard to see what inducement there would be for either party to put them in.

18,745. The inducement would be if you could get a greater productivity without a reduction in wages, or even with an increase in wages it would be worth while having that greater productivity, would it not?—The productivity would do some good, but there is the whole cost of the machine, and that is rather heavy, and, of course, there is a certain amount of labour in working the machine; you have to take the balance between the two.

18,746. On the whole it is estimated by every colliery manager, when he proposes to put a machine in, that the balance, if wages remain the same, will be in his favour?—He calculates that the reduced

amount of work which the collier will have to do in getting the coal, after the machine has done the hardest part of the work, will repay for the cost of the installation, which is pretty heavy, and the cost of the working of the man or men who work the machine. He may put a machine into a seam of coal, not exactly for the purpose of reducing the cost, but because the cost of working that seam without the machine would be prohibitive.

18,747. Yes, I have seen that occur in several cases myself, but I have noticed that that is the great object, to show a good balance on the introduction of the machine on the part of the manager?—Undoubtedly. He would be no good as a manager if he did not look to it.

18,748. And that that is the case of the opposition on the part of the workmen, because they think the balance is greater than he is entitled to?—I quite agree.

18,749. You have raised one or two very interesting points. I should like to deal with the question of the system of working. You were rather guarded in your reply with reference to working a colliery on the drawing back method, or the retreating system, as against the present method. Are you aware that in what is known as the South Crop portion of the coalfield, the retreating system has been proved to be the only economical system of working those collieries?—I do not know that exactly, but the South Crop collieries are mostly high gradient collieries, are they not?

18,750. Yes?—And the system of working is altogether modified. If you can go out for a certain distance with roads which will stand well, and, of course, there are seams where that is so, a road driven out will stand well—there you certainly have an advantage in the retreating system; but I am speaking from my own experience, and that is that we have not got it. With regard to our seams as a rule, the most expensive places are places driven in advance of the general face. As soon as you get in advance of the general face, you get a great increase in the expense, and the place is very difficult to maintain.

18,751. You are aware that there have been many experiments and many failures in trying to work that portion of the South Wales coalfields on the ordinary lines. If you will remember, such collieries as the Bryncethnn Colliery, the Tynywain Colliery, the Cwmdu Colliery, the Mill Pit Colliery, and the Kenfighll Colliery, they are all collieries which, because of insufficient capital, have begun to work the coal immediately they were down in the first stages. They were bound to put their coal on the market to get sufficient money to go on. Are you aware that those collieries closed down because of that very method of working?—I am fully aware that the method of working coal for many years on the South Crop was in many cases a disastrous failure, but you are ascribing it to a cause that I am not sure is the correct one. I have no doubt that in many cases people have opened out on the coal sooner than they ought to do, and I should think there are cases where it would be more advantageous to go out for a certain distance with the headings and then draw the coal back, but I could not assent to that as a general proposition.

18,752. But you know that the Baldwin Collieries are regarded as profitable collieries. Are you aware that they in each case drive their headings to the boundary, and their main slant before they go to the boundary, before they begin to drop back a single ton of coal?—I was not aware of that.

18,753. That is the fact, that they drive their heading for a thousand yards, and it is only when the thousand yards is reached that they begin to draw the coal?—If it is, it must be due to the fact that their main roads in going out will stand well and do not require so much for maintenance. It is the same as I was describing in Durham: it is a double working system. There is the first working, the whole working, then the second working, or the broken working—that is a system that was in vogue in Durham pretty universally when I left there 40 years ago. Long wall had only just been tried in two or three of the deepest pits, but if

15 May, 1919.]

MR. EDMUND MILLS HANN.

[Continued.]

that is the case, it entirely explains what you have said. If you can drive out roadways which will stand well and not incur great maintenance expenses, then in all cases it is advisable to drive out some distances, which may be panels, as they are called in the north, of larger or smaller size. That is the right way of working, but that does not apply at all, according to my experience in longwall.

18,754. A company, to do that, must have considerable capital at its disposal, or it would be wanting to draw coal at places where it is not desirable to draw it?—That is so; they must have more money and more patience.

18,755. You make rather a surprising proposition, to my lay mind, in connection with driving through the solid. It has always been an accepted dictum in South Wales that one of the best ways of maintaining your roadway is to drive through the solid and leave substantial pillars on either side?—No, that is not in steam coal. We have seams there where with 100 yards driven in that way they will take as much repairs as 500 driven in the other way.

18,756. Will that not be because there is certain coal surrounding the area that has been worked out?—No. There are seams in South Wales where if you sink a pit and start out into the virgin field of coal they will begin to squeeze directly you get 20 yards from the pit. That is due to the strata. It is unable to support the superincumbent weight.

18,757. Does it not indicate that even in such cases as that it would be better to work the pillar away and stow it?—I did so once, and it succeeded very well.

18,758. I will ask you one more question, and that is with reference to haulage. As the working day is likely to be reduced in July of this year by one hour, have you not as a mining engineer—probably you have more than anyone else—but have you not contemplated the need for getting the men from the pit bottom to the face by mechanical means as against ordinary walking?—Yes, especially where the distances are considerable. It is very much a matter of distance. On a short distance, of course, there is no object in it. It takes longer to get the men into a train of tubs and out again than is saved, but that is not so on long distances where it is safe. We have a good deal of limitation in that way where the gradients are very variable. Training the men it can, of course, be done, but it is not unattended with danger.

18,759. But in the cases where you have thought it necessary to consider their introduction has that not been rather due not so much to your foresight, as it were, thinking this problem out in advance, but because there is a contemplated reduction of one hour in the working time of the men?—I have no doubt that has influenced a great many people besides myself. We are not at the present moment in face of very long distances in our collieries, and it will not apply greatly to them, but wherever there is a long distance to be traversed it will be well worth the while of the engineer in charge to consider how he can form trains to take the men in and out by mechanical means.

18,760. So that one can arrive at this general proposition perhaps without going very far wrong, that as the workmen enjoy reduction in hours, as they get those advantages which they do not now enjoy, the economic pressure on the owners will be such as to compel them to introduce such labour-saving and time-saving devices which a year or two ago would be unthought of?—Yes, and with regard to haulage it will be a question of distances. In South Wales, owing to the trouble of maintaining the roadways, it is not so usual to have very long distances underground as in some other districts. Our distances in South Wales do not compare with the distances in many of the collieries in other parts of the Kingdom, for the reason that the maintenance of roadways is so very expensive that the areas worked by one pit and the distances to be covered are upon the whole less.

18,761. Is that rather borne out by the statistics that were offered here by the Secretary of the Coal-owners' Association of South Wales, because I see there are 20,751 men who walk one mile and under $1\frac{1}{2}$ miles? There are 4,251 men who walk $1\frac{1}{2}$ miles and under 2 miles; and you have 1,500 men who walk between 2 miles and $2\frac{1}{2}$ miles?—In those long distances, it will repay you to think it out very carefully whether a train will not save a good deal of time.

18,762. *Chairman*: I have been asked to ask you a question, and it is a question that I would not insult you by asking you personally. Supposing the mines were nationalised, do you think the State could rely on the present mine managers and officials to use their brains and endeavours to come to the assistance of the State?—I do not see what else they could do.

Chairman: I was sure you would say that. I am very much obliged to you for your evidence.

(The Witness withdrew.)

(Adjourned for a short time.)

Mr. CHARLES H. MERZ, Sworn and Examined.

18,763. *Chairman*: I think you are senior partner in the firm of Merz & McLellan, Consulting Engineers, of 32, Victoria Street, Westminster, and with offices at Newcastle, Darlington, Melbourne, Buenos Aires, &c.?—Yes.

18,764. You say in your proof: "My firm have been responsible for the technical development of the North East Coast electrical power scheme. They are also Consulting Engineers to various power undertakings at home and abroad, among which may be mentioned the Newcastle-upon-Tyne Electric Supply Company, the Glasgow Corporation, the Commonwealth Edison Company of Chicago, the Government of Victoria, South Africa and Western Australia, and also to various railway companies, including the North Eastern Railway, Central Argentine Railway, and Buenos Aires Western Railway. During the latter part of the War I acted as Director of Experiments and Research at the Admiralty"?.—Yes.

Chairman: I will now ask the Secretary to read the witness's proof

Secretary:

"I have made a special study of the economical production of power from coal. I am asked to appear before the Commission to deal with the economies which can be effected in the utilisation of coal in this country by the development of the use of electrical energy.

The saving to be effected by the use of electrical energy at the pit itself, in connection with pumping, hauling, ventilating, winding, and—in suitable pits—coal cutting, are well known and have been, or will be, no doubt, referred to by other witnesses. It may be mentioned, however, that in 1913 16,850,000 tons of coal were used at the collieries as boiler fuel. It is safe to say that the same power could be produced in a large modern station by one-fifth of this quantity of coal.

The advantages of dealing electrically with what may be called the larger uses, such as winding and pumping, depend upon the cost at which the electrical energy can be produced, and are greater in those districts where a supply of power can be obtained from a comprehensive system, whether the latter is a public supply undertaking, as in the case of the Northern Coalfield and part of Scotland, or privately owned—i.e., by the collieries themselves—as in one or two isolated cases.

The improvement of the system for the general supply of electric power throughout the country is, therefore, of special importance to collieries, for the English coalfields, with one exception, are very inadequately covered by existing power supply systems. The economy of coal which results from the application of electricity is clearly seen from the figures given in the Coal Conservation Committee's Final Report, page 67 *et seq.* In the year 1913, in the

15 May, 1919.]

MR. CHARLES H. MERZ.

[Continued.]

County of Durham, the output of coal was 42,112,181 tons, and in the County of York 41,464,471 tons. The former county is more completely covered by an electricity supply system than is the latter, and advantage has been taken of this by colliery owners, with the result that whereas the coal equivalent of the electricity used is calculated to have been 172,064 tons in 1913 in the case of Durham, the same equivalent only reached 29,318 tons in the case of Yorkshire, the output of coal of the two counties being approximately the same. The more extended use of electricity accounts to a great extent for the fact that the consumption of boiler fuel used at collieries in Durham is only 3 per cent. of the total output of coal as against 5.7 per cent. in Yorkshire, 8.3 per cent. in Lancashire, 9.1 per cent. in Scotland and 5.6 per cent. in South Wales. This seems clear evidence of the great economy which could be attained if a cheap supply of electricity from a public supply undertaking were everywhere available.

I was Chairman of the Electric Power Sub-Committee of the Coal Conservation Committee, and with regard to those questions which will interest the Commission we arrived at the following general conclusions:—

Page 8, paragraph 1.

- (1) "The coal consumption involved in the production of motive power in the United Kingdom amounts at the present time to 80,000,000 tons per annum, equivalent in value to, say, £40,000,000 at pit-head."

Note.—This figure on present-day values would be at least £80,000,000.

Page 8, paragraph 1.

- (2) "In the industrial reorganisation which must take place on the termination of the war, the further development of power is of great importance. The present use of motive power per employee is only about half that in the United States of America. Large quantities of electrical power will be required for the development and carrying on of new processes not at present undertaken in this country. Processes involving some millions of horse-power at present worked in America, Norway and Sweden, Germany, &c., can be profitably carried on, and, having in view the desirability of making all essential products in the Empire, should be carried on in this country."

Page 8, paragraph 1.

- (3) "It is only by largely increasing the amount of power used in industry (by two or more times) that the average output per head (and as a consequence the wages of the individual) can be increased. The pre-war earning power, or wages, of each individual was far too low."

Page 8, paragraph 1.

- (4) "Power may be most efficiently applied to industry by the medium of electricity."

Page 8, paragraph 1.

- (6) "Technically and economically the electrical energy can be best provided by a comprehensive system, as amply proved from experience gained in those parts of the world where such systems are in existence, notably in Chicago (Illinois), on the North-east Coast of England, on the Rand and in certain industrial districts of Germany. Power production in large super-plants, with generating machines of 50,000 h.p. or more, will not only be far more economical than in a large number of smaller plants, but will ultimately involve great economies of capital by securing a better load and a more effective use of the plant. Such super-plants, if suitably situated on large sites, would make it possible—so far as it is economical to do so—to extract the by-products in the shape of oils, motor spirit, &c., from the coal before using it

as fuel, thus avoiding to a large extent the necessity of importing them."

Page 8, paragraph 1.

- (7) "The super-plants would feed into the main trunk distribution system, which must be laid down throughout the country. For this purpose the country should be divided into some 16 districts, throughout each of which there should be a standard periodicity and trunk main voltage."

Page 9, paragraph 1.

- (8) "This main trunk distribution system would collect any waste power available wherever situated and deliver it where it could be profitably used. It would also, by saving the cost of transport, make it commercially possible to bring much coal to the surface, which is at present wasted and left in the pit, and which, under the new conditions, would be turned into electrical energy at or near the pit-head."

Page 9, paragraph 1.

- (9) "If power supply in the United Kingdom were dealt with on comprehensive lines and advantage taken of the most modern engineering development, the saving in coal throughout the country would, in the near future, amount to 55,000,000 tons per annum on the present output of manufactured products."

Page 9, paragraph 1.

- (10) "If the coal so saved were used for the production of further power it would be possible to generate continuously not less than 15,000,000 horse power (equivalent to 131,400,000,000 horse power hours), which would more than compensate for the absence of large water powers in this country and admit of the manufacture here of many products which are at present only made in America and on the Continent."

I hope that as a result of the report of Sir Archibald Williamson's Committee the Government will carry legislation which will deal effectively with the power side of the question, and so secure for the country the advantages of a comprehensive system of Electric Power Distribution.

I would emphasise the importance of a national policy with regard to one of our greatest material assets, if not the greatest, namely, Coal. We have hitherto looked upon the coal industry too much, perhaps, as merely that of getting the coal out of the ground and transporting it to the place where it is to be burnt; the question as to how it should be used is, however, equally important, and in any re-organisation of the coal industry the development of the new processes and industries, of which coal forms the basis, should be fully considered.

State or Municipal control of industry has been generally recognised as most successful when applied to those undertakings of which the technical principles are more or less settled, or which require comparatively slow technical development. It may therefore be pertinent to direct special attention at the present time to the importance of the development of the processes affecting the Coal Industry to which sufficient attention has not hitherto been paid.

Paragraph 20 of the Report on Power Supply above referred to calls special attention to the important additional advantages bound up with this whole question of the use of coal for the production of power; the following may be quoted:—

Page 15, paragraph 20.

- (3) "By locating either the main or supplementary plants at or near the collieries, much coal that is now wasted or left in the pits could be profitably utilised, and the coal which would otherwise be burned to transport the coal used would also be saved."

15 May, 1919.]

MR. CHARLES H. MERZ.

[Continued.]

Page 15, paragraph 20.

- (4) "By-products obtainable from the coal before it is consumed in the boiler furnace, or producer, could be extracted in any case where it is proved to be economical to do so. These by-products may be of as great value to the country as the fuel residuum, for nitrogenous fertilisers, crude oils, oils for marine propulsion, and motor spirit for road traction can all be largely extracted from coal."

In explanation of these paragraphs, I may say that I contemplate that in laying out a comprehensive power scheme for the country:—

- (1) Where the nature of the coal was such that it would not pay to transport it, the power plants would be erected at or near collieries. Either gas engines or steam turbines would be employed, depending upon the amount of water available for cooling and condensing purposes respectively.
- (2) The principal power plants would be steam driven, and located on sites chosen for their ample supply of water for condensing purposes, though naturally in the choice of sites due regard would be paid to the length and cost of fuel transport.

Looked at from a thermal point of view, apart from by-products used in special industries, such as those used in the dye industry and for making explosives, all coal may be looked upon as divisible into constituents of high and low energy value—

- (1) The high value constituent contains a large amount of energy per unit of weight.
- (2) the residue or low value constituent contains a much smaller amount of energy per unit of weight, and mixed with it is the dirt and incombustible matter.

The high value constituent is worth a great deal more than the low value constituent, and it is much more easily and cheaply transported, hence the correct policy is to extract the high value constituent for such purposes as air transport, motor transport, and marine propulsion, utilising the low value-constituent at or near to the collieries in large and economical central power plants where no question of transport is involved.

It should be realised that there is no process at present in commercial operation for extracting by-products from coal before it is consumed in the boiler furnace or "producer," for the production of power, which has been proved to be generally applicable for this purpose. The problem is, however, one of which a solution is already indicated by experiment and research, and when the opportunity arises I have little doubt that a satisfactory solution will be developed which is both scientifically and economically sound.

From a national point of view I anticipate that it will be possible in the future to combine with the large central power plants process plants which will extract the lighter fuels for air and motor transport, and oils for marine propulsion, leaving the residue in some form of coke for utilisation either direct or for the production of gas for the generation of electric power. Any scheme for the future development of the industry must have in mind how these results can be most quickly obtained.

I do not forget the very important gas and coke industries, but I would repeat that there is no by-product process in commercial use to-day which can be considered generally applicable to power production on a large scale—this is partly, at any rate, because, there being no comprehensive power distribution scheme for the country in existence, with large and suitable power station sites, the demand for such a process has not really arisen. Research is now being made in various quarters, and I am hopeful that a process will be developed.

It has not yet been proved that we have any considerable quantity of oil in this country; on the other hand, the importance of the use of oil for ship propulsion is becoming more apparent. Apart from the onomy obtainable by the internal combustion engine

and steam turbine plant, where oil is used in the furnaces to produce the steam, there is a great saving of labour formerly needed for coaling and stoking—labour of the most arduous kind. Further, as much less weight in oil has to be carried to perform a given journey at a given speed than where coal is the source of power, there is a great saving of bunker space, and consequently an increase in the cargo capacity of the vessel.

There is also the question of using special kinds of coals, especially those limited in quantity and of particular value for the processes for which they are particularly suited. In this connection I may call attention to the report of the Carbonisation Subcommittee of the Coal Conservation Committee in regard to the export of coking coals.

This Committee recommended, and it certainly seems desirable, that some steps should be taken to conserve for our own use our stocks of specially valuable coking coals in which other countries are relatively poor. It was reported to the Coal Conservation Committee that this coal was, and will be eagerly bought by foreign countries which use it for the production of coke to make steel, which may be sold again to us. This is not due to any special advantages which these countries enjoy for using these coals, but it is because we are neglecting to make the most of them here. If we are going to export this coal to foreign countries it seems at least desirable that we should extract the valuable by-products before doing so.

Questions such as those I have referred to should be seriously considered in determining the best organisation for the future conduct of the coal industry, as there is little doubt that we have not in the past done so much as we might have done to develop scientifically the best means of utilising our coal resources, apart altogether from the getting of the coal, and we shall certainly in the future look upon our present methods of burning coal, and generally speaking, of distributing power, as exceedingly crude.

In short, just as we are beginning to realise that it is essential that the Government of the country should have some definite policy in regard to transportation and the supply of electric power, so, it seems to me, to be equally important that there should be a definite policy in connection with the winning and utilisation of coal. By this I do not mean only the question as to whether this or that part of the business should be worked by the State or by private enterprise, but also the technical question as to how to develop the various processes in industry of which coal forms the basis.

I understand the Fuel Research Board are preparing to carry out important experiments with some or all of the objects referred to above in view, but I am doubtful as to how far any one department or organisation, however ably conducted, can cover the whole field, and I think that experiment and research should be encouraged throughout the country. No one who has had experience of attempts to deal with everything by Government control can believe that the concentration of all such development in Whitehall would be efficient.

In this connection I would call special attention to the skeleton machinery for dealing with electric power supply outlined in the report of Sir Archibald Williamson's Committee. A study of this report will show that, while not putting on one side either municipal or private enterprise in any particular district, the future management of the industry will not be centralised in Whitehall, but will rather be dealt with by local organisations in each district to be set up for the purpose. In my view some such principle should be seriously considered in the case of the winning and utilisation of coal.

The advantage of a decentralized organisation are well illustrated by some of the successful Port Authorities and municipal undertakings. The electricity supply in this country is partly in municipal hands, and there is no doubt that municipal electrical enterprise, while it has seriously retarded electrical development has, within the limits imposed by bad legislation, been stimulated by friendly rivalry between the different managers as a result of the publication of

15 May, 1919.]

MR. CHARLES H. MERZ.

[Continued.]

the Board of Trade and other statistics in the technical Press. As compared with the Civil Service, as worked in the Post Office, municipal undertakings have the advantage that they have a free hand in the choice of the best men and the salaries they pay, and thus good managers have a chance of promotion independently of age and length of service.

It would, in my view, be impossible to conduct successfully by means of a Government Department of the present type, subject to existing Treasury control, any business which is undergoing or requiring rapid development. The existing system of Government and Treasury control is largely founded on the principle that people ought not to be trusted, whereas it is well known that the best is only got out of people by giving them responsibility, trusting them and giving them considerable freedom as regards carrying out a policy.

It may be hoped that, in these businesses in which it is decided the State should take a special interest, the importance of this matter, which is very apparent to those who have had to do with Government Departments throughout the war, may not be overlooked, and that it will not be found impossible to devise a system of general, not detailed, control (some control is, of course, necessary in the case of public funds) which will attract able and energetic men and the kind of brains that are necessary for the industry for dealing with new developments.

It used to be said that Government service, on account of its security, could obtain brains at a lower price than private enterprise, but I doubt whether this is now, generally speaking, the case for the reasons indicated."

18,765. *Mr. R. W. Cooper:* As you have said in your *précis*, your Newcastle company was practically the pioneer company, was it not, on the north-east coast?—Yes.

18,766. And it has undoubtedly developed to a very large extent the use of electrical power in the Durham and Northumberland coalfield?—Yes; there is a larger percentage used there than in any other part of the country per head of the population.

18,767. And in addition to your company and its allied companies, which are controlled by your company, supplying power to the collieries in that coalfield, there are two or three, or probably more, from all I know, large colliery concerns generating their own power for their own use?—I do not know that there is any comprehensive system.

18,768. That is not my question. In point of fact there are two or three large colliery undertakings supplying themselves now with electric power generated by themselves for their own use. May I give you the names?—Yes.

18,769. The Lambton and Hetton Collieries?—They own part of the plant, but it is operated by the Power Company.

18,770. As a matter of fact, they are the owners of the power station, are they not?—They are the owners of the power station.

18,771. That power station at one time belonged to the Newcastle Supply Company, did it not?—No.

18,772. Did they not sell it to the Lambton Company?—They were an intermediary in the transfer.

18,773. At any rate, the money passed through their hands?—Yes, but I think it would give a wrong impression if I simply answered yes.

18,774. I do not suggest you sold it for the purposes of getting rid of it. This power station came into your hands, and you then transferred it to the Lambton Company, and you operate it now for them for a term of years on certain conditions?—The position really was that this is a power station which ought never to have been put up. It got into difficulties. It was not capable of meeting the requirements of the collieries, and it got into difficulties financially, and in order to avoid a shut-down of the business, which the Newcastle Company did not want, because they did not want electricity to get into bad repute, they took it over from the company which owned it. Then the question was: What was to be done with the power station, and there did not seem to be any other use than to use it partly for the

supply of these particular pits, and they sold it to the Lambton Collieries.

18,775. And it is mainly used for the purpose of their collieries?—Yes.

18,776. Do you know of any other large colliery undertakings in Durham who are generating their own power at the moment?—I know there are individual collieries which have private plant, but I do not recall the name of any one which has a large private plant.

18,777. Take the Consett Iron Company?—If you had said steelworks, I would have said yes, but I look upon them more as steelworks. I do not think they use electricity to any large extent in their collieries, or what I would call a large extent.

18,778. I will not argue it with you. If these colliery companies are satisfied with generating power at a low cost per unit, you do not contend they should not be allowed to continue to generate their own power?—No, I do not think that is the suggestion of Sir Archibald's Committee.

18,779. Have you a copy of the Report of that Committee?—Yes, I think someone has obtained a set of copies and they are available for the use of this Commission. At any rate, that was perfectly clear, and I entirely agree as one who signed the Report that there should be no compulsion upon any individual, whether manufacturer or colliery owner, preventing him using a private plant, if it paid him to do so.

18,780. I suppose we may assume that with regard to some of these colliery companies who, even since the war began, have spent large sums of money to establish generating stations so as to electrify their undertakings if they are satisfied that they can produce power at cheap rates, say a farthing per unit, you would not dream of interfering with them?—No, that is not the suggestion. Of course, you will not take it from that that I admit they do in fact generate more cheaply.

18,781. That, of course, is a question of fact?—Yes.

18,782. Dependent upon how they are equipped and what each generating power station costs?—Yes. I think if it were investigated the colliery companies would often be found to be wrong.

18,783. If they can generate power at a lower cost than they can buy it from you, they ought to be satisfied?—Yes. There should be free trade in that respect. I would not suggest it is proper to compel the individual to buy something like electricity from a source where it might pay him better to do it himself.

18,784. On the question of the relative cost of these municipalities I observe in the Report of the Subcommittee of which you were Chairman, you give a long list of municipalities in Lancashire, and you contrast their charges for electrical power with the charges of your Newcastle Company?—Yes.

18,785. And the result is, is it not, that contrasting these municipal suppliers with your company suppliers, your supply is much cheaper than theirs?—That is so; but if I may explain the object of that table was not to call attention to the relative merits of municipal and company enterprise, but it was to call attention to the different conditions under which the two areas were worked. The municipalities are working under very disadvantageous conditions, imposed by Parliament, in that particular area. It might be argued that they were partly responsible for them themselves, but they are in fact working under very disadvantageous conditions. The North-East Coast Company is working under favourable conditions for economical electricity production, and that is sufficient reason for the difference.

18,786. Do you know as a matter of fact whether, speaking generally, the charge for electricity supplied by public authorities is less or more per Board of Trade unit than the charges by the companies?—I have an impression that if you took simply the average statistics for the country, it could be shown that the municipal suppliers were the cheaper, but I think that that again would be open to misconstruction. I do not think that you can really draw any final conclusion from that. That is to say, the cost of electricity depends upon the conditions under which

15 May, 1919.]

MR. CHARLES H. MERZ.

[Continued.]

it is generated and the size of the undertaking, and so on, and the only true comparison is between undertakings of similar size and similarly situated. I think such general comparisons are apt to be misleading.

18,787. I gather from what you say that you cannot get a precise comparable comparison?—No, I do not think you could find an absolutely comparable comparison in the country. If I may explain again, the comparison of the kind you mentioned last is largely affected by the cost of electricity as supplied by private companies in London. These private companies in London supply very congested districts as regards streets and so on—the streets are very congested and they have special expenses—and I do not know that that is necessarily a fair comparison with, for instance, a municipality like Birmingham. I think that those statistics must be used with caution, just as the other ones which you have quoted from this report.

18,788. I was referring in my last question to the final Report of the Census of Production, 1907, with respect to public utility services, where they contrast the charges in the gross with the charge of the public authorities. As a matter of fact, the average rate with public authorities is slightly more than with private companies throughout the country?—I take it from you, but I think that would be probably answered by the fact that you have included the power companies among the companies.

18,789. That may be so?—I mean to say there are no municipal power companies; there are no municipal concerns supplying electricity over large areas at the present time.

18,790. I quite see what you mean with regard to that. The comparison is not a just comparison?—No, I think not.

18,791. Now I want to ask you a question about what you say as to coking coal. I suppose you are aware that there is a considerable amount of export trade in coking coal?—Yes.

18,792. Take Spain, for example, and take the port of Bilbao. Do you know Bilbao personally?—No, not personally.

18,793. Do you know there are two large iron making companies at Bilbao?—Yes, I do know that.

18,794. Who buy English coking coal?—Yes.

18,795. Why should the exportation of coking coal to these Spanish pig-iron producing concerns be in any way restricted or prevented?—Well, I think that that would be a very favourable case for showing it should not be, because, clearly, we get iron-ore from Spain, and it might be said to be economical that the ships should take back coking coal, but I would rather they took back the coke than the coal.

18,796. Supposing these people have coke ovens at Bilbao as part of their establishments, why should they not coke the coal at Bilbao?—I am speaking entirely from the technical point of view and not the economic point of view. It appears to me that we ought to do that at home. All they want over there is the coke. Why should we not take these by-products out at home?

18,797. I see, from your technical point of view, what you mean; but I do not see why the Spaniards should not be allowed to make their own coke?—Because they have not got the coal.

18,798. But we get iron-ore in exchange from them?—I had more in mind people who do not exchange iron-ore in that way. I think a certain quantity of coking coal goes, or did go, to Germany.

18,799. To be converted into coke in Germany?—Yes.

18,800. *Mr. Evan Williams:* You concerned yourself more with the consumption of coal than with the production of coal?—I do not attend as an expert in getting coal at a pit at all.

18,801. You do not express any opinion upon that?—No.

18,802. You mean you can get the same power in the country by less consumption?—That applies to power at the collieries also.

18,803. In the case of a colliery you say that the determination ought to be made as to whether the present steam plant should be substituted by electric plant on the ground of the consideration of the comparative cost entirely?—I do not object to that.

18,804. Notwithstanding that more coal has been used to produce the power at the colliery, and if by so doing it produced its power cheaper than buying power it would be cheaper for the colliery to burn its coal?—I agree. As a matter of fact it would pay the colliery to convert in every case if there was such a comprehensive power system.

18,805. Is not this the case? If there was a comprehensive power system there would be cheaper power available for the colliery to buy?—That is the reason.

18,806. Further the comparison would be made between the cost of buying power and the cost of generating the power at the colliery?—I think so certainly.

18,807. If this scheme of utilisation of coal is brought about, to have an outlet for the present output of coal there would have to be a considerable extension of the use of power in this country or an extension of export?—Do I understand you to ask me whether if there was a saving of coal by this comprehensive system it would not be necessary to export more in order to keep up the present output?

18,808. Yes?—I think that would only be a very temporary affair. I do not believe as a matter of fact that the output of coal in this country will go down for one minute. I think we can get this additional 15,000,000 horse power or part of it from the same coal, and we shall use that in industry. The development could not take place so quickly but that it will be absorbed in the use of additional power.

18,809. You speak about the location of plant at collieries as being desirable. I take it a supply of water for condensing purposes is of more importance than nearness to the colliery?—That is so, except where the coal is of such poor quality that it will not pay to transport it at all.

18,810. That is very rare?—I understood that in cases where coal in the past has been dumped you can hardly call it coal, but there is something to be got out of it.

18,811. In order to bring about this new department your view is that some new system of Government Administration must be devised. Nothing that we have in Government Administration at the present time will be satisfactory in your opinion to carry out the development scheme you aim at?—I did not say it must be. I did not say it would not be possible to do it without Government assistance. All I said was if it is decided to do it by nationalisation in my opinion a centralised, what is called Whitehall Department, would be the wrong system of administration.

18,812. You speak of devising a scheme. I suppose you mean a new system, a departure from the present method?—The present ordinary Government Department system.

18,813. That is for the utilisation of coal in these power stations and the distribution of coal?—My remarks apply generally to any industry requiring great development.

18,814. Would you regard the coal industry as a proper one for a Government experiment?—In regard to a new system?

18,815. Yes?—If they are going to experiment in some industry I do not know I would object to some area of the country being attempted.

18,816. *Chairman:* Or some particular country or some particular area in England?—Yes.

18,817. *Mr. Evan Williams:* Take the comparison of industries. Would you select the coal industry to be the first to be experimented upon in that way?—I would certainly select it prior to a manufacturing industry.

18,818. An industry carried on underground rather than one carried on on the surface?—I would.

18,819. As far as production of coal is concerned for experiment, would you experiment on the country as a whole?—I think it would be a great pity to experiment on the country as a whole. I do not see there that you have any comparison. May I quote from what I know more about; that is the case of electricity. I think the suggestion to have the country divided up into areas and have each area complete

15 May, 1919.]

MR. CHARLES H. MERZ.

[Continued.]

in management and technical development is good and will lead to comparisons between districts, and we shall work as a whole. We shall not say "if we had only done this we should have been able to do it," or "if we had not done this." If for some time to come we have alternative systems working in different areas we should have a comparison and some standard to go upon.

18,820. In your view it would not be so safe to embark on anything so ridiculous as nationalisation of mines without having something to afford a comparison?—I would prefer to see it tried in one area.

18,821. *Chairman*: Do you understand the question Mr. Evan Williams is putting to you. Do you mean you would try a system of nationalisation on some part of the country?—Yes. If nationalisation is going to be tried as applied to the getting of coal it would be a great pity to try and swop over wholesale.

18,822. Have you in mind any particular part of the country which should be selected?—I am afraid I do not know about that.

18,823. If it were unsuccessful how would you go back again?—I agree it would be difficult; but easier than if you swopped over the whole country, and there would be more argument for it. It seems to me you might go back by leasing it, clearly.

18,824. *Sir Adam Nimmo*: In connection with the electrical development you foreshadowed, have you in contemplation a sudden revolution; that is to say, a complete change over applicable to the whole country and carried out rapidly?—Yes, I have.

18,825. Do you think that is practicable?—I think it will not be done absolutely suddenly, of course it cannot be. The factories could not turn out the electric plant required. You are limited sufficiently by the physical possibilities.

18,826. I am not going to touch on the technical side. That is really not my business. Taking it from the side of by-products, for example, where are you going to get the market for by-products which are produced as the result of your sudden development of the industry in this way, or of industry generally in this way?—I have not suggested there shall be a wholesale transfer on the by-product side, because I have said there is not a process in existence to-day which will fill the Bill. There, again, we are limited by development.

18,827. What you have in contemplation, I take it, as far as the mining industry is concerned, even regarding your element as feasible, is a slow and steady turnover from the existing practice to the new practice which you think would utilise the coals better?—Yes, that is in effect what will take place.

18,828. I am thinking more of the question of by-products. Was it not the case before the war that we were producing all the by-products which could be absorbed for the time being?—I think it is very likely you were. One is not limited to those by-products. The process I have sketched in very rough details in my evidence is a process, for instance, with regard to spirit that could be used for motor traction, which is one of the products. There is almost an unlimited field for the sale of that.

18,829. For such products as were used before the war we had a limited market?—I think so.

18,830. Was it not due to that that there was the want of expansion which has been the subject of criticism of the industry on that side?—Partly so.

18,831. Is it not the case, so far as we have gone, unless we could produce a good coke from the coal we could not from an economical point of view deal with by-products at all?—That is true.

18,832. It may be in the future we may discover new processes when the question of coke will not be an essential question; but, up to the present, the question of producing a good coke has been a very essential part of the problem?—That is so.

18,833. And that has really been the limiting factor so far in dealing with the production of by-products and the limits for by-products?—I agree. Of course, I am speaking not only from the coal point of view, but from the national point of view as a whole. I say if there had been a comprehensive electric system all over the country there would have

been this demand for these different kinds of by-product processes and it would then have been developed. I am not in any way blaming the coal industry for not having developed it. I say it is one of the things that will have to be developed in the future.

18,834. I notice on page 2 of your *précis* you say we have hitherto looked upon the coal industry to mean merely that of getting coal out of the ground and transporting it to a place where it has to be burnt. I take it you do not mean to imply by these words the cost of production of coal is an immaterial question?—No, I certainly do not.

18,835. It is not implied in your words?—I simply say our view has been rather limited to those two things, whereas there are others.

18,836. I suppose the cost of production of coal, notwithstanding all the developments you contemplate, will be a very material fact in the situation?—Very.

18,837. Would you agree we should have that cost as low as we can, consistently with maintaining fair conditions in the industry?—Certainly.

18,838. I notice on page 3 you refer to the decision of the Coal Conservation Committee that our stocks of coal, especially valuable coking coals, should be conserved. Do you mean by that that they should be kept in the country altogether?—You mean as distinct from putting a duty upon them?

18,839. Do you say we ought not to export them at all?—I am inclined to say yes, unless we could clearly get back something like iron-ore, which we are deficient in.

18,840. If we are supplying our manufacturing industries to-day with all the coke they require and we have surplus of this coking coal, why should not we ship it for the benefit of the nation?—If it can be proved we have a sufficient surplus until something else is discovered to take the place of coal, yes.

18,841. Are we not constantly making new discoveries?—Yes, I think it is a little premature to say that by a certain date we are going to do without coal.

18,842. What would be the use of keeping coal that could be profitably worked just now, if it were not to be utilised for 50, 100, or 150 years? Would it be of any value to the nation?—I agree you might have circumstances where it would be wasteful to leave it in the ground.

18,843. Why I ask you this question is this. Another very important Committee which dealt with this matter took quite an opposite view, and regarded it as quite a mistake that this class of coal should be conserved. That was the Committee on Commercial and Industrial Policy?—I do not think I should quite agree with that Committee, though I would not suggest my opinion should be taken as final upon it.

18,844. What you seem to have specially in view is that we should certainly take out of the coal all we can get out of it before we export the residuum at all?—That is really my point.

18,845. And you would not really object to the export of coke in these circumstances?—No.

18,846. I notice you speak later on from the point of view of the future conduct of the coal industry, and you make a suggestion it should be developed scientifically in order to utilise the coal reserves to the best advantage. Your remarks, I take it, apply to industry generally?—Yes.

18,847. So there would require to be a stirring up of all industries to bring them into line with the policy you define?—I think so. I think that stirring up is taking place now.

18,848. It is bound to take a long time before you can expect to change over the industry in that way?—I do not know that it is going to take so very long.

18,849. It depends upon the impulse behind?—I think the war has done a great deal.

18,850. I notice that in the last paragraph of the first column on page 3 you say, in referring to the work of the Fuel Research Board, "I think that experiment and research should be encouraged throughout the country." Do you mean on the part of private individuals?—Yes.

15 May, 1919.]

MR. CHARLES H. MERZ.

[Continued.]

18,851. That that work should be carried on at every colliery?—No, that would be going too far.

18,852. I was wondering what you had in your mind?—I think if a particular coalfield was going to be continued by private enterprise, it certainly would be wise for a combination or group of the representatives of the industry of the owners to undertake such experimental research. I think we now see that it is the duty of every industry to do that.

18,853. A great many of the larger collieries just now have a scientific department of its own, have they not?—I know they have.

18,854. They have skilled chemists who are working all the time in an attempt to develop the industry scientifically on the side of the utilisation of coal and the utilisation of gas?—I did not know that the colliery companies themselves had concentrated on the utilisation of coal so much.

18,855. Not so much on the utilisation of coal as the whole treatment of gases from coal?—Yes. I did not know that.

18,856. A very large by-product plant must be necessary of that type it seems to me?—I am bound to say my experience of the average by-product plants in the country is that they are run to the best of

their ability, but they do not go in very much for development.

18,857. Would it not be well to develop this research at the individual collieries?—Yes, certainly.

18,858. It would make for the good of the whole country in the long run?—Certainly.

18,859. I think you have had a good deal of experience in working in connection with Government Departments?—Yes.

18,860. You make a general statement that no one who has had experience of attempts to deal with anything by Government control can believe the centralisation of all such developments in Whitehall would be effective. Would you mind giving us your experience in this connection?—I think that the Government machine as represented by Government Departments in Whitehall—of course, each Department is very large and suffers therefore from the defects of all very large organisations, and it is difficult to get a move on. Development is something which has to be settled from day to day, both as regards personnel and expenditure, and if you cannot settle it from day to day, well, it is too slow. Nobody will take any interest in it.

18,861. The work gets snowed up?—Yes.

18,862. And the machine gets slowed down?—Yes

(Adjourned to to-morrow morning at 10.30.)

SECOND STAGE—FOURTEENTH DAY.

FRIDAY, 16TH MAY, 1919.

PRESENT:

THE HON. MR. JUSTICE SANKEY (*in the Chair*).

MR. ARTHUR BALFOUR.

MR. R. W. COOPER.

SIR ARTHUR DUCKHAM.

MR. FRANK HODGES.

SIR LEO CHIOZZA MONEY.

SIR ADAM NIMMO.

MR. ROBERT SMILLIE.

SIR ALLAN M. SMITH.

MR. HERBERT SMITH.

MR. R. H. TAWNEY.

MR. SIDNEY WEBB.

MR. EVAN WILLIAMS.

SIR RICHARD A. S. REDMAYNE (*Assessor*).

MR. ARNOLD D. McNAIR (*Secretary*).

MR. GILBERT STONE (*Assistant Secretary*).

Sir Adam Nimmo: Sir, before you proceed with the further examination of the witness, I understand that the final Report of the Land Acquisition Committee is now available. Would it be possible to circulate that among the members of the Commission to-day, so that they might have an opportunity of perusing it during the week-end?

Chairman: I can give you a copy for your purposes, but anyone else who wants it must try and get it.

There are many things to peruse for the week-end.

Sir L. Chiozza Money: I am sorry to add to the amount of literature, but it seems to me that Hansard's Report of that important discussion on the Electricity Bill would be very useful.

Chairman: Yes, we will try to get that.

Sir Adam Nimmo: There is one further point, sir. I asked for a return of the coal raised weekly for this year.

MR. CHARLES H. MERZ, Recalled.

18,863. *Sir Arthur Duckham*: With regard to this proof, I do not want to go into it at any great length, although it is of very great interest to me. There are one or two questions which arise on the first page of your proof in the first column. You give us figures for the fuel used at collieries. You give the figures for Durham as 3 per cent.; Yorkshire, 5·7; Lancashire, 8·3; Scotland, 9·1; South Wales, 5·6?—Yes.

18,864. Does that percentage of fuel include any allowance for the electricity made by the collieries in Durham, or is it only the fuel used in the working?—No; I think those percentages do include the electricity.

18,865. It is not the electricity bought?—No, but the same table gives a reference to the electricity bought. I mention that also in my proof.

16 May, 1919.]

MR. CHARLES H. MERZ.

[Continued.]

18,866. Really what I wanted to get at was this. Does this alteration or this variation in figures mean that the places where the figures are high are not run so economically, or is it a case of the varying character of the collieries?—Of course, you cannot assume too much from such figures, I quite agree. It is only a very general inference you can draw, and one would require to know fully the output of the collieries, and so on. As a general inference, without reference to the particular figures, I think it does prove my point.

18,867. You would not say definitely that the collieries in Scotland were run much more inefficiently than the collieries in Durham?—No.

18,868. You would not use the figures to show that?—No, that was not the idea at all.

18,869. We have had reference made to the central generating stations and these 50,000 horse-power or kilowatt sets?—50,000 horse-power, I think it is.

18,870. I was thinking of the generating set—the turbine and the generating set. Are they made to-day in England, and have we got to that power yet?—Well, not quite, but very nearly.

18,871. About 35,000?—Yes, 35,000 to 40,000 H.P. are being built now.

18,872. I presume there are not many works to-day in England that could make these big plants?—Yes, I think there are. I think there are one or two who could, but, of course, owing to there being no large scheme of this kind in existence, there has not been the demand for it. I do not doubt at all the ability of manufacturers to make them. That is what I wanted to make clear in reply to your question.

18,873. Of course it is a question of efficiency from every point of view as to how much bigger you would go. You would not go bigger simply for the sake of going bigger?—No.

18,874. In quoting from the Report of the Electric Power Sub-Committee of the Coal Conservation Committee (page 9, paragraph 1) you speak of “the saving in coal throughout the country would, in the near future, amount to 55,000,000 tons per annum.” First of all, what do you mean by in the “near future”? How many years do you estimate it will take to put in these large generating stations in the first case to get cheap power?—Of course, it depends a great deal upon the speed with which you may call the legislative machinery of the new Electricity Bill works, but I think that there will not be any number of stations doing effective work throughout the country under five years.

18,875. I was speaking more of the physical disabilities—the actual making of the plant and getting it there—than the legal or Parliamentary difficulties?—From first to last—from beginning to choose the site to running the station—you had better take three years, I think.

18,876. You might have two or three plants running in five years?—Yes.

18,877. And if they are going to be 16, it may extend into 10 or 15 years before you can get them all running?—Yes. That is not on account of the difficulty of making the plants, but on account of delay in what you may call Parliamentary procedure.

18,878. With regard to the 55,000,000 tons mentioned there, is that the estimated total coal used for power?—It is the saving on the coal used for power.

18,879. Does that touch domestic coal at all?—No.

18,880. Can you tell me very briefly what the general duties of the Electrical Commissioners are for the conservation of fuel?—The general duties of the Electricity Commissioners are to encourage and develop the use of electricity, and to do everything they can from the Parliamentary point of view to encourage it. But their primary duty is to map out the country after local enquiry into suitable areas based, not upon existing parochial and County Council boundaries, but on the best areas from a technical point of view to amalgamate for electrical purposes. That is their first and chief duty. After they have mapped out the areas, their duty in each area is to arrive, after holding local enquiries, at the best organisation for erecting and managing the electricity undertaking in that area. They have to decide

whether that is to be an elected body; how far it is to be elected by consumers; how far by municipalities; how far by manufacturers; and then as to the size of the managing board, and so on, whether they are to be paid, and all that kind of thing.

18,881. What I wanted to get at is this: Have these Electrical Commissioners any power to enquire into waste of fuel in the country?—No; I do not think you can say they have any power to do that. They have powers to enquire into the waste of coal in electric generating stations, certainly.

18,882. Do you not think it is essential that some body should be set up with power to enquire into the wastage of fuel in the country? If I may put it to you, take electrical generating plant: Of course that ought to be fairly efficient so far as efficiency goes in this country to-day. But take other works which are using coal for other purposes—for heating, for chemical works, boiler works, and all that sort of thing. There is a colossal waste of fuel at the present time in the country, is there not?—There is no doubt about it.

18,883. Do you think it would be a very great saving to the country if, I do not say the Electrical Commissioners, but some kindred body, was set up to enquire into the use of fuel in this country, and had powers of enquiring and tabulating and showing up the waste?—Yes, I think it would be very useful. I should think you would have to guard against undue duplication of returns, as it were, and I think it would have to be very carefully considered as to how far they should have power to insist upon things.

18,884. To insist upon returns?—Yes, to insist upon returns.

18,885. And you would get over duplication of returns by bringing together people who would be asking for returns like the Electrical Commissioners?—I think something of the kind should be done.

18,886. The idea has been in my mind: Would it not be satisfactory to have power, heat and light commissioners or some representatives of the Government who would take care of or enquire into the wastage that occurs at the present time in this country?—I think so, but I would be in favour of limiting it to enquiry and suggestion. I would not give them any compulsory power at present. I perhaps may explain why. I do not think that what the Americans call the “lay-out” of the heating and domestic power and so on of a big city is yet quite settled. Really we want a few more experiments before we can finally say how it is to be done. There are all these questions of low-pressure water and steam heating and all that kind of thing, and it cannot be said to be finally proved by experience what is the best system.

18,887. But you agree there is a colossal waste of fuel at the present time in this country?—I agree.

18,888. Sir Adam Nimmo yesterday asked you a question with regard to by-product ovens. I put it to you that there could have been a use made of all the by-products manufactured if they had extended their coke ovens before the war. It was more a question of not knowing how to use the by-products, was it not?—Yes, I think that was so.

18,889. Take the case of benzol for petrol engines or for light engines, or take the case of creosote oil for fuel in the Navy?—Yes.

18,890. I believe during the war those have both been used largely from home production?—Yes.

18,891. I believe I am right in saying that the Navy objected to it in the first case, but found later they could use it?—Yes.

18,892. So that there is a very big future for these by-products in that way, because you can use them instead of many of the imported by-products that we have to use at the present time?—Yes, I think that is so.

18,893. And you are not frightened that the country would be flooded with these by-products from such plants as you have foreshadowed in your *précis*?—No, I am not frightened, because I think we have learned nationally so much more about them now.

18,894. The war has taught us a very great deal?—Yes.

18,895. Another point is with regard to finance. Has any estimate been made of the financial cost of these schemes, because what I put to you is this: If you are going to purchase your generating stations

16 May, 1919.]

MR. CHARLES H. MERZ.

[Continued.]

from the present owners and then add to them the cost of the central generating stations, it will certainly cost considerably more than double what they would have cost before the war, or (let us say) double: Will the financial burden on these central electrical generating stations bears so heavily as materially to affect the price?—You mean will the increased cost of manufacture of the plants prevent the advantages being secured?

18,896. Yes?—No, I do not think so at all. In fact it is rather the reverse. The increase in the price of coal and labour on balance is greatly in favour of the use of electricity and not the reverse.

18,897. From that point of view?—Yes.

18,898. You see what I mean. You may take it the capital cost of the plant would be certainly two and a half times what it would have been before the war because they have all the existing plants and have the burden of the increased cost of erection at the present time?—Yes, but of course, the primary thing to remember about this scheme is that it is not a scheme for replacing existing things.

18,899. But you have to buy existing ones?—Yes; but that is a comparatively small thing.

18,900. There is one question I asked another witness who could not give me the information. Have you any figures as to the efficiency of electrifying main line traffic? Suburban traffic one can understand, but is there efficiency in fuel in electrifying main line traffic for long distance lines?—Yes, there is considerably.

18,901. Could you give particulars, because we did not have them before?—Yes; but of course it would mean rather extending my evidence to go into that.

18,902. Yes. If you say that it is considerable, that is all I want to get from you?—Yes; there is no question about that.

18,903. We are sitting here, as you know, to consider questions of nationalisation or unification of coal mines, and making a report on the subject. One of the chief differences which has occurred to me has been the question of safe-guarding the consumer. You have been a large consumer of coal. Do you consider it is essential that consumers should have a free choice of coals and should not be restricted in their choice of coals? Is it your opinion that any system which followed on the present lines of control, where the consumer is forced to have a class of coal whether he wants it or not, would be very bad for industry?—Well, I do not know that I would like to go so far as to say that every consumer should have an entirely free choice.

18,904. May I put it, if you have a plant suitable for certain classes of coal, surely you should have the right to buy the coal that suits the plant?—Yes. But of course one is bound to qualify that by saying that there are a great many people who think they have plants that will not use another class of coal, or who object to making a very little change, or who do not understand the changes which would have to be made and which would mean a great economy at very small cost.

18,905. Take the present time. There has been colossal inefficiency caused by the distribution of varying coals, has there not?—Yes, but I think you want to remember that the old system was hopeless of course, really, and the majority of the country had hopelessly inefficient plants. They took coal from anywhere because their grandfathers took it, or something of the kind, or the man who sold it was a friend.

18,906. Yes. Now if you wanted to change that you have to go through a period of great disorganisation and muddle, if you make any change on that scale. If you take the difference between a Derbyshire and Durham coal it is almost as great as the difference between brass and aluminium, is it not?—Yes.

18,907. That is to put a simile?—Yes.

18,908. I was asking whether you feel some safe-guard ought to be made to the consumer who has used one constant class of coal?—Yes, I agree: if a man has the proper plant for the particular locality he is in, *qua* distance from the collieries, he ought to be entitled to get that coal with regularity.

18,909. And a safeguard would have to be introduced for that purpose?—Yes, I would not like to say it is desirable to go back to the old system of absolute freedom.

18,910. With regard to the conservation of our fuel, it is, of course, essential that we should distribute the value of the fuel in the best way. With regard to power and light I think that a very strong case has been made out, but there is one point which has been left, or one point which has not been considered fully, and that is the distribution of heat units in this country. What is the loss in heat units between the coal supplied to the electric stations and the value of the heat units on a switchboard of the consumer?—Do you mean under the best practice to-day, assuming a scheme like this?

18,911. Yes, let us take the best scheme.—Delivered to the consumer you would only get about 20 per cent. out of the heat of the coal. Of course, that figure is always gradually improving.

18,912. But theoretically there is not much chance of much greater improvement, is there?—Well, I would not like to say that.

18,913. Have you ever thought of coming to 30 per cent.?—Yes, I have a plant running at 30 per cent. to-day.

18,914. From the fuel in boiler to consumer?—From fuel to electricity.

18,915. That is an extraordinary result, is it not?—It is; but I do not say that that is applicable to all conditions.

18,916. The point I want to get at is this: If you had got an initial loss of, say, 80 per cent., taking these figures under the schemes which you put forward here, it seems wrong to distribute your heat units with an initial loss of 80 per cent. Would it not be better in your central generating stations to have some method of distribution in which you could distribute the heat units with a less loss? For instance, if you are making gas at your central generating station, would it be better to distribute the gas than get the loss on it by turning it into electricity?—That is a very large question and cannot be answered merely on these percentages. People talk a great deal about electricity *versus* gas and that sort of thing.

18,917. I am not discussing that, of course.—No, but what you have to bear in mind about electricity is this: electricity is the best means we know of making energy readily available for use.

18,918. By energy do you include heat?—Yes, heat for certain purposes.

18,919. For specific purposes?—Yes. It is the absolute control that you have over electricity that goes for efficiency. Therefore, although under certain circumstances the loss in conversion of the heat energy in a fuel into electricity may be material—30 per cent. or 40 per cent. more than if you tried to use the heat some other way—yet you may use actually less coal to produce the result. The commonest instance which we would all readily grasp is the heating of a bedroom. Probably to heat a bedroom in London you actually burn less coal to heat it electrically than to heat it any other way simply because of what is technically called the load-factor of the bedroom. On the other hand, if you want to heat a study it is quite clear it is a very inefficient way of doing it. Therefore I do not think you can argue it entirely from percentages.

18,920. No, but you see the point I was putting?—Yes.

18,921. And there is 80 per cent. lost in conversion into electricity of actual heat units?—Yes. Of course, the most efficient heating system of all is probably to generate electricity and use your exhaust steam for heating your houses. That is probably the most efficient of all.

18,922. You have small units then?—No, not necessarily.

18,923. I think you and I would like to discuss it, but we will not pursue it now?—Very well.

18,924. *Sir I. Chiozza Money*: I am very much obliged to you for your evidence and I have very little to ask you. I was very much interested in what you say on page 3 of your *précis* in the penultimate

16 May, 1919.]

MR. CHARLES H. MERZ.

[Continued.]

paragraph. You use the words: "there should be a definite policy in connection with the winning and utilisation of coal"—you told us something about utilisation?—Yes.

18,925. What was in your mind when you spoke about a definite policy in connection with the utilisation?—Well, I meant such questions, for instance, as to how far now collieries ought to be developed at the present time, which fields should be developed, what seams should be worked first and so on. Clearly, I would not attempt to state such a policy, because I do not profess to be a coal mining engineer; but it seems to me obvious that there are a great many questions which we cannot afford to leave entirely to the whim of the individual to settle.

18,926. Your policy would go so far, I suppose, as to endeavour to direct the kind of technical method to be used?—Yes, or, at any rate, to see that the different alternatives were well ventilated and that people did not go on in ignorance doing the wrong thing.

18,927. Do you think that could be done without some form of central administration analogous to what has been done in the case of electricity?—No, I think there are very few people who could object to the form of central control that has been advocated in the case of electricity. It leaves the maximum freedom to the individual district.

18,928. You have said you do not pretend to technical knowledge in the case of coal, but, still, there is nothing very recondite about coal-getting. Have you formed any opinion as to the application of some such system as this electrical system and Electrical Commissioners to districts administering the technical side of the operation in considerable areas? Have you thought of the application of that to coal, and whether you think that would carry out your idea?—Yes; I think I have said in my proof that that is the kind of organisation which is well worthy of consideration.

18,929. In connection with coal?—Yes.

18,930. In the last column on page 3, you say something about Government Departments and businesses which require rapid developments. Do you think that any Government Department could have applied science to industry more slowly than it has been applied in this country by private enterprise in the last 25 years? Could it be much slower than it has been?—Yes. Of course, you must compare like with like, so far as you can. You must not compare what a Government Department would be now with private enterprise before the war or what private enterprise would be now after the war with a municipality before the war, but, speaking generally, before the war the concerns which I am acquainted with which were run by other than private enterprise did not do as much for the technical development of their particular industry as those which were run by private enterprise. I am only speaking of things I know about.

18,931. If you take actual experience (having regard to what you have very well said) of the war, has there not been a very remarkable amount of experimental work carried on under Government auspices and by direct Government stimulation?—Yes.

18,932. Has there not been employment of gifted men as they were never employed by private enterprise?—Yes, I think there has been.

18,933. Are there not quite a dozen Departments in the Ministry of Munitions which had to begin almost *de novo* in industry?—Yes, I do not think anyone would wish to question that.

18,934. Do you not think therefore that in considering Government enterprise now, you really must have regard to these new developments?—You mean to say, to the new spirit.

18,935. Yes.—Yes; I think that there has been a change. One cannot deny that.

18,936. To take these 5 Electrical Commissioners, do you think that the State will have any difficulty in getting 5 first-class electrical experts to administer the electrical policy of this country?—No; I think that they will get them, because I think that they have been placed in a position of considerable freedom.

18,937. If therefore some such system or policy were extended to the administration of coal?—?—Do you mean the control of the industry?

18,938. Yes.—have you any reason to think that the Government would fail to get its experts?—No. I understand you are not asking me about complete nationalisation, but you are referring more to the machinery of administration.

18,939. Yes.—Yes, I quite agree.

18,940. *Mr. Robert Smillie*: Sir Adam Nimmo put to you that prior to the war we were producing all the by-products which could be absorbed for the time being, and I think to some extent you acquiesced in that?—No, I do not think I entirely acquiesced. I think I said I understood that there were variations of price, or what I understood is that there were variations of price of by-products and so on which formed some excuse for some of the delay.

18,941. Have you any idea of the number of German firms that were coking coal at British mines and sending the by-products to Germany?—No, I have no idea, but I know there were German firms interested in British coke ovens.

18,942. Would you be surprised to know that in Yorkshire there were at least 8 cases in which the Germans were coking coal at the pit in their own ovens and sending the by-products to Germany?

Sir Arthur Duckham: Is that German-owned ovens?

Mr. Robert Smillie: Yes, German-owned and German erected, and the by-products taken out and sent to Germany.

Sir Adam Nimmo: Could we have a list of these collieries?

Chairman: Yes.

Witness: I cannot give you specific data. I cannot give evidence about specific instances. I only know from a sort of general hearsay and discussion with people that there were companies which were German controlled making that kind of arrangement.

18,943. *Mr. Robert Smillie*: Have you heard it said that during the war our soldiers were being killed by explosives manufactured from the by-products of the mines of this country which were sent to Germany?—I have not heard it said.

18,944. You would not be surprised if it were the fact, would you?—If the by-products went to Germany immediately before the war, I suppose it would be true.

18,945. Would you be surprised to hear that the Germans imported coal, and some of the best coal produced in this country, and took it to Germany and coked it there and sent back the by-products of it to this country?—I should not be surprised at all.

18,946. If that were so, surely it did not prove that our mine owners here were treating the by-products of the mines as efficiently as they might have done. It did not show the highest efficiency that Germany took some of our coal and sent back the by-products here?—I do not think there is any doubt that one must say that the development of the by-product business in this country has not been much to our credit, but then there were a great many other things of a similar nature of course which were not much to our credit before the war.

18,947. I quite agree.—We certainly did not do it ourselves, but there were a great many other things in the same position.

18,948. Do you know a number of British mine owners secured their generating plants for their own collieries in Germany on the ground that they could not be supplied with them here?—Well, as a matter of fact, if they did it was not correct to say that they could not be supplied here.

18,949. I put it to some of the mine owners who were importing German generators why they went to Germany to get their generators for their collieries, and they said they could not get anything suitable in this country. I wonder how far that would be correct?—I think you may take it the answer to that was that the Germans managed to secure a good English salesman to act for them. It was not correct of course.

18,950. I can give you the name of a general manager in Scotland who is considered to be in the

16 May, 1919.]

MR. WILLIAM WALKER.

[Continued.]

front rank as a mining engineer, and that is the rofly he gave me?—Well, it was not correct.

18,951. You think he was mistaken?—Certainly he was mistaken.

18,952. Do you think we have made the fullest use we could of electricity in mining in this country?—No, I do not think we have.

18,953. Have you any idea of the number of electrical winding plants that you have?—No, but it is very small.

18,954. It is comparatively small?—Yes. A very small thing. But of course it is fair to say in that respect that electrical winding is not a commercial proposition unless supplied from a large electric system.

(The Witness withdrew.)

MR. WILLIAM WALKER, Sworn and Examined.

18,957. *Chairman*: You say in your proof: "I am, and have been for more than thirty years, an inspector of mines, viz.:—(1) from April, 1889, to November, 1904, as an assistant inspector of mines in the Durham inspection district, comprising South Durham, Westmorland, and North Riding, Yorkshire; (2) from November, 1904, to May, 1909, as inspector in charge of the Yorkshire inspection district, which comprised East and West Ridings of Yorkshire and Lincolnshire; (3) from May, 1909, to June, 1910, as inspector in charge of the Midland inspection district, Derby, Nottingham, Leicester, Warwick, Northampton, Rutland, Huntingdon, Cambridge, Oxford, Berkshire, Buckingham, Bedford, Hertford and Middlesex; (4) from June, 1910, to May, 1914, as inspector in charge of the Scotland division, comprising the whole of Scotland; (5) from May, 1914, to March, 1917, Deputy Chief Inspector at Home Office; and (6) from March, 1917—owing to Sir Richard Redmayne's services being lent to the Controller of Coal Mines—as Acting Chief Inspector of Mines"?—Yes.

18,958. *Chairman*: Sir Allan Smith, I am glad to say, asked a question yesterday with regard to Sir Malcolm Delevingne's evidence, who was the Home Office witness. At question 18,039, Sir Allan Smith asked Sir Malcolm this question: "This opinion is your own and not in any way the official opinion of the Home Office"?—These opinions are put forward "as the official opinions of the Home Office." I was very glad that Sir Allan Smith raised the point yesterday as to that answer, and I asked Sir Malcolm Delevingne to come here and to see me on the point, as I promised. He was good enough to come yesterday afternoon and to give me this note, which I will read. "When I said that the views I expressed were Home Office views and not merely my personal views, I meant that they were views which were based on the experience of the Department in the administration of the Coal Mines Act, and had been formed by me in consultation with my colleagues in the Departments; it was that evidence which I understand the Commission desired to have. I did not intend to convey that the views expressed were the views of the Home Secretary himself; they were not submitted to him beforehand, and he is, of course, in no way bound by them. Perhaps it would be clearer to call them departmental views. Without pledging them to every word, I understand I was expressing the views of the Chief Inspector of Mines and others associated with me in the administration of the Act." Is it upon that basis that your evidence is given?—Yes.

Chairman: I am very much obliged, and I will now ask the Assistant Secretary to read your *présis*.

"*Inspection of Mines.*"

In the year 1908 the post of Chief Inspector of Mines was created and an Electrical Inspector of Mines was appointed, and in 1910 the inspection districts were re-organised and the additions made to the staff, both as regards numbers and classes of inspectors.

The districts were in that year reduced from 12 to 6, and Divisional Inspectors were appointed to take charge of the new divisions, with Senior Inspectors acting practically in each of the old districts.

18,955. I was going to put that to you. It would not be perhaps commercially wise for each colliery to generate their own electricity and electrify their winding gear?—No, there would be very few cases where that would be commercially sound.

18,956. But if opportunity were given of securing in a handy way a reasonably cheap supply of electricity from a central station it might be wise to electrify a number of collieries?—I think the tables are exactly turned then. In that case there are very few cases where it would not pay to wind electrically.

Chairman: Mr. Merz, we are very much obliged to you for the assistance you have given this Commission.

A new class of inspectors, known as Sub-Inspectors both of Mines and Quarries, was appointed in 1912, and in 1913 Inspectors of Horses in Mines were appointed.

In the year 1907 the staff consisted of 39 inspectors, viz.:—1 Superintending Inspector, 12 District Inspectors, and 26 Assistant Inspectors. In 1914 there were 89 inspectors, viz.:—1 Chief Inspector, 1 Deputy Chief Inspector, 1 Electrical Inspector, 6 Divisional Inspectors, 14 Senior Inspectors, 31 Junior Inspectors, 21 Sub-Inspectors of Mines, 8 Sub-Inspectors of Quarries, and 6 Horse Inspectors.

The Coal Mines Act of 1911 and the Regulations thereunder provided a new safety code for mines, but this code did not come fully into operation till the middle of 1913, and, owing to the abnormal conditions arising out of the war, its effects cannot yet be estimated. The Act left some of the most difficult problems to be worked out by investigation on scientific lines, and this was suspended by the war. These inquiries are now complete, or almost complete, and measures will be proposed almost at once to deal with coal-dust explosions, spontaneous combustion in mines, and other matters.

The death rate in coal mines in the United Kingdom does not, as will be seen in the tabular statement attached hereto,* compare unfavourably with similar mines in the Colonies and foreign countries. In Belgium, where the death rate per 1,000 persons employed is less than that for the coal mines in the United Kingdom, the number of persons employed and output are comparatively speaking small, and there are areas in the United Kingdom where the persons employed and output are about the same, and the death rate per 1,000 persons employed and 1,000,000 tons raised is lower (*see statement attached*).

The conditions under which the mines are being worked in the United Kingdom are more dangerous than they have hitherto been owing to increased depth and the seams producing greater quantities of firedamp and coal dust and in some areas, where these conditions exist, to their liability to spontaneous combustion.

The inspectors are not responsible for the management of any mine: their powers are wide, so far as inspection and investigation are concerned, and are laid down in Section 98 (1) of the Coal Mines Act, but they do not include management. It is not desirable, in my opinion, that they should; the best results from the point of view of safety I think are obtained by making, as at present, the management responsible. The suggestions which have been made in evidence before this Commission that there should be a Committee of Management at each pit, with executive power to interfere with the manager, would not result in increased safety. Such a system would interfere seriously with the discipline of the mine, which, if accidents are to be prevented, must be maintained. The present Coal Mines Act in Section 2 (4) provides that the owner or agent of a mine required to be under the control of a manager shall not take any part in the technical management of the mine, unless he is qualified to be a manager, and this is necessary both for maintenance of discipline, on which the safe working of mines so much depends, and to prevent interference with a manager

* See Appendix 65.

16 May, 1919.]

MR. WILLIAM WALKER.

[Continued.]

by any one who does not possess the necessary technical qualifications. If any scheme of nationalisation is eventually decided upon it is important that this provision should be observed. Dual control in any form in connection with the technical management of the mine would, in my opinion, lead to chaos and possibly disaster. In the management of a mine immediate decisions have to be made and directions given and acted on in numerous circumstances which arise suddenly and with little, if any, warning, such as when outbursts of gas occur, when the gob stink indicative of incipient spontaneous combustion is detected, reversal of the air current in connection with explosions and fires underground, falls of roof and side blocking airways, and in many other ways. The manager would have to act at once in such circumstances, and it would be impossible for him to consult any Executive Committee. The manager is responsible under the Act for his own actions and those of others, and it is, in my opinion, essential in the interests of safety that this control and responsibility should not in any way be lessened or interfered with.

I am in favour of "Safety Committees" of representatives of the officials and workmen being appointed at every mine to inquire into all accidents and other matters relating to health and safety with a view to reducing the number of preventable accidents and improving the health and safety conditions, and I have already brought this proposal to the attention of the Mining Association of Great Britain and the Miners' Federation. Such a committee should, so far as accidents are concerned, be given the same information as a manager is required to send to the Inspector of Mines, and the Committee, after considering it, could, if it thought fit, examine the scene of the accident and suggest what measures should be taken to prevent a recurrence of accidents from the same or similar cause. The Committee should also make inspections at the mine in order to see whether all the protective measures in method of working and other ways are being taken for the purpose of impressing on the officials and workers the need of constant care and showing what should be done to prevent similar accidents in future. They should make reports of these investigations and recommendations to the manager, whose duty it would be to consider and, if he approved, adopt the recommendations. (See pages 75-77 of Part II. of General Report by Chief Inspector of Mines for 1917.)

Baths and Facilities for Drying Clothes at Pit Head.

The facilities for taking baths and for drying of clothes have not been provided on the conditions, viz., partly paid for by the owners and partly by the persons employed, and managed by a Committee of the Management and Workmen; but at seven collieries facilities have been provided by the owners, and I attach a statement giving the names of these collieries, the total number of persons employed at the mine, and the number of persons using the baths.

I was Chairman of a Committee, consisting of Sir Francis Brain, Mr. Smillie, and myself, appointed in 1912 by the Secretary of State to consider the provision of washing and drying accommodation at mines under Section 77, and I would refer the Commission to the Committee's Report, which was made after visiting mines in France, Belgium, and Germany.

The provision and compulsory use of baths and facilities for drying pit clothes at the pit head on the lines laid down in that report at all mines except small mines, as defined by the Act, is, I think, an urgent necessity, and would prove to be a great boon to mine workers and improve greatly the conditions at their homes. The dirt inseparably connected with the miners' occupations should be left at the mine, and not taken into their homes. The health of the miners and their families and the social condition under which they live would thereby be greatly improved, and the condition of the trains, trams, and other means of transport be much better from the point of view of the general public. At metalliferous mines, where the work is cleaner than coal mining, it is required that washing facilities shall be provided for the persons employed at all mines at which more than

12 persons are employed. This provision is approved and used by the workers. I attach a statement giving a list of the mines at which such baths and facilities have been provided."

18,959. *Chairman:* Gentlemen, there are some tables at the end which I had better draw your attention and public attention to. The first table gives the number of persons employed under and above ground at coal mines in the United Kingdom and the principal British colonies and foreign countries for the years 1903-1912 inclusive, and it may be interesting just to look at one or two of those figures so as to see the nature of our own mining industry. Taking the year 1912, in Great Britain and Ireland there were 1,072,393 people employed in the coal mining industry. I think the next highest is the United States with 722,662 people employed. They are run very closely by Germany with 718,673 persons. So that you have in three cases there are one million people employed, and in Germany and the United States about 700,000. Then there is a very considerable drop, and you get to 132,000 in India, 202,000 in France, and a very considerable drop after America and Germany. Now if you would be good enough to look at the next table, table B: "Output of coal in the United Kingdom and principal British colonies and foreign countries for the years 1903 to 1912 inclusive," taking 1912 again, the output of Great Britain was 264 millions odd, the output of the United States 484 millions odd, and the output of the German Empire 255 millions odd. Those are the important ones. Then if you will look at the next table, that is a very important table: it is headed "Deaths from accidents under and above ground in coal mines in the United Kingdom and principal British colonies and foreign countries." Taking 1912 again, Great Britain and Ireland, there were 1,248 deaths; Germany 1,750, and in the United States of America 2,442. Then you get in the next table the death rate from accidents per thousand persons employed under and above ground in coal mines in the United Kingdom, etc. Taking the figures again for the big countries, they are in 1912, Great Britain and Ireland 1.17, the German Empire 2.44, and the United States 3.26. Then you get in the next table the death rate from accidents under and above ground per million tons of coal raised, Great Britain and Ireland, taking 1912, for every million tons of coal raised we unfortunately lost 4.75 deaths from accidents, the German Empire 6.84, and the United States of America 5.04. I am taking three countries in each case. Of course there are a great number of other figures. The next table is "Output of coal, number of persons employed, and death rate from accidents per 1,000 persons." I will not go through the figures for the late Midland inspection district. Anyone can comment on that who desires to do so. Then there is a very important table relating to bathing and washing facilities in operation at certain collieries in the United Kingdom. In the northern district it says there are no facilities provided. Does that mean to say that there are no baths at all?—None at all.

18,960. You say "in operation at certain collieries in the United Kingdom." Does that mean only one colliery in Scotland?—Only one in Scotland.

18,961. "Soap and towels not provided, men bring their own. Baths are used by men who live furthest away: those who live near prefer to go home. Many returned soldiers are using the baths." Then, in the northern district there are no facilities at all. In the York and North Midland district there are facilities at the Wharfedale Silkstone, Yorkshire, and the remark is: "Of the 72 persons using the baths, 12 use slipper and 68 shower baths. The men pay 2s. per quarter, which includes bath and water and attendance. Men find soap and towels. There are six slipper and 8 shower baths. They are used by all the three shifts, at 6 a.m., 2 p.m. and 10 p.m." Then we come to Lancashire and North Wales district, where there are four collieries: Gibfield, Chanters, Victoria, Readley. The note is, at the first colliery 40 shower baths, at the second 62 shower baths, at the third 19 shower baths. Then the note as to those three is, "Men provide their own soap and towels, but contribute nothing to the expenses"; then there

16 May, 1919.]

MR. WILLIAM WALKER.

[Continued.]

is the same note with regard to the fourth one, the Readley?—Might I explain there that the first three collieries all belong to one firm, and the Readley colliery belongs to another firm, so that there are really only two collieries.

18,962. What about Atherton: Is there a colliery called Atherton?—I have not heard of any baths there.

18,963. I thought there were baths there, but I may be wrong?—The first three are Fletcher & Burrows, Gibfield, Canters and Victoria Pits.

18,964. These are the Atherton baths. I know them as Atherton. Then the next is South Wales Deep Navigation: I suppose that is Treharris?—Yes.

18,965. They have there 70 shower baths. "A charge of 6d. per person per week is made for the use of the baths, which does not, as yet, reach working expenses." In the Midland and Southern district no facilities are provided. Then there is a note at the bottom: "In addition to the above, there are swimming baths at two collieries, one in Derby and one in Notts, but neither of these baths is used for washing." I am obliged to you for the table?—I have a little more information that I could give.

18,966. What other information have you?—It is information I have got since that table was prepared.

18,967. Then will you give it to us now?—It is as to the extent to which these baths are used at the various collieries. When the Committee visited Belgium and France, where the same type of bath is provided, we found that about six men per cubicle could bath in an hour, and, applying that standard to the baths that had been provided here, I find that at Wellesley Pit in Scotland there are 84 cubicles provided, and the number of men in the greatest shift is 460, while the number of men using the bath in that shift is 130. At Wharnciffe Silkstone, the number of baths is 14, the number of men in the biggest shift is 479, and of the men in that shift, 30 use the facilities, but it should be explained, of course, that the Wharnciffe Silkstone is a very small installation. Then, at Gibfield, there are 534 men in the largest shift, and of these, 260 men use them. Applying the standard of Belgium and France to that, there are 20 more men using the baths than there would be if they were in Belgium. Two hundred and forty would be the number at six per cubicle per hour. At Chanters there are 714 men in the biggest shift, 400 men are using them; applying the same standard of Belgium and France, there would only be 372, so that there are 28 more than that standard using the baths in that colliery. At Victoria there are 112 men in the biggest shift, and 101 are using the bath. At Readley there are 330 in the biggest shift, and 170 are using the bath. At South Wales Deep Navigation the number of men in the biggest shift is 1,323, and of that number 372 are using the facilities provided.

18,968. Is it right to say that when baths have been once installed they get more and more used?—I think so. I think these figures I have just given with regard to the Lancashire baths show that the facilities provided are being used to their fullest extent.

18,969. Mr. Smith has a very wise question, if I may so, and that is: At how many of these collieries are there drying facilities for clothes, for example?—At every one of them, except Wharnciffe Silkstone.

18,970. *Sir L. Chiozza Money*: Might I ask you whether you can tell us anything as to the quality of the accommodation? Apart from the question raised by Mr. Smith—the general quality, which has so much to do with it—are the facilities good?—The quality of the facilities at all the collieries is, I should say, quite good. If the Commission would like it, I could get photos showing the Deep Navigation baths inside and out.

18,971. *Chairman*: That is the Treharris ones?—Yes.

18,972. What I want to accentuate upon your evidence is that, when they are once installed, they are more and more used?—The evidence is that, with the exception of the Deep Navigation at Treharris, where they say that that has not been the

result, in all the Lancashire ones they have been used, as I have said before, even to a greater extent than one would expect them to be, considering the facilities provided.

18,973. I observe that you put a column headed "If workers have a voice in management of baths, etc.," and I observe the answer is, in all cases, on that that they have not any voice in the management?—That is so. These facilities are not provided under the Act.

18,974. *Mr. Arthur Balfour*: Do you not think, if the workers had a voice in the management, that is if they ran the baths by committees, that they would be more used than they are?—I think they should have a voice in the management.

18,975. *Mr. Evan Williams*: You do not attribute the small use that is made of the baths entirely to lack of accommodation, do you?—I think, from these figures, I could say that if more baths were provided, say, in Lancashire, they would be used to a greater extent.

18,976. But as far as South Wales is concerned, you do not suggest that?—I have just explained that, as far as Treharris is concerned, the figures do not show that they are being used to their fullest extent.

18,977. I have some later information that, even in Treharris, there is a gradual increase?—My figures were taken very recently.

18,978. During the last sitting I sent a telegram asking for particulars, and the reply I got was, "Bath accommodation 730, used by about 420 out of 1,800 men employed"?—I think I show that.

Chairman: So that the universal evidence is that once they are installed they gradually get more and more used.

18,979. *Mr. Evan Williams*: Assuming that the provision of baths was made compulsory, would you advocate the use of them by the men being also made compulsory?—I would.

18,980. Do you think that the effect on the health is so important that you would make it obligatory on the men to use them?—I would, and I think the condition of the men's homes would be so much improved. Not only that, but that the trams, trains and public conveyances in the place would be in a cleaner condition. The dirt that is made in the pit ought to be kept at the pit.

18,981. Now just a word on the comparison between the different countries. It is quite clear from the tables that, as regards safety, this country is far and away in advance of any country that is comparable with it in the extent of its mining?—I think these figures prove that, considering its size, the British coal industry is as safe as any, or safer.

18,982. In fact the only country that is materially better is Queensland, and that is a very small matter?—Yes, that is why I gave these figures as to the output and the number of accidents.

18,983. You give the number of accidents in those tables?—Yes.

18,984. Is it your view that the number of non-fatal accidents bears some relation to the number of fatal accidents at collieries?—I think so. I think at collieries, when you find the number of fatal accidents is few, you will find that the number of non-fatal accidents is also few.

18,985. So that it is fair to assume that if our fatal accident record is better than that of any other country, our non-fatal accident record is likely to be in the same direction?—I could not say definitely because I have no figures from these other countries.

18,986. The same thing that would cause fatal accidents would cause non-fatal accidents?—Yes.

18,987. So that it is a reasonable assumption to make?—I should not like to commit myself to that because I have not the figures.

18,988. But what would you say in the absence of figures?—It is an inference that may fairly be drawn.

18,989. You say in your proof that certain inquiries have been made, and are almost complete, with regard to certain things that the Act of 1911 did not deal with?—Yes.

18,990. There has been research work going on, has there not?—Yes, all the time.

18,991. By whom has that research work been conducted?—In respect of what?

16 May, 1919.]

MR. WILLIAM WALKER.

[Continued.]

18,992. In respect of all the matters that you refer to?—Coal dust?

18,993. Yes, coal dust explosions?—Coal dust explosions experiments were carried out originally at Alltoft's, and they were taken over by the Home Office and then were continued at Eskmeals.

18,994. Then with regard to spontaneous combustion?—With regard to spontaneous combustion there is a committee appointed of which Sir Richard Redmayne is Chairman, still considering that question.

18,995. I believe a good deal of work has been done by colliery owners?—Yes. So far as stone-dust is concerned, I have taken some figures out, and although no regulations have yet been established I find that stone dusting has been done in the Scotland Division in 22 mines, in the Northern Division in 70 mines, in the York and North Midland Division 139 mines, in the Lancashire and North Wales Division 70 mines, in the South Wales Division 34 mines, in the Midland and Southern Division 22 mines, a total of 357.

18,996. It is true to say that a good deal of work has been done by private colliery companies entirely on their own account?—Yes, also, of course, as a result of reminders from the inspectors.

18,997. You are aware that in South Wales there is a considerable strength of opinion that stone dusting is impracticable in certain parts?—Yes, I have heard so.

18,998. There have been experiments made and a good deal of research work by colliery companies as to other means of perfecting it?—Yes, such as water-screens.

18,999. Water-sprays and water-screens and that kind of thing?—Yes.

19,000. Generally speaking, do you find that you get hearty co-operation and every assistance from colliery owners in dealing with research work?—Yes. There are exceptions to every rule: as a rule, yes.

19,001. Generally speaking you do?—Yes, as a rule.

19,002. With regard to the safety committees that you mention, you say that they should make inspection of the mines from time to time. Do you suggest that that should be in substitution of the inspection that is now made by the workmen's examiners under the Act?—Yes, or in connection with it. I should say in addition to it.

19,003. What has been your experience with regard to the inspection made by the workmen's inspectors in the past?—I have always been in favour of them, and have received very great assistance from the inspection made on the part of the workmen.

19,004. They have been valuable?—Quite.

19,005. That was the opinion of the colliery managers generally?—It was not up to a certain time, but taking Northumberland and Durham, it has always been. I was there some 16 or 17 years, and it was the universal practice then, and it worked very well. To some extent I have always thought that their low death rate might be due, to a certain extent, to that fact.

19,006. Have you found any objection, on the part of colliery managers, to these inspectors?—Yes, some.

19,007. What district?—I would not say objection, but they have rather resented it.

19,008. Do you not think that the opinion at the present time is the other way?—At the present time I should say they do not, but up to a certain time they did.

19,009. Suggestions have been made at this Commission that the Act has not been complied with, with regard to detaching hooks at collieries. The Act provides that exemption should be given by the divisional inspector with regard to the provision of these things?—I am not sure, but I think it is with the Secretary of State.

19,010. Yes, by the Secretary of State. The period, from the time the Act came into force up to the beginning of the war, was not very long, was it?—No.

19,011. In granting exemptions from this, has the Secretary of State taken into consideration the class of headgear that the collieries had?—In some instances.

19,012. In some instances, it is true to say that it would require a complete change of the colliery's

headgear before the statute could be put into operation?—Yes.

19,013. And any such change during war time would mean the closing down of the colliery?—I do not know of any cases where a detaching hook has not been provided if they have not got exemption.

19,014. I am not suggesting that, but where the headgear does not admit of putting detaching hooks, new headgear would have to be provided?—Yes, putting in a ring.

19,015. That would mean interruption in the working of the colliery?—Yes.

19,016. During the war that has been the case where detaching hooks have not been provided?—Yes, the difficulty of getting material.

19,017. With regard to electric lamps, I see from the annual return that about 1,000 of the safety lamps of the country were in 1917 electric lamps?—I think, from memory, the figures are 140,000 and that the flame lamps are about 600,000.

19,018. There has been a great deal of difficulty in getting electric lamps, has there not?—There has been some difficulty.

19,019. The lamp that has been provided up to the present time is not a totally satisfactory lamp, is it?—Some of the lamps that are now in use give fairly good results. I do not think it is a lamp that will eventually be used in mines: it will be improved.

19,020. There is progress being made in them?—The Secretary of State has just appointed a Committee to inquire into safety lamps, and that will be one of its duties.

19,021. Up to the present, of course, a safety lamp in use must be of approved pattern?—Yes.

19,022. In approving of patterns of safety lamps, has the Home Office taken into consideration the illuminating power as well as the safety or the safety only?—Yes; the Secretary of State has made an order that a flame safety lamp must give an all-round light of not less than .3 candle power, and an electric lamp a light of 1 candle power.

19,023. The standard for the lamp is low?—Yes.

19,024. The precautions that are necessary to be taken for safety lamps have the effect of diminishing the lighting power—take the case of the double gauze, for instance?—It must be .3 with the double gauze.

19,025. That double-gauze lamp which you insist on would not give as good a light as the single-gauze lamp?—I am not sure of that. I think some double-gauze lamps would. It is all a question of air inlet.

19,026. *Sir Adam Nimmo*: I do not want to ask you very many questions, because I understand that, generally speaking, you agree with the evidence which was given by Sir Malcolm Delevingne?—I do.

19,027. On the point that was referred to by Mr. Evan Williams, when you referred to the death rate in coal mines in the United Kingdom as not comparing unfavourably with the death rate in the Colonies and in foreign countries, do you not agree that you were rather modest in the use of the words that you employed in that connection? Could you not have said "most favourably"?—They compare favourably, but, of course, you have to take into consideration in the United States the death rate per million tons raised is much better than the death rate from persons employed, but that, of course, is due to the conditions. The mines in the United States are just beginning.

19,028. Would you say that the true basis of comparison ought to be the number of persons employed?—I do not know. I think you want to take both.

19,029. But when you have more favourable results, as in the case of the Colonies, you really have very small units that you are dealing with?—That is so; one accident would upset it all.

19,030. As a matter of fact, in the case of Queensland, Victoria, and Western Australia, the number of men employed is really negligible as compared with the number of men employed in Great Britain?—That is so.

19,031. And, therefore, you can draw no real comparison between the death rate as applicable to Great Britain and the death rate applicable to such a limited number of men?—No; I think you might

16 May, 1919.]

MR. WILLIAM WALKER.

[Continued.]

have one or two accidents at mines in Queensland, for instance, which would alter the comparison altogether.

19,032. Would you not be right in assuming that in a new country where you are simply opening up mining the chances are that you start with the most favourable mining conditions?—Yes.

19,033. I think by a natural process of selection?—Yes. Of course, it depends on many conditions—geological and otherwise.

19,034. But it is quite a fair inference to say that in a new country you probably start with the most favourable conditions?—Yes, I think the conditions in the United States are probably much better than our own.

19,035. Regarding Belgium, I do not know whether I am right, but probably you know that it may be quite a wrong view that has been expressed to me—but I understand in the case of Belgium, when they deal with the cases of fatal accidents that they only record those that are immediately fatal. Do you know whether that is the case or not?—I could not say. I could find out. I should have to look it up; my memory would not serve me.

19,036. I understand that the position in Belgium is that if a case is not immediately fatal it is not regarded as a fatal accident?—Do you mean to say if a man dies three months afterwards?

19,037. Yes—or three days afterwards?—It would be regarded as non-fatal?

19,038. I do not say that, but I say it is not included in the records of fatal accidents?—I could find that out.

19,039. I have no knowledge of it personally, but it would be interesting to find it out?—Yes.

19,040. The Belgian record is shown to be comparatively favourable, and it would be of advantage to know whether that is the fact or not. Now coming to the question of inspectors, I notice that you say that their powers are wide?—Yes.

19,041. I take it that you agree that they exercise the powers that they have to the fullest extent possible?—They do.

19,042. In your view is the number of inspectors in the country at present adequate?—I do not think we have reached the limit, of course. I think they will be increased.

19,043. Has there been any difficulty in connection with the department in securing all the inspectors that were required?—Not up to now.

19,044. There is no difficulty raised at any time, is there?—We have questions raised as to whether the salaries compare favourably with the salaries of people in similar or corresponding positions.

19,045. That was hardly the point I was touching on. What I meant was no obstacle is put in the way of an increase of the inspectorate if it is found to be desirable?—No, I should say not, but we should have to get Treasury sanction.

19,046. So that that rather suggests that the number of inspectors is at present, in your view, quite adequate for the work to be done?—It would not be fair to say. The increase in the number of inspectors took place so recently, and we have had the war since that, and some of our inspectors who are Territorials or who volunteered for active service have been away, so that I could not say yet that I am satisfied that the number that we have now is sufficient, because we have not had sufficient experience. But I think that the number that is given in 1914 of 89 would be sufficient to give us information as to the condition of the mines.

19,047. However, it is a question of Home Office responsibility as to the number of inspectors that are employed?—It is.

19,048. I do not want to ask you more than one or two questions with regard to this very important matter of dual control; but I take it that your view generally is that there must be undivided and unassailable authority in the hands of the manager?—Yes, I think the manager's responsibility and control should not be lessened or interfered with in any way if discipline is going to be maintained and the pit properly managed.

19,049. If that is your view with regard to technical management, do you see any point in the conduct of a colliery undertaking where joint control would be practicable at all?—Do you mean from the point of view of safety?

19,050. I take it that your view is that in respect of the technical management of a mine, dual control is impracticable. Is dual control practicable at any other point?—Do you mean with regard to the technical side?

19,051. No, I mean with regard to the general control of the undertaking?—I do not know; I should not like to say that it was.

19,052. Can you think of any point at which dual control could be used in a practicable way?—I agree with what Sir Richard Redmayne said as to the management of the colliery generally: in that respect it might be necessary to have some control.

19,053. When you say with regard to the management of the colliery generally, do you mean with regard to such questions as the distribution of the coal?—And the general arrangement of the field, using your field to the best advantage. There are several points as to that in which I think dual control would be necessary. I do not think the coal is wound up the shaft in the most convenient way. I know cases where coal has been hauled underground for two miles where there was coal close to that could be worked.

19,054. You are not suggesting that to deal with any question of that kind we should have joint control?—You would have to have some arrangements of that kind, either by agreement among the colliery owners as to pooling, or collective management.

19,055. I am thinking of the question of joint control as between the owners and the workmen. You gave a very strong view that in respect of the technical management of the mine dual control between the manager and the workman is impracticable. I am putting this particular point to you. Can you think of any other point in connection with the working of a colliery undertaking as between the owner and the men where joint control would be practicable?—I do not quite follow you. I think the men ought to be associated with the owners in the control of the industry; but I do not say that that means that the men are going to take part in the technical management of the mine.

19,056. Do I understand you to mean that there ought to be a considerable amount of co-operation between the parties?—Certainly more than there is at present.

19,057. That co-operation not going the length of interfering with the management of the collieries?—No. I think I made it quite clear in my *précis*. I think there should be these committees set up which would be advisory or consultative committees.

19,058. May I take it when you said you agreed with Sir Richard Redmayne about joint control, you were thinking really of co-operation between the owners?—I was.

19,059. And not really between the owners and the men?—Yes, that is the point raised. That is dealt with in Sir Richard Redmayne's evidence in his answer to question 5,208.

19,060. You mean it was with regard to what you would call the efficient handling of the smaller units so as to prevent waste of coal?—It might be some of the larger units in some respects.

19,061. But in respect of aspects of waste?—Waste in energy and waste in coal.

19,062. But not really as between the owner and the workmen? That was the question that was involved. Would you agree?—I do not quite follow you. I do not see the point you are trying to make.

19,063. You said you agreed with Sir Richard Redmayne's evidence?—Yes.

19,064. So far, I take it that your agreement was in respect of questions between owner and owner?—Yes.

19,065. And in respect of questions of waste?—Yes, what he called waste and extravagance.

19,066. But not in relation to questions between the owner and the worker bearing upon the control of the mine?—From the technical and the safety side.

16 May, 1919.]

MR. WILLIAM WALKER.

[Continued.]

19,067. Not bearing on the control of the mine?—I do not think that arose on that question.

19,068. With regard to the efficiency of British mines generally, do you agree that on its technical side it is of a high order?—Yes, generally.

19,069. Would you say generally it sets an example to other industries?—I should like to qualify that by saying that much more can be done.

19,070. That is to say, there is no industry that is perfect?—I do not suppose so, though I do not know.

19,071. We have all to go on advancing as rapidly as we can?—I do not know anything about any other industry, but there is much to be done with regard to coal mining.

19,072. After all you will agree that efficiency is a relative term?—Yes.

19,073. Comparing this country with other countries—I have no doubt that you have considerable experience of mining in other countries—you think we have nothing to be ashamed of on the technical side of our management?—Generally, no.

19,074. *Sir Arthur Duckham*: You have had experience of the pit committees on safety?—No, we have not, because they are not appointed; what we are anxious to do is to get them appointed.

19,075. Are there not some working in the country?—I do not know of any.

19,076. I understood that there were some working in Nottinghamshire?—I have not heard of them; there may be pit committees, but not pit safety committees.

19,077. Do you know of any pit committees where the management and the men are working together for the safety of the men?—No, I have not heard of them; they have not been in my department.

19,078. *Sir Allan Smith*: We have had some evidence put before us as to the value of the experiment on nationalisation in Queensland. Are you aware of the extent to which the State owns mines and works them in Queensland?—I am not.

19,079. Is there any publication which would give us that information and which you could procure?—I will see whether I can procure the information for you.

19,080. If you could, would you let us have a copy of that and lodge it with your evidence in order to show what the experience has been and the extent?—I will.

19,081. With regard to the figures, you show that there were 2,019 persons employed in collieries in Queensland. That does not indicate to us that there is a great deal of industry that is to be nationalised or can be nationalised in Queensland?—That was in 1912.

Sir Allan Smith: I think, Mr. Chairman, it might be as well if the Home Office would give us as much information on that as they can.

Mr. Sidney Webb: We have had it given in evidence by the Premier.

Chairman: We will certainly get it.

Sir Allan Smith: I should like to have a report by the Queensland Government as to the extent to which they do work their own mines, and the details of the arrangements they have.

Witness: My table shows that the output was 916,000 tons, which is practically a million.

19,082. *Chairman*: What is the number of men employed in Queensland?—2,019.

Chairman: That shall certainly be got, *Sir Allan*.

19,083. *Sir L. Chiozza Money*: May I ask you if you have any record—I am speaking of 1913, pro-war—of how many mines were thoroughly inspected in that year?—By “thoroughly” do you mean from one end to the other?

19,084. Yes—a real thorough inspection in the literal meaning of the word.—I do not know whether I have actually that information, but I can get it. I mean it is not with me here.

19,085. Have you not any recollection of the kind of figure it is?—I can show you the number of inspections made by the inspectors.

19,086. That is what I mean?—But I do not know that I can say that every one included the whole of the mine.

19,087. They would be visits?—They would be inspections.

19,088. Would you mind giving us that figure?—Yes, I will give you that. I can give it to you for 10 years—1909 to 1918—the number of mines in which underground inspection was made. I can put this Table in.

19,089. Will you give us the figure for 1913?—15,000 inspections made underground.

19,090. That is less than half of the number of coal mines?—No, 15,000 inspections.

19,091. How many of those would be what I would call a thorough inspection of the mine, in which the inspector would satisfy himself that the mine as a whole in all its parts was in good working order and was, as you say, worked properly under the Coal Mines Act?—It is very difficult to get the information, but I think you may take it that each mine is thoroughly inspected once a year—many of them—I should think, oftener. Of course the appointment of the sub-inspectors was for the purpose of making these thorough inspections, but the war has interfered with them. They were only appointed in 1913.

19,092. I quite understand that. Of the number of inspectors that you give us how many are employed solely on coal? You name 89 inspectors in 1914: how many were inspectors of coal and not solely inspectors of horses?—In my *précis* I give the number of inspectors of horses and quarries—the others, except two metalliferous mines inspectors, are all coal.

19,093. On the point that was raised just now I did not clearly hear your answer to *Sir Adam Nimmo*. Did I rightly understand you to say that in your experience you came across cases in which, through the disjointed management of coal, there was waste in the working?—What I said was that I agreed with what *Sir Richard Redmayne* said in reply to Question 5208, with regard to the present management of coal mines, that it could be very much improved from the point of view of energy, so far as the management is concerned, and could give a better result.

19,094. You mentioned rather a striking case where there was actual waste?—Let me illustrate it by this book, calling this the area where the collieries are working, and say the shafts are near one end of the Royalty. That is working its coal all the way from the shaft to a distance of probably two miles. Just over the boundary there is coal available to be worked which is being worked by a shaft which is just as far away from that coal as these shafts are working in the present area. My point is that the coal just over the boundary should be worked to these nearer shafts.

19,095. Because of the disjointed ownership and management this waste occurs?—The present owners of this lease have not the right to work the coal over the boundary.

19,096. Then you do agree that there is a good deal to be done in co-operation between owners under some form of joint management?—I do.

19,097. Which could obviously be effected by nationalisation?—It might be effected in that way or by co-operation under the present system.

19,098. However it was effected, there is great room for it?—There is room for it.

19,099. On the other point that you were asked about, as between masters and men, do you see advantages in the form of working which would bring about co-operation between the management and the actual workers in the control of the industry generally?—I see no objection if they do not interfere with the control of the manager.

19,100. That is to say, your objection, if I may put it so, is solely from the point of view of the direct responsibility of the manager for the safety of the mine?—And technical management.

19,101. *Mr. Sidney Webb*: I want you to give us, if you would, a little explanation about the accidents. You pointed out that the death rate in the mines has fallen, and that it does not compare unfavourably with that of some other countries, but you do not give us any information about the non-fatal accidents, which, of course, are a hundred times more numerous than the deaths?—They are not available for these countries; we have not them.

16 May, 1919.]

MR. WILLIAM WALKER.

[Continued.]

19,102. With regard to this country, you have them?—I have already supplied a table showing what they were.

19,103. The non-fatal accidents?—The non-fatal accidents for a term of years.

19,104. Is that going to be circulated?—It was sent to the Commission.

19,105. Could you tell us what the general result is? I do not want you to read it, but give us the numbers for the first year that you have?—I have taken the non-fatal accidents per million tons raised. From 1895 to 1899 it was 21; from 1899 to 1904 it was 15.5. For 1905 and 1906, 13.5; from 1907 to 1911 it was 19.8, but in the year 1907 there was a large increase in the number of non-fatal accidents reported, owing to the operation of the more definite requirement laid down in section 2 of the Notice of Accidents Act, 1906. I made a break there to show how that occurred. From 1912 to 1916 it was 17.4, for 1917 and 1918, 17.2. Of course, those are the accidents reported to the inspector.

19,106. Those are all the accidents reported to the inspector?—Yes, but there is also another type of accident, that is the accident involving seven days' disablement.

19,107. How many years do you give those for?—Since it has been necessary to supply it, from 1908 to 1914; in 1908 it was 513.8

19,108. This is the total number?—This is the accidents per million tons.

Sir L. Chiozza Money: Can we have the total number?

19,109. *Mr. Sidney Webb:* Let Mr. Walker go on?—1909, 549; 1910, 569; 1911, 581; 1912, 549; 1913, 585; 1914, 568.

19,110. That is to say, these accidents involving more than seven days' disablement have not decreased in the last 11 years; for whereas they were 513 in 1908, they are 568 in 1914?—That is so.

19,111. You might almost say that there has been an actual increase?—I think that is due to the conditions.

19,112. To what conditions?—That you are working at a greater depth.

19,113. That is the fact?—Yes.

19,114. You feel sure that these figures represent the general result, that there are more accidents per million tons involving disablement for seven days and upwards than there used to be?—Than there were, say, in 1908.

19,115. We cannot go further back; but, even if you take this figure further back, as to all the accidents reported to the inspectors, there is not any very conclusive proof that they are being reduced. Your curve is a little varied?—Very.

19,116. *Sir Malcolm Delevingne* mentioned in his proof that the accident rates have steadily diminished. I take it he meant by that, the fatal accident rates?—Yes, I think he said so.

19,117. Is it not a little misleading to call it the accidents rate?—He was referring to the fatal accidents.

19,118. In your report, you refer to accidents when you mean fatal accidents, all through?—Before the war we always published the fatal and non-fatal accidents in the reports, but since 1914 the fatal accidents are only given.

19,119. Would it not have been a little significant to have given the non-fatal accidents which are rather serious?—We do give them: we give the numbers.

19,120. You have not compared one year with another?—Yes, we do.

19,121. In this Part 2, Labour, you confine yourself to fatal accidents?—That has no reference to any of these accidents, because they have not been published during the war.

19,122. Why have they not been published during the war? The casualties at the front were published?—Yes, but the clerical staffs at the collieries had gone to the front, and the colliery people could not do it.

19,123. That is an explanation, but that is not stated here as the explanation. You refer to acci-

dents here throughout when you mean fatal accidents?—Yes, all the death-rates are worked upon the fatal accidents.

19,124. I am not talking about death-rates; I am only saying you head this "accidents," and it appears you do not mean accidents, but that you mean "fatal accidents"?—I think we do record the accidents that are reported to the inspector.

19,125. I want to know why you do not include here, when you say "accidents," any but the fatal accidents. If you look at Part 2, Labour for 1914, and take the first passage on p. 70, the table of contents, and look at the statistics of "Accidents at Mines," you will notice in that table of contents you say, "Accidents at Mines"?—Yes.

19,126. Then if you look at p. 88, you have section 2 headed "Accidents"?—It is quite correct, I think.

19,127. Except that the section has nothing to do with accidents?—If you read it through in the reports for 1917 it is made quite clear that it refers to fatal accidents. Before the war both the fatal and the non-fatal accidents were given in the reports.

19,128. Is it not misleading that it should be headed "Accidents"?—No.

19,129. Would you be surprised to know that a London editor the other day, when I said there were 160,000 accidents, said that when he was reading this, he concluded there were only 1,300?—I am surprised. It only shows that he had not read it.

19,130. On this point, with regard to accidents, apparently accidents involving more than seven days' disablement are not diminishing, but rather may be said to be increasing. Is not that so?—Yes; they are about the same.

19,131. If you compare 1908 with 1918, you have an increase of 513 to 516 per million tons, which is a very substantial increase?—I should have some doubt as to the 1908 figure.

19,132. If you take 1917, they were 585, which is an increase of some 18 per cent. I do not want to take any particular year, but you will see there is a very substantial increase?—Yes. You say, taking 1917, it was 17.2.

19,133. I am not talking about accidents reported to the inspector, but these other figures which are more accurate, as you told me—the figures as to accidents involving seven days' disablement?—I have no figures for the accidents in 1917 involving seven days' disablement.

19,134. I thought you read them out to me?—No, we have not had them during the war.

19,135. Take 1914; what are they?—568.

19,136. That is a very considerable increase on 1908?—I say that I have some doubt about the 1908 figures, because it was the first year in which it was necessary to report, and the accidents at the collieries may not have been kept quite so carefully as they were in the later year.

19,137. We should not be warranted in making the optimistic inference that the number of accidents is diminishing?—The non-fatal accidents are not on these figures.

19,138. You rather suggested to the Commission before that the non-fatal accidents follow the same courses as the fatal accidents?—I personally have no doubt about that.

19,139. On these figures?—My experience is that if you have a safe pit from fatal accidents, it is usual that there are less non-fatal accidents.

19,140. After all, you are not an expert on figures?—No, but I know something about pits.

19,141. You have two classes of accidents; you have the one, the explosions, and the explosions, when they occur, are very fatal, are they not?—Large numbers of deaths are involved.

19,142. But the point is that the proportion of deaths to non-fatal accidents in an explosion is very high?—Yes.

19,143. Twenty or thirty per cent.?—Yes.

19,144. Then you have a very large class of accidental falls from roofs?—They are the largest.

19,145. You know the proportion of fatal to non-fatal accidents there is very small, that is to say, you

16 May, 1919.]

MR. WILLIAM WALKER.

[Continued.]

have 600 fatal accidents and 62,000 non-fatal?—Yes; but might I say this, that the number of accidents from explosions are very few as compared with the others.

19,146. I know that perfectly well, but I put it to you that, supposing you have had a diminution in the number of the explosions without a diminution in the number of falls of roof which have nothing to do with explosions, the result would be that you would have a greater fall in the number of fatal accidents than you would have with regard to non-fatal accidents. However, you do not follow that?—I do not agree with you.

19,147. May I take you to the relative number of accidents in this country and other countries, and here we are confined to fatal accidents. Do you not think it was a little complacent of you to rely so exclusively on the comparison with Belgium? You pointed out that there was only one country of any size which was superior on these figures, if you took the proportion of fatal accidents to tonnage, and that that country was Belgium. The next to Belgium is Austria. Is not Austria also superior to this country? Take it, for instance, on your percentage per 1,000 persons employed: you will see that Austria is 10 per cent. better than this country, on the average of ten years?—Yes.

19,148. Take it on the tonnage raised: you will see on the average of ten years Austria is 20 per cent. better?—I would make the same remark as to Austria as I would about Belgium.

19,149. What is that?—That, compared with our output and our areas, the number of mines, it is very much less, and I can pick out areas here that are better than that.

19,150. Do not you think that Austria can pick out areas that are better than some of ours here?—I do not think so. I can pick you out a group of collieries in this country where the figures are better, I think, than any in other countries.

19,151. Still the fact remains that if you take the seven biggest coal countries in the world, we may be superior to four of them, but we are inferior to two of them?—I grant that the figures in Austria as to death-rates are better to the extent that this table shows.

19,152. Now would you mind explaining a little more about the safety committee? You are quite in favour of a safety committee, provided that it does not interfere with the management?—I am.

19,153. I do not know whether you agree with Sir Malcolm Delevingne that the Manager must have a free hand with regard to the prevention of accidents. Sir Malcolm Delevingne said that the question of safety is so inseparably connected with that of the technical management that it would be disastrous to attempt to divorce them?—I entirely agree.

19,154. Consequently, when your Pit Committee is going to consider how to prevent accidents it cannot be prevented from considering the technical management?—I should consider safety provisions.

19,155. You have just explained that safety provisions cannot be divorced from technical management?—It should consider safety provisions.

19,156. Therefore, in considering safety conditions the Committee would also have to consider technical management?—Some of it.

19,157. Is there any line that you can draw?—So far as it affects safety?

19,158. You have explained to me that it is inseparably connected with technical management and cannot be separated?—My object in favouring the Safety Committee is to reduce accidents.

19,159. I quite understand that you hold very strongly that they must not be allowed to interfere with the executive control of the Management?—In any event.

19,160. I put it to you that if you get your Safety Committee you will not be able to prevent them criticising and discussing the technical management, because they will say, as you have said, that you cannot separate the safety from the technical management?—That may be.

19,161. I think you mention that it would be a good thing, you think, if there was a Joint Com-

mittee to manage the baths at the pit-head?—That is provided now by the regulations.

19,162. Pardon me, it is not; it is only provided by regulations for the baths which are set up under that Section, and you have told me there are no baths under that Section?—So far as the provision of the Mines Act relating to baths is concerned, baths would be managed by a Joint Committee.

19,163. I think we know that. I am much obliged to you for the information, but you have just told the Commission that there are no baths set up under that Section?—Yes.

19,164. Then you have also said there are some cases in which baths have been set up?—I have.

19,165. You have also said in no one of those cases is there a Joint Committee?—Yes.

19,166. And you suggest it would be better to have a Joint Committee?—Yes.

19,167. Therefore, you wish to have Safety Committees and also to have Joint Committees for the management of pithead baths where they exist?—I quite agree.

19,168. Are there any other things that you think the Joint Committee might act in?—I think anything in connection with the safety of the workers.

19,169. That is where we began. It is quite clear they are going to do that; they are also going to discuss the technical management of the baths. Is there anything else?—I cannot think of anything else. It depends on what happens at the pit.

19,170. They would discuss what happened at the pit?—Anything affecting them.

19,171. Do you see the advantage of greater co-operation of pit committees which would discuss anything relating to the pit, provided it did not interfere with the management?—Relating to any matter that might affect the safety of the workers.

19,172. Then shall we go over it again?—I do not think we should agree if you went over it as often as you like. I know your point.

19,173. You have told the Commissioners that you think the workers ought to be able to discuss anything that affects them?—No; I will correct that, and say that affects the safety.

19,174. Do you agree with Sir Malcolm Delevingne that you cannot separate the safety from the technical management?—I do.

19,175. If you cannot separate the safety from the technical management you cannot separate the discussion on the Pit Committee of Safety from its discussion of technical management?—There would be questions on the technical management of the mine, such as the wages that are paid for doing certain work.

19,176. Is it wages you think they ought not to discuss?—I think they should not be brought into these questions in connection with safety.

19,177. Is there any objection to the workman discussing wages?—No does it now.

19,178. I mean in these committees?—I think it is far better to keep it clear: it only leads to difficulty and friction in the committee.

19,179. You said you agreed with Sir Richard Redmayne when he said that the individual management of the collieries was extravagant and wasteful, and you gave some instances?—Yes.

19,180. The suggestion is, I suppose, there should be more joint management in groups?—There should be closer co-ordination.

19,181. Would you think it desirable that groups of mines should be managed jointly or directed jointly?—I do. I think at the present time there are many collieries, clearly, that could be joined together.

19,182. Supposing there is a district in which there was joint management to put an end to the present extravagant and wasteful system of management, would you think there would be an advantage in having district councils on which the workmen were represented to get co-ordination between the workmen and the managers?—I agree with Sir Malcolm Delevingne in reply to that question, that it might be productive of great good.

16 May, 1919.]

MR. WILLIAM WALKER.

19,183. In the central management at Whitehall, would you think there was any advantage in your having representatives of the workmen to assist the Home Office in its work?—In an advisory capacity, yes.

19,184. We are all in an advisory capacity to the Secretary of State?—I suppose so.

19,185. They would be in the same capacity as you or other officials of the Home Office; they would be giving advice to the Secretary of State?—This is assuming the mines are nationalised.

19,186. Assume that for the moment. You see advantages in central councils in which workmen would be represented and in district councils in which workmen would be represented and in pit committees in which workmen would be represented?—If the State are going to carry on the industry.

19,187. *Mr. Robert Smillie*: I take it you have made yourself acquainted through your long career as an inspector of the early history of the appointment of Mine Inspectors?—Yes, I know that.

19,188. Have you happened to have read Boyd on Mining Inspection?—I do not think so—I do not remember it.

19,189. Boyd is taken as an authority with regard to mine inspection. Do you know it was put to a witness here that when it was proposed to take the little children and women out of the mines, they appointed inspectors for the mines, and that Lord Londonderry, with other mine owners, bitterly opposed it?—I believe he did.

19,190. Do you know he was quoted as saying that if the first Bill of 1842 was carried through in its present form it would make it impossible to work the mines if the children were taken out?—Yes, I have heard that.

19,191. I will read you his words: "If passed in its present form, it would entirely prevent the working of many of the most important coal mines in this country." Do you know, at the time the Bill was before the House, some persons on behalf of the colliery owners stated that if women were taken out of the mines it would make it impossible to work some of the mines?—Yes.

19,192. Do you remember coming across that?—I have heard that statement before.

19,193. Do you remember, when the Bill finally became law and inspectors were appointed, Lord Londonderry, in the House when the Bill had been passed by 49 votes to 3, said, and his last words were, that he would say to such an inspector: "You may go down the pit how you can, and when you are down you may remain there"?—Hard on the inspector.

19,194. It would have been hard on the inspector?—He would have been lost—buried.

19,195. Are you aware that under the 1842 Act the inspector had not a right to go down to inspect underground at all?—Yes.

19,196. His work was confined to looking after the social condition and the position of the people on the surface?—I believe that is so.

19,197. Are you aware that in 1850 it was found necessary to again bring in and carry through an Act of Parliament dealing, amongst other things, with inspection? Are you aware that Lord Londonderry opposed it bitterly, as he had previously opposed the Act of 1842, and said he protested against the Bill as the most mischievous and unjust measure that could possibly be imagined?—I do not remember exactly he said that. I know the introduction of inspection was objected to by owners of collieries.

19,198. Are you aware when the Act of 1850 was passed the Act of 1842 was repealed, and we had two systems of inspection running side by side, the Inspector appointed under the Act of 1842 and under the Act of 1850; and, consequently, right up to 1860 there was an inspector supposed to look after the well being of the mining population on the surface, side by side with an Inspector of Mines, whose duty it was to inspect underground?—I believe that was the state of matters.

19,199. From 1850 to 1860?—Yes.

19,200. I think it may be taken that, generally speaking, and, while it ought to be admitted that

some mine owners were as anxious for a reform as any persons in the country, many mine owners bitterly opposed what they were pleased to term interference with their rights of owning the mines?—That was the feeling at that time.

19,201. Have you heard something very like that same kind of argument used in this room during the past few weeks?—I have not been here much.

19,202. Have you been reading the papers?—I do not find it all reported, after one hears the evidence. I may not have seen that. There was objection, I know.

19,203. It has been said if the coal mines of this country were taken over by the State, and worked by the State, the probability is it will be ruinous from the point of view of the State?—I have heard that suggestion.

19,204. Do you think the State could not work the industry providing it got the assistance of the men who are now managing private enterprise?—I daresay they could; but I do not know whether it would be as efficient as it would be under a system such as is set out in Sir Richard Redmayne's evidence.

19,205. May I take it the managers of the mines in whose hands you insist the responsibility shall lie—it is the managers of the mines that manage the mines and not the directors of the firms?—Yes, the managers and the agents who are technically qualified. I am only saying this as to the management of the mines. There is a very large question after that; there is the marketing and the selling of the coal.

19,206. Quite. Would you say it was the directors or shareholders who do that? Are there not managers on that side of the business too?—I should think the directors take a very large share in the management, so far as the second part which I have mentioned is concerned.

19,207. There is only a small proportion of the shareholders in the mining industry to-day that go down to produce coal?—Very few, I should think.

19,208. There are only a very few of them who are managers carrying on the collieries?—There would be some.

19,209. There are not many of them who go to sell the coal?—Not managers—no.

19,210. Do not they leave the commercial side, as well as the technical side, in the hands of other people largely?—I should think not the commercial side. I should think the Board of Directors does do something in that way.

19,211. Boards of Directors sometimes meet quarterly, sometimes monthly?—And sometimes oftener.

19,212. From your personal experience or your knowledge have you found there has been any very earnest desire on the part of the vast majority of mine owners to introduce safety appliances of all kinds in the mines?—Some owners, yes. There are exceptions, of course. The Act, so far as the provision is concerned, is based on the best practice.

19,213-4. I have stated in your presence again and again that most mining regulations are for the purpose of bringing out the worst conditions with the best?—I quite agree. Taking, for instance, the provision of an over-winding preventer. I think you could count the number of mines at which that apparatus was installed before the introduction of the Act upon your hands.

19,215. It would not be 2 per cent.?—I should not think it would be any more than the number I have indicated. I should not say more than a dozen did it.

19,216. And serious winding accidents were taking place from time to time which could have been prevented if the known apparatus had been applied?—I am not sure there was an apparatus known much before the date when the Act came into force.

19,217. As a matter of fact, you are aware of the fact that controllers were fixed to engines 10 or 15 years before the Act came into force?—Probably 10 years. The only colliery I knew where they were on was the Florence Colliery.

19,218. I knew they were on at Douglas Water Colliery from the first time?—There may have been cases I have not heard of.

16 May, 1919.]

MR. WILLIAM WALKER.

[Continued.]

19,219. I want to put it to you that from time to time after the whole mining world knew there were controllers and detaching hooks accidents took place. Do you now remember the accident that took place at Bellshill, where four men were killed?—Yes.

19,220. It was known to mining engineers that they could have prevented that?—Yes, and but for the Act they would not have been universally adopted.

19,221. As far as detaching hooks and controllers are concerned, has it not been the same thing with regard to every other safety appliance, and it was only applied in 1 per cent. or 2 per cent., perhaps, of the cases of colliery owners in the country. They were forced by legislation on every occasion to take the precaution?—The proportion would be higher than 1 per cent. or 2 per cent. of the mines, when the managers would adopt everything which would increase the safety of their miners.

19,222. Let me see if you are correct in that. Tell me how many mines in this country were in a position to reverse their air current in the event of a fire in the downcast shaft or the upcast shaft when the Act was passed?—The fans were not arranged so that you could do it at more than one or two.

19,223. Do you know where there was one?—The only one I know was the one at Dalquhandg.

19,224. That is all anybody else knew?—There were methods of reversing air in existence other than the fan by putting water down the pit, and that sort of thing, and it was done before.

19,225. Will you keep your mind on the question. It is of great importance, and to you especially, as an Inspector. Do you know the inventor of that particular method of reversing air current read a paper before the Mining Institute of Scotland 16 years before the Act of Parliament made it compulsory?—I do not remember that was so. I take it from you he did.

19,226. And the first pit he sunk after that he put in his reversing apparatus?—Yes.

19,227. And it was many years after that before the Act was passed. It was only because of the passing of the Act that we have the reversible machinery now to reverse air. That is one case in which there was not 1 per cent. or 2 per cent.?—I do not know of any other case.

19,228. The same thing applies to detaching hooks and controllers?—No, not to detaching hooks and controllers; it may to Scotland. Prior to the Act passing most of the managers in England and Wales had detaching hooks.

19,229. The Mines Act says when a mine is a certain depth they must have both. How many had both?—Very few. You can probably count them on your fingers.

19,230. Do you know anyone who had both prior to the Act?—I knew of some in Yorkshire.

19,231. Which had detaching hooks and controllers?—We had a very bad accident there owing to the mistake of the engine man, and the whole question was gone into, and the result was controllers were put on before the Act came into force.

19,232. Are you aware of the fact that at the present time there is a little thing which has been patented which enables a person to withdraw the detonator in the event of a mis-fire?—I know the P.P. apparatus.

19,233. That is Price & Price?—Yes.

19,234. Do you know whether it has been adopted at any of the collieries?—I have made enquiries recently, and I do not find it has been used at any colliery.

19,235. Do you think it would be useful to prevent accidents arising from mis-fire?—Prevention of mis-fires is provided for by the Home Office Orders. The P.P. is only an alternative method of dealing with mis-fires. Its use is only allowed by special exemption, and if we were not satisfied, that exemption would not have been granted.

19,236. I should like to read to you a couple of letters. I will not give the names of the parties, as that would not be fair. You may take it they are from colliery companies: "We are much obliged by your letter of the 25th. We have considered this matter very carefully recently and came to the

conclusion the benefits to be derived from your apparatus do not justify the large increased cost of using it." Here is a second most magnificent letter: "I am much obliged to you for your letter of the 25th. I do not think there is need for further demonstrations at our pit. As our manager has told you your contrivance is very satisfactory;" and then it says: "The sole question with us is the matter of cost."—Yes.

19,237. Is that the kind of way that not only this safety appliance, but all other safety appliance, have been treated. Should the cost that would be involved here, briefly one-tenth of a penny a ton, stand in the way of every known appliance being used that would tend to lessen accidents?—Cost should not stand in the way of safety in any way.

19,238. Would I be right in saying it has stood in the way in the past?—I do not know. In some cases it may, but my experience generally is the managers of the mines in this country are desirous to adopt safety contrivances.

19,239. These managers?—Yes.

19,240. There is somebody behind the managers that may not be?—He must get the money with which to buy the thing.

19,241. Certainly, that is the reason why we want to nationalise the mines, because the present system stands in the way of the managers getting proper facilities for looking after the safety?—It is not necessary to nationalise the mines to get that. That can be got in any way. I am not expressing any point as to whether it is necessary to nationalise or not in my answer.

19,242. If it is true the managers, as you say, generally speaking, of this country are anxious to use every precaution, and mind you, I agree with you, to lessen as far as possible accidents, fatal and non-fatal, and the question of cost stands in their way, is it not time a change took place of some kind?—If that is so, it wants altering.

19,243. I want to put it to you that when the last Mines Act was passed we had several weeks on the question. May I take it the special roads are as important as the Act itself, as far as the safety is concerned?—Yes.

19,244. It means the carrying out?—Yes.

19,245. Did not the Miners' Federation on the one hand and the employers, the Mine Owners' Association of Great Britain on the other, fight for weeks and weeks before Lord Mersey—the miners for the adoption of safety precaution and the mine owners to avoid adopting safety precaution?—We were parties to that reference.

19,246. There was a third party, the Home Office?—We were there.

19,247. They were anxious about the mines?—Yes.

19,248. They expressed their opinion that certain things were necessary. Did not the miners desire to join their forces with your own to get those done?—Probably.

19,249. You did believe in joint management in that case?—In getting regulations carried?

19,250. Yes?—We are always glad to have the support of the miners in that.

19,251. I want to put this question to you, because statements have been made or hinted that the mining community are not sufficiently intelligent to take any serious part in the management of the mines, either commercially or technically. May I point out there are a very large number of miners who hold first-class certificates at the present time, who are working at the coal face or as colliery firemen?—That is so.

19,252. I think I called your attention to the fact that in one colliery in the Hamilton district there were five men acting as firemen who hold first-class certificates?—Quite.

19,253. Do you think men, especially miners, who spend all their spare time in getting an education which enables them to pass with a first-class certificate are too ignorant to take any part in carrying on the mines of this country?—No, I could not agree that everybody who gets a first-class certificate is capable of managing a mine.

16 May, 1919.]

MR. WILLIAM WALKER.

[Continued.]

19,254. Neither would I agree that every director of a colliery company could be capable of managing a mine?—I quite agree with you.

19,255. They are capable of being directors?—Yes.

19,256. And they are capable of dictating to the manager of the mine, and do it?—Then they should not, according to the Act.

19,257. You know they do, whether they should or not?—Sir Malcolm Delevingue the other day said there were some in which—

19,258. *Mr. Sidney Webb*: Not infrequently?—In which there was interference.

19,259. *Mr. Robert Smillie*: I have been in collieries where the manager let me see his cost sheet, and it was marked in red ink at the point where the cost would have to be brought down; a peremptory order that those costs would have to be brought down. I have reasoned with them and said would it not interfere with safety, and they said it would. I think that that is an interference with the management of the mine. I think *Mr. Evan Williams* or *Sir Adam* touched upon this. With regard to the class of Sub-Inspectors, they, generally speaking, are very good men?—They have been successful.

19,260. Many have been practical miners?—Yes.

19,261. Risen from the ranks?—Yes.

19,262. Do you think they have risen from a position of coal-getters to a position of sub-inspectors—what are their salaries?—Some of them have been promoted to be junior Inspectors. They are available, if they are fit for it, to be promoted.

19,263. Would you tell us what those sub-inspectors were appointed at prior to the war?—I am not quite sure of the figures. I think the minimum is £150, increasing by yearly increments to £200, without war bonus.

19,264. They must hold a first-class certificate?—First or second.

19,265. And they require to stand an additional examination before they are appointed?—There is an examination.

19,266. The maximum is £200?—Pre-war, yes.

19,267. That would be a less salary, generally speaking, than the manager of mines whom those men have to inspect?—Without in any way saying anything derogatory in regard to the sub-inspectors, I regard them as being equal to the under-manager of a mine.

19,268. I know some of them?—I know the records of them all.

19,269. I rank them against 90 per cent. of the managers that I know of who manage mines?—Some of them have actually been managers and left their position to take up their present position, so I take it they were getting more salary even than a manager.

19,270. I put it to you the persons who are selected to be a sub-inspector of mines ought to be the very best men we can get?—I agree.

19,271. Or else they have no right to go down and advise the managers of a mine, if they are not at least equal to him himself? Do you think the Government could hope to get the kind of man for that work at £200?—We could pre-war.

19,272. You could expect it?—We did.

19,273. That must prove another statement I have made that the colliery managers in some part of the country were very lowly paid?—There is no doubt about it that they were.

19,274. Have you any knowledge what their salaries ranged in Scotland?—I remember going to one colliery in Scotland and asked a manager if he would tell me what he was getting, and he told me £3 a week. You know that colliery.

19,275. What is the size of that colliery?—400 tons a day, perhaps.

19,276. It would not be an exaggeration to say that a large number of men in Scotland hold first class certificates and manage mines from 200 to 300 on £200 a year before the war?—Yes.

19,277. Would not some be amazed if they were raised to £300 a year?—I think the manager in Scotland was paid very badly. I understand that has been raised recently.

19,278. They were going to strike unless they got something to keep their families upon. It had to be forced by the threat of a strike?—I agree the manager in Scotland was paid far too little.

19,279. Do you repeat your answer that the Government is entitled to expect to get the best class of man as sub-inspector at £200 a year pre-war?—In connection with Government service there are advantages which you have not in private service. Continuity of employment is one. You very seldom get rid of a man. The other is he has his pension at the end of his service, which he has not in managing a colliery.

19,280. You think there are compensating advantages?—If he dies his wife gets a certain amount.

19,281. *Mr. R. W. Cooper*: What does the widow get?—A year's salary.

19,282. What is his pension age?—He can retire at 60; he must at 65.

19,283. *Mr. Robert Smillie*: I want to bring you somewhere near to what we are dealing with here. Do you think that every mine in Great Britain under the Mines Act could be thoroughly examined once every twelve months with the present staff of inspectors?—I hope so.

19,284. We know better, you see. The miners appoint from time to time two men to examine the mine. You would be surprised to know it takes them 8 days to examine some of the mines?—Probably.

19,285. Would you be surprised to know that even in little mines it takes two days to make a thorough examination of them?—Some do. With regard to the Home Office Inspectors you have sub-inspectors who make inspections in an area and another follows on. In that way you get the greater part of a mine inspected once during a year. In Scotland when I was in charge there most of the mines, or a good few of the mines, were inspected by Home Office Inspectors from the downcast shaft to the top of the upcast shaft.

19,286. That does not mean a thorough inspection of every place in the mine?—It did. At least, I hope it did. Those were the reports I got.

19,287. All this was in the interest of safety. The miners know the Mines Inspector cannot inspect everywhere under their charge once in 12 months or two years. They make a thorough inspection of them, and, as a matter of fact, the Mines Inspector does not profess to do it. It is only parts of the mine, and he takes it for granted the other parts are up to sample?—That was before the appointment of sub-inspectors. I regret it has been so owing to difficulties through the war. We have had inspectors away on active service. We do expect to get from the sub-inspector an actual inspection of the greater part of each pit.

19,288. I am not complaining at the present time, because your staff, like everybody else's in the country, has been terribly upset, and a very large proportion of your people went away?—Eighteen went.

19,289. I put it it is very essential indeed that there ought to be from time to time a thorough inspection of the mines?—Yes, I agree. The inspectors from time to time inspect the greater part of the pit to see the condition of that pit.

19,289A. That is only to see whether or not the Mines Act controls are being carried out?—Yes, during that inspection.

19,290. The Mines Inspector might not be safe home in his own house from the pit before something might go wrong which he had not foreseen was there?—Yes.

19,291. If the mines were nationalised, in all probability there would be a larger staff of inspectors. Do you think a larger staff is required?—I do not know; it is difficult to say. You would have to have the scheme laid down as to what the inspectors were to do from the safety side and what was to be done, and then practically this means that every manager under nationalisation is a State employee.

19,292. A manager would be an employee of the State?—The same as the inspector is now.

19,293. Do you think there would be so much trouble in keeping the managers of the mine up to date if they were State employees?—I do not know, it might be just as difficult as it is now.

16 May, 1919.]

MR. WILLIAM WALKER.

[Continued.]

19,294. Is it a difficult matter for the Government to keep you up to the scratch?—I have not any opportunity of getting out of the straight line; there is too much to do.

19,295. You do it?—There is a certain amount of control required with any staff.

19,296. I think you are doing your very best to serve the State in the interests of safety?—I hope so.

19,297. You may take it from me, my experience in Scotland is that you did everything possible in the interests of safety. Do you think it is an incentive to gain?—From the inspectors' point of view, there is the human side. You are trying to increase the safety of the mine and trying to improve the conditions under which the men work. That is sufficient inducement.

19,298. You have not been getting out figures with regard to the non-fatal accidents during the war?—Not seven-day accidents.

19,299. Is it impossible to do so because of the work on your staff?—And on the owners' clerical staff.

19,300. Have you any indication that there has been a large increase in the non-fatal accidents during the past four years?—I have no information as to that. I have not gone into it.

19,301. Would you expect under all circumstances, many outside persons going into the mines and the strain on the management, that there might be?—I would.

19,302. You have twice given this reply, that because of the greater depth the probability is there are more accidents taking place now?—Yes.

19,303. And consequently you would not be surprised to have a larger number because of the conditions underground?—I think the conditions may have raised the rate.

19,304. Has it really been the experience of the mining movement in this country that the number of non-fatal or fatal accidents have been larger, keeping explosions out of it, in the deep mines than in the shallow mines. Has the reverse not been the case?—I think not, but I have not taken the figures out. Taking a mine that Mr. Smith knows very well in Yorkshire, which is a deep mine, the Cadeby, where they have a had roof, I imagine the number of non-fatal accidents from falls of stone and cuts, which would disable a man for seven days, are in excess of a mine where they are not so deep and the conditions are better.

19,305. You have not compared two countries in one of which the mines are comparatively shallow and the other very deep?—I have years ago.

19,306. Did it justify your statement that the deeper the mines are the greater danger of non-fatal accidents?—I am sure at the depth we work coal now there is far more reason for non-fatal accidents than there was in the shallow mines.

19,307. I put it to you you ought to set off against greater depth of the mines when dealing with the accidents this fact—that hundreds of things have been introduced to-day for the prevention of accidents that were not introduced 15 or 20 years ago, surely that accounts for a lessening of accidents?—I agree it does, we claim for the provisions of Mines Acts that they have reduced the death rate from all causes since they were introduced due to the precautions that are necessary, and the several precautions that have been introduced by the managers themselves.

19,308. Do you know whether or not the Home Office has thought of giving exhibitions from time to time of safety appliances which might be proposed for mines?—Yes, the museum was almost completed when the war broke out.

19,309. You are aware that continuously you and others are having sketches and sometimes indeed little plans of suggested safety appliances sent to you, and in many cases I daresay you find they are absolutely useless, but in some cases they might tend to greater safety?—Some of them, yes, and some of these are dealt with by a department set up by the Ministry of Munitions, I have sent one or two on where I thought the invention good and was of a working man who had not the wherewithal to launch

it or introduce it to this department for their information and to deal with.

19,310. If you, as acting chief inspector, had special rules set up to provide for greater safety than you now secure would you consult the mine owner only in the matter?—No. I should consult the actual worker as well as the mine owner. I think you got many very good and very useful suggestions from the miner himself, and my experience is that many of the successful and useful inventions have probably in their origin started with the man who is actually working at the coal face.

19,311. On the question of baths. My colleagues and I all look upon it as a health measure with regard to the firemen and the men. You think if it is made compulsory that the employers must provide washing and drying accommodation it should be made compulsory on the persons employed to use them?—I think so. That was the Home Office opinion when the matter was introduced in the House of Commons. In Committee there was some evidence that all miners in all districts would not agree it should be made compulsory, and the result was the compulsory use was omitted. Mr. Masterman who was in charge of the Bill had to agree to that.

19,312. There are certain things down in the pit which are made compulsory which the men do not like?—Yes.

19,313. There are many sanitary things down the pits which had to be enforced against the whole of the men there?—Yes.

19,314. If made compulsory on the persons to use it, unless they got a doctor's certificate to say they ought not to use it, you allow for that, they would have to use it?—As provided in the regulations at present.

19,315. Do you think you should complicate that by payment by the workmen?—I think it ought to be charged on the industry.

19,315A. The Chairman tells us the probability is that one of the owners of Fletcher Burrows is here.

Chairman: I am calling him next.

19,316. *Mr. Smilie:* Do you think there should be a ballot taken, and two-thirds of the persons employed should vote in favour of it?—I thought I said clearly that compulsory provision and compulsory use at all mines, except small mines, as defined by the Coal Mines Act.

19,317. You do not anticipate the necessity of having to take a ballot at all?—No.

19,318. *Chairman:* I am asked to ask you two questions. With regard to Austrian mines, are they light brown coal?—Yes.

19,319. Are the statistics in respect of mines of that character comparable with mines in this nation?—No.

19,320. The next question is about inspection. Supposing there was nationalisation of the mines, would you say there ought to be an entirely separate department of inspectorship?—I should think the Safety Department should be an entirely, even if there was a Ministry of Mines, separate branch, and it should not be controlled by anyone except the Minister. There is a point I should like to mention if I may draw attention to it?

19,321. *Chairman:* Certainly?—It was mentioned by Dr. Shufflebotham that the Home Office had not taken any interest in the question of nystagmus. That is not true. I should like to say what the Home Office has done. In 1907, the Industrial Diseases Committee reported that the disease was due primarily to fatigue of the elevatory muscles of the eye from the constrained position in an oblique upward direction in which the eyes had to be kept; insufficiency of light appearing to be a secondary but not inconsiderable cause. The Committee's view was the old view entertained before the more recent researches. No reference to this disease was made in the Report of the Royal Commission on Mines in 1909. The growth in the number of cases of nystagmus, as shown by the Workmen's Compensation statistics, drew special attention to the disease. The matter was specially noticed in the Home Office Report on the Workmen's Compensation Statistics for 1912, page 9. The question of inquiry was considered by the

16 May, 1919.]

MR. WILLIAM WALKER.

[Continued.]

Home Office in 1911-1912, but the Royal Society had already arranged for research by Dr. Llewellyn, with the assistance of Dr. Haldane. This research was of a very thorough character; the preliminary Report was issued in 1912 and the Final Report a year later. These researches appeared to establish beyond question the conclusion that the disease was due not to the constrained position in which the miner worked, but to the insufficiency of the light in which he worked. About the same time, under the special powers conferred on the Home Office by the Coal Mines Act, 1911, a standard of illumination was fixed for flame safety lamps, the standard being the maintenance of not less than 3 candle power over a period of 10 hours. Further enquiries are now proceeding—(1) a Departmental Committee has been appointed to enquire into the question of improve-

ment of the illumination of safety lamps, and (2) the information in possession of the National Service Department is being examined both as to nystagmus and generally as to defects and disease of vision in underground workers. That is as far as nystagmus is concerned. As regard other diseases we have used the medical inspectors in the Factory Department freely. Dr. Collis has gone into questions regarding industrial diseases, such as phthisis.

19,322. *Chairman*: We are only on the nystagmus question?—The Home Office has not neglected these matters.

19,323. *Mr. Robert Smillie*: You have a flame safety lamp now that has passed the test which gives a candle power?—Yes.

19,324. One and a half candle power?—This Committee will go into the question of increasing light.

(The Witness withdrew.)

Mr. CLEMENT FLETCHER, Sworn and Examined.

19,325. *Chairman*: Mr. Fletcher, I think you are the general manager and a director of the Atherton Colliery Company?—Yes.

19,326. How long have you been there?—I have only actually been full manager the last two years.

19,327. How long have you been connected with the colliery?—24 years.

19,328. They are Gibfield Pits, Chanters Pits and Victoria Pit, Atherton Colliery?—Yes.

19,329. Are those the three?—Yes.

19,330. You have had shower baths for some time at your colliery?—Yes.

19,331. How long ago were they installed?—They were completed immediately before the war.

19,332. I see the number of people employed at Gibfield is 711, of whom it is said 350 use the baths; Chanters 1,050 workmen, of whom 500 use the baths; Victoria 169, and nearly 150 use the baths?—Yes.

19,333. Is it your experience that you find the baths, when once they are installed, are used by the men?—Yes, that is so.

19,334. I do not say this is the right view, taking it personally. I am going to put to you a curious question. As a business proposition, as a commercial proposition, do you find having baths pays you?—I cannot say there is any direct gain. We always think anything you can do to improve the health or general condition of the workpeople is a distinct gain.

19,335. Has that been your experience at Atherton?—We have tried to work on those lines.

19,336-7. Tell me the sort of effect having this system introduced has produced?—I did not come to give evidence. I have no figures prepared. We are quite satisfied with the results although I must admit a few more of the young men might use them more than they do. We put up accommodation for 1,100 out of 2,200. There are that number using it. They are not overcrowded, yet there are quite a number of young men who you would have thought would have used them. It is found to be beneficial to health and homes. I have no figures to prove that. Another point I should like to mention is, I think it tends to safety. A man comes to the pit, and if he uses the bath he has to change his clothes from the top clothes to the working clothes, and then the matches he used on the way to the pit are left behind in the bathroom. Therefore, there are no matches likely to be taken down the pit. That is a point worthy of notice.

19,338. May I take it, from your experience at Atherton, if you did go where there were no baths, you would make every effort to have baths under your charge at any place you went?—I should certainly like to. If you put in a large installation straightaway without preparation, you would be disappointed. I am told of places where they have been disappointed. To begin with, you want to start in a small way. We put in a few at one pit, put in a few huckets and gradually added and added until we got this little place crowded out and then we put up a larger place. If you were to begin with a large place you will be disappointed.

19,339. *Sir Adam Nimmo*: Did I understand you to say the pit clothes of the men are left at the pit?—Yes.

19,340. They change their clothes at the pit?—Yes, and the clothes are dried there.

19,341. Do I understand there was no demand on the part of the men before you erected these baths?—No, they never asked for them.

19,342. You stimulated the demand?—Yes, I think so.

19,343. You started in a small way and developed and developed and the demand on the part of the men followed your development?—Yes, I think so.

19,344. That was the kind of process that was developed?—Yes.

19,345. How do you manage the baths?—We do it entirely ourselves.

19,346. You give the men no say in the control or administration in any way?—There is very little administration or control required. They seem to manage themselves.

19,347. You do not feel it necessary to establish a committee to deal with the baths?—We have our pit committees, who meet regularly, and any question could come up there in connection with them.

19,348. In the meantime, you keep the management quite separate as far as baths are concerned?—Yes.

19,349. The men have not as yet asked you that there should be some principle of co-operation in connection with the working of the baths?—No.

19,350. You do not think it necessary at your place?—I believe in the main in co-operation. I think it is better to have a joint committee to discuss things. It has not cropped up yet.

19,351. The question has not arisen?—No.

19,352. *Mr. Robert Smillie*: What do you think the women think of the baths, and what do you think the boys think of them? Do you think there would be an outcry among them if you said you were going to stop the baths at the pit?—I think those people who use them or the people at home would be disappointed if there were none. A good many boys who use the baths are living next door to boys who do not bath at the pits, and the parents do not take measures to make them do it.

19,353. Suppose it should be compulsory to use them at every pit where they are provided, if sufficient were provided, that would make it necessary that all should use them?—I should like to make it compulsory for the lads.

19,354. Do you think the lads who do not use them have been brought up from boyhood at your collieries?—Some have, some have not. I know some lads who have nice clean homes that did not use them.

19,355. The men do not take a bath before they go down to work?—No.

19,356. They change their clothes?—They change their clothes. They come in their ordinary daily clothes, their best clothes, if you like to put it so, and they change their clothes at the pit. They put on dry working clothes and they leave their wet working clothes, wet with perspiration, to be dried.

19,357. You said it paid you in the sense of being no financial loss to you? I think you said that you had better attendance than you would otherwise have had at your pits?—I do not remember saying that. I do not see how it stimulated the attendance.

16 May, 1919.]

MR. CLEMENT FLETCHER.

[Continued.]

19,358. I thought you said your average attendance there was less broken because you had a decent class of men coming to the pits because of the baths?—I did not say that, but I think better conditions would produce better workers.

(The Witness withdrew.)

(Adjourned for a short time.)

Captain ROBERT NELSON, Sworn and Examined.

19,361. *Chairman*: Gentlemen, this is the third and last witness from the Home Office on the question we have been discussing this morning. (To the witness.) It will not be necessary for me to go through the whole of your proof, but in deference to the wishes of the Commissioners I propose to direct attention to some of your salient points. You say in your proof: "For more than 10 years I held the appointment of Electrical Inspector of Mines at the Home Office. This appointment gave me an opportunity offered to few outside the coal industry to see its inside working in an important direction, namely, the getting of the coal. I have inspected at one time or another the majority of the pits in the United Kingdom where electricity is used on any considerable scale, and for that reason, I assume, I am invited to speak as to 'Mechanical and Electrical Improvements in Mines.' It is common ground that an extended use of mechanical power is needed to improve the output of coal from most pits. It is also agreed that of the well-established means of transmitting power the most economical and convenient is electricity. I wish in my evidence to support those who have already expressed the view before this Commission that there is a wide field for the extended use of mechanical power below ground in coal mines." Then you set out certain statistics which I need not go into, and then you say: "As to any disadvantage which may follow the extended use of electricity regarded from the important aspect of safety, I have kept a record of accidents arising from the use of electricity below ground during the last 10 years, and this record supplies, I think, a fairly conclusive answer." Then you set out various points and sum it up by saying: "My answer to the question as to whether any disadvantage would follow the extended use of electricity below ground is this: So far as my experience teaches, none, provided the present very moderate standard of achievement as regards safety precautions is maintained. If that standard improves, as one may reasonably hope, then the answer can be given without doubt or hesitation." Summing up the evidence up to the present, it is that there is great scope for the increase of it. Then you say that you do not see any disadvantages, and so far as safety is concerned you think there is no danger?—That is so.

19,362. Then you deal with haulage, and you say: "As to haulage by storage battery locomotives, very few of these are in use in Great Britain, though there is nothing in the conditions in many pits to prevent their use, and I anticipate that this method of haulage will very soon be widely adopted?"—Yes.

19,363. Then you go on to discuss winding by electricity, and you say that very few winding plants have been converted to electricity hitherto?—Yes.

19,364. You say the same as Mr. Merz says: "The general adoption of electricity for winding is, however, dependent upon realisation of the national scheme for electricity?"—Yes.

19,365. Then you say: "Other witness will speak with greater authority as to the advantage of a comprehensive and widespread system of electricity supply?"—Yes.

19,366. Then there is an important sentence which is: "There seems, altogether, to be ample room for some authority charged with the duty of taking a comprehensive view of coal production, which authority should be fully armed with statutory power to remove all barriers to economical working, whether physical or legal, except such as must be retained for safety." There is another very important sentence at the end of your proof which says: "Hence I think that if unification is to be applied to an industry as complex as the coal industry, there

19,369. I think your firm told us that, and not you.

19,360. *Mr. R. W. Cooper*: Have people bathtubs in their own houses?—Very few.

19,367. *Mr. Evan Williams*: In the figures given in the first column, the big drop in the increase per cent. on previous years is due, I take it, entirely to the war?—Yes, it is due to war conditions, I think, entirely.

19,368. Up to that time there had been a progressive increase in the mining industry?—We had no figures previous to 1912, but the increase between 1912 and 1913 of 17·2 per cent. would certainly indicate that. It is also indicated as the result of observation. I know previous to 1912 the use of electricity was being largely extended.

19,369. The Home Office keep a very close control over the introduction of electricity into mines, do they not?—That is so.

19,370. I think no manager has a right to introduce electricity without giving notice and obtaining permission from the Home Office?—Yes; he must give notice to the Inspector of the Division, and the Inspector of the Division has the right to raise objection if he thinks fit to do so.

19,371. And it is only if no objection is raised by the Divisional Inspector that it is introduced?—Yes, but the owner has the right to appeal, which right has never been exercised so far as I know.

19,372. Generally speaking, did you find when you were acting as Inspector that there was a desire on the part of colliery owners to extend the use as much as possible?—Yes, broadly speaking.

19,373. There was no reluctance to avail themselves of the utmost development and improvement in electrical machinery?—No; that is correct as regards some collieries, but I think it would be too sweeping to say that of all collieries.

19,374. I am speaking generally?—It is very difficult to give an answer which is applicable to every colliery, but it is true to say that generally they were willing to adopt facilities if proved to be economical and useful.

19,375. *Mr. Frank Hodges*: With regard to deaths from explosions caused by the use of electricity in gaseous mines, do you think that you can draw any conclusion from such explosions to indicate that you would have to abandon the idea of introducing electricity on a large scale? Take some South Wales mines, for example?—My answer to that question is no. I think that in the very large majority of mines electricity may be used safely anywhere. In some mines it may be that it is necessary to limit its use, but they are relatively few I think.

19,376. I suppose there would be no danger in the mere introduction of electricity, but danger arises from what?—The danger arises from its misuse clearly.

19,377. Or from faulty installation?—Misuse of electricity includes faulty installation, yes.

19,378. Your view is, after considerable experience, that the feeling that the use of electricity in gaseous mines is bad, or at least that it should not be permitted, is not founded upon facts?—Well, not everywhere in the mine. If there is liability to gas and to frequent occurrence of gas, the regulations already provide for the exclusion of electricity, but that would, I think, refer to comparatively few mines, and to comparatively few places in those mines.

19,379. Do you think that electricity for the use of coal-cutting machinery and conveyors in a gaseous mine is a good thing?—Not where gas is liable to occur, I agree.

(The Witness withdrew.)

16 May, 1919.]

THE HON. SIR CHARLES WADE.

[Continued.]

THE HON. SIR CHARLES WADE, Sworn and Examined.

Chairman: The Secretary will read the *précis* of the evidence of the Hon. Sir Charles Wade, K.C., Agent-General for New South Wales.

Secretary:

"Generally speaking, if capitalists can combine to enlarge the scope of their operations, there appears to be no reason in principle why the State should not undertake similar work.

In a young country, such as New South Wales, where it became necessary to open up the interior by means of railways, roads, and other public works, and where private enterprise could not be induced to undertake a scheme in which the prospects of success were very uncertain, the intervention of the State was essential.

In theory it is claimed that such works could be carried out more efficiently by the State for the following reasons:—

(a) The State's organisations and resources are stronger than any combination of private persons, and this should lead to a cheapening of the cost of production.

(b) As the State does not look for profit, the items which the private contractor charges against the risk of failure (and for which he is paid although no loss has been sustained) need not be considered.

(c) Such profit as results to the State should be applied in reducing the charges of transport or consumption rather than in increasing dividends.

(d) State enterprise excludes the middleman, which is a further cause of increased cost to the consumer.

(e) Under wise administration, the wasteful competition of private enterprise is eliminated.

Whilst these may be set down as the advantages of State ownership and control, there are certain other conditions the observance of which is necessary to success. This depends on the efficiency of labour; that in turn depends on an effective method of management and discipline. The greater the pressure that can be brought to bear upon the management, the greater the danger of laxity and inefficiency. If the Franchise is enjoyed by the workers, political influence becomes possible. The nearer the Franchise approaches manhood suffrage, the greater the pressure that can be exerted.

In a disciplined, obedient country, such as Germany, where the Franchise was extremely narrow, good discipline on military methods could, doubtless, be enforced; but the position is very different in democratic countries with voting power approaching adult Franchise.

Authority for Construction.

In New South Wales in the earliest days, the State undertook the cost of railway and tramway construction, but inasmuch as pressure might be exercised by members of Parliament upon Ministers in the choice of routes and principal stations, and as there was a temptation to placate supporters in return for their vote, the danger of "log-rolling" ensued. Some railways, indeed, have been condemned as being unjustifiable on business grounds which have been the result of political pressure.

To meet this danger of abuse, two conditions have been laid down:—

(1) A primary investigation by some authorised public authority on the merits of the proposed work.

(2) In the event of a favourable report by this inspecting body, a further approval by both Houses of Parliament.

As to (1) the opinion is generally held that this investigation should be carried out by experts. But in practice it has been done by a Public Works Committee consisting of members of the two Chambers, yet (although not to the same degree) they are liable to be influenced in the same way as the minister with sole responsibility.

There is the temptation to vote for railways which may help the political party if there is any *prima facie* justification for it on business grounds. At times, indeed, the railway may be approved of which favours a parliamentary minority, so as to facilitate the approval of another which is of more value to the party in power.

There is the same danger of political pressure when the proposals are submitted to the vote of Parliament. In short, these provisions (themselves essential) are a check on political influence, but they fail to entirely eliminate it.

(3) It has been further provided that no work estimated to cost more than £20,000 should be undertaken without prior reference to and approval of the Public Works Committee. This provision has been evaded at times by commencing an operation which in fact will cost less than £20,000, but is really only a portion of a larger scheme exceeding that sum. In this manner the underlying safeguards of Parliament can be destroyed, and the only protection lies in Parliament rising to a sense of its responsibilities; but if the Government attempt this evasion, it is presumably with a knowledge that the party will support them, and the dangers of political enterprise thus become manifest.

State Construction.

Originally the work of construction was carried out by private contractors after calling for tenders, but the system became abused owing to the increase of contractors' "extras." This was owing to the looseness with which specifications were drawn, of which the contractors took advantage; and thus the Government were called upon to pay huge claims outside the contract prices. This difficulty could be obviated by the more careful drawing of the specifications in the first instance or by carrying out the work on fixed schedule rates. The Government of the day, however, adopted an entirely different method and carried out these works by "day labour" under Government control. The success of this system depended on the quality of the supervision, but it was found that men were placed upon the works through political influence, and men who had been discharged were reinstated through political influence; in consequence their discipline failed.

The Government supervisor in charge of the works generally had not a free hand to choose efficient workmen; yet in those few instances in which the controlling authority was allowed discretion with regard to employment and dismissal the cost was brought within reasonable limits. But the principle was established that efficiency of labour was in inverse proportion to political influence. That public works can be carried out satisfactorily on the "day labour" system has been proved in the department of the Railway Commissioners of New South Wales, who are an independent body, and free from pressure of politicians.

Administration.

As in construction, so political interference should be avoided in administration. If strikes take place in Government departments, as a rule a compromise is enforced and a concession made to the strikers. When a strike takes place in the Government department because a workman has been discharged, the Government's position is difficult; if they resist the demands votes are imperilled; if they yield discipline is threatened.

The only safe method of administering a Government department of State is by a Board which is (1) independent of political influence; (2) enjoys a long tenure of office; (3) is paid a salary sufficiently high to attract qualified men.

For many years the State railways of New South Wales were managed by a Commissioner appointed by the Crown holding office at pleasure. Political interference became so serious that the management was placed under a Board of three Commissioners holding office for a period of seven years, and removable only by a joint vote of both Houses of Parliament. This change was very bitterly resisted, but the first

16 May, 1919.]

THE HON. SIR CHARLES WADE.

[Continued.]

Board appointed were firm, and worked an undoubted change in the tone of the service. Much, of course, depends on the character of the individual members, and it is thought that subsequent Boards had not been so successful; but it is generally admitted that if all the dangers of State ownership and administration are not overcome they have been reduced to a minimum on the railways of New South Wales.

The report of the Railway Commissioners of N.S. Wales for the year 1914, the last normal year not affected by the war showed the following figures:—

	£
Gross revenue	7,742,241
Gross working expenses... ..	5,409,820
Nett Revenue	2,332,421
Subtract interest payable	2,123,054
Surplus	209,367

The nett earnings on the tramway capital cost for recent years are as follows:—

1914	3.66 per cent.
1915	4.70 per cent.
1916	4.76 per cent.

I only know one occasion when fares and freights were reduced in consequence of the profits made on the railways and tramways, but I cannot confirm the statement that has been made that fares are as low as a ½d. per mile.

The policy of State construction and control was subsequently extended to the water and sewerage works, of the larger cities. The President of the Board did not enjoy the same independent powers as the Railway Commissioners, but his department was one employing comparatively few workmen, and the temptation for political interference was much less.

The operations of the Water and Sewage Board of State for the year 1915, showed a profit of £96,861, after payment of working expenses and interest on capital stock.

The policy of State control has been further extended to public utilities which may become a monopoly, but hitherto State ownership has not been undertaken. The price of gas in Sydney is controlled by Statute.

In recent years the Government has entered into competition with existing private enterprises and established a number of minor State undertakings. It was argued that as the State is the employer of labour in certain works, it should likewise control the material, such as bricks, cement, sand, timber, pipes.

When the Labour Party came into power in 1910, a number of these undertakings were launched originally under direct ministerial control, and without proper methods. This system, however, was changed and the administration placed under the Public Service Board (to be referred to later on). There was no established ring or combine which these works served to break down, but they certainly employed a large amount of labour at good wages.

Between 1911 and 1917, the following works were established:—Brick works, stone quarries, pipe works, bakery, motor garage, and saw mills, drug depot, metal quarries, clothing factories, timber yard, electric power station, joinery works, lime works, sand and brick works.

A change of Government took place in 1917, when the operations of these works were drastically reviewed. Some had justified themselves—some had completely failed, others were reconstituted and allowed to continue. The position to the end of June, 1918, was as follows:—

Total undertakings established	16
Works then operative	13
Works then inoperative	3

Of the 13 works operating, those showing a profit were 8 and those showing a loss were 5.

The total capital cost of the 16 works was determined by a Committee as £749,909.

Of works still in operation, total nett profits to June 30th, 1918, £18,475.

Total nett losses up to June 30th, 1918, £28,377.

Nett loss on works still operative for the whole period 1911 to 1918, £9,902.

Taking both the operative and the inoperative works together: Total nett profits over the period, £129,846. Total nett losses, £150,463. Deficit, £20,617.

Public Service.

There is a State system of education, primary and secondary. The University of Sydney is largely subsidised by the State, but private schools likewise are established. Public Health is now a Government Department. Ordinary hospitals are controlled and subsidised, but not owned by the State. Mental hospitals are owned and controlled by the State.

The officials of these and other State departments are under the control of the Public Service Board. This Board is supposed to be free of political influence. The members are three, appointed for a term of 7 years, but pressure is exercised strongly in this sphere at times. In 1895 when the first independent Board was appointed, the service had been over-manned, and political influence was certainly active.

The first duty of the Board was to retrench and reorganise the departments. The work was most unpopular. It was carried out conscientiously, but no Government would have faced the ordeal themselves.

Opportunities still present themselves for evading the Independent Control by the Board. Under the law, temporary appointments for a period of six months may be made by a Minister, but members of the service were in this way increased so much, that at election time a demand was made that temporary appointments should be placed on a permanent basis, with all privileges. On the whole, the bulk of the service prefer the independent Board to the old days of Ministerial influence.

Recently an enquiry has been held into the workings of the Public Service, which have resulted in the Board being reconstituted, and the new Tribunal are to enjoy a life tenure and at a much larger salary than their predecessors.

Coal.

The nationalisation of coal is a leading plank on the platform of the Political Labour Party, but demands for nationalisation, although frequently made, have never yet been conceded.

The Labour Government, in power from the end of 1910 to 1916 were pledged to nationalising the coal industry, yet, although they established the minor undertakings referred to above, and even under pressure sanctioned a State coal mine for the use of the railways, they have never attempted to nationalise coal mining. It may be added that when it was announced that the State coal mines should be under the control of the Independent Board of Railway Commissioners the demand was not so strongly pressed. The miners as a body still demand nationalisation of coal. It is known that a "day labour" system is strongly favoured in preference to contracts, and it may be that they hope to obtain the concession of day labour under Government control, which at present the coal owners decline to grant.

Wages and Conditions of Labour on Coal Mining.

For many years wages, &c., were settled by mutual agreement between the parties, but since the year 1903, an Arbitration Court for the compulsory fixing of wages has been established throughout the State. These Courts, which were intended to reduce strikes to a minimum, however, have never been popular with the miners, and strikes, unfortunately, still prevail. The wages, however, and other conditions compare extremely favourably with other institutions. The wage to-day is about for coal hewers, and it is reported they are to receive a further increase of 3s. a day.

At one time many of the coal mines worked three shifts, but the night shift is not worked in New South Wales to-day, and some mines have even agreed to abolish the second shift. The hours of work are 8½ for minors, roughly speaking, bank to bank.

16 May, 1919.]

THE HON. SIR CHARLES WADE

[Continued.]

Accidents.

There is a common law as well as a statutory duty on the coal owners to provide for the safety of the workmen, and owing to the special dangers attached to coal mining, such as gas explosions, falls of roof, and tram accidents, Parliament have imposed special conditions in the interest of the workers. There is a compulsory inspection of every working place during each shift before the men go to work. The presence of gas, the condition of the roof and ventilation are recorded in a book, which is open to inspection at any time. In case of any defect indicating danger, the working place must be shut off, and no workman can enter until the danger is removed, and there is a penalty for neglect of this duty.

Further, Government Inspectors enter the mine without notice whenever they think fit. The miners may elect a check inspector to point out defects to the Government Inspector, as well as to the owners. The Government Inspector can demand the establishment of safety appliances; if the owner resists the issue is sent to arbitration, and he must obey the award, with a penalty for disobedience. If neglect to supply safety appliances is wilful and injury ensues, the penalty imposed may be so heavy that it is not cheap to compensate than take precautions.

All accidents about the mine must be reported forthwith; an investigation is held by Government officials, and in certain cases a special tribunal may be appointed by the Government to investigate the cause of the occurrence. In case of death the usual inquest is also held. In addition to these precautions the employment of boys under 14 is prohibited, and the employment of women and girls in or about the mine is also prohibited.

Although the mines in New South Wales cannot be called gassy, safety lamps have been introduced by the owners, although opposed by the miners. Coal cutting machinery was likewise introduced, although in many cases opposed by the miners.

The statistics of accidents in coal mines are as follows:—

Year	No. employed metalliferous.	Coal and shale.	Total.	No. of deaths.	Per cent. deaths total employed.
1913	19,914	18,966	38,880	618	1.59 per cent.
1914	17,493	19,977	37,470	588	1.57 "
1915	13,190	18,221	31,411	560	1.78 "

Year.	Employed in coal and shale mines.	Fatalities.	Fatalities per cent.	Seriously injured.	Seriously injured percent
1913	18,966	18	.095 per cent.	74	.4 per cent.
1914	19,977	17	.085 "	73	.36 "
1915	18,221	23	.126 "	49	.27 "

Special regulations have been framed to meet the cases of miner's phthisis and ankylostomiasis.

It should be added that as a rule the coal mines in New South Wales are free from gas, the seams are high and the roof is sound, yet it has been proved that although it is impossible to prevent all accidents, under Government supervision and private ownership they have been reduced to a minimum.

Housing.

With every respect I doubt if bad housing in England is the result of private enterprise rather than a concomitant. Probably the same conditions as we have here would have resulted had the coal mines been State owned. I say so for this reason: Until lately housing has been no part of the State policy. When it has been advocated, then the advocacy has been limited to congested areas in the large cities. Moreover, until lately the miners have made no organised complaint. I know of no instance where bad housing has been the occasion of a strike or even of an arbitration, yet the mining community has enormously increased in numbers. If there is blame

for the present situation, it should be shared by all parties—by the State and the owners for failing to anticipate these abuses; by the miners for not showing more activity in demanding healthy conditions and healthy homes for themselves and their young children.

Owing to the cessation of building operations during the war, the house scarcity has been created, and the public mind has, for the first time, been actively turned in that direction. The remedy, however, in my opinion is clearly a State duty, and housing should be carried out as part of the work of the Department of Public Health. A scheme should be laid down for the whole of the community, and it might be desirable for local bodies to undertake the work.

In New South Wales, on the whole, housing conditions are good, but there are many bad cases. One cause for poor conditions has been the practice of allowing miners to erect dwellings close to the mine on the freehold surface, but with only a permissive occupation—the result being that in the event of a strike the owner can eject the miner without legal difficulties; yet, on the other hand, the miner with no security of tenure had no inducement to build a decent house. This, however, has been to a large extent remedied recently.

Waste.

The coal owners have been accused of wasting their opportunities of making use of the by-products of coal. If there is blame, it is the fault of the national policy rather than individual action. The profit-making coal owner naturally avoids undertakings where there is no market for his products. We have a standing example of the country's reliance on aniline dyes from Germany. In New South Wales for many years the "pit smalls" were allowed to accumulate until they assumed the dimension of high hills, but in recent years coke has become a marketable commodity, and every coal mine now has its row of coke ovens, and all the coal produced is utilised, whether large or small.

Broken Time.

There is much broken time in New South Wales. It may be traceable to the following causes:—

- (1) Irregularity of the export trade which is dependent upon shipping.
- (2) The loading of steamers at times in open roadsteads where loading is dependent upon the conditions of the weather.
- (3) Continual petty strikes which dislocate the whole mine.
- (4) The irregularity of miners returning to work after pay Saturdays.
- (5) Extensive competition amongst the owners in "cutting prices"—this results in the weaker collieries lying idle and causes general depression in the selling prices for the district.

This was very marked in New South Wales.

A system known as "Coal Vend" was established, the principle being the same with variations in different districts whereby all the owners agreed to sell the coal at a certain fixed price—one common agent would receive all orders for that district and the work would be distributed equally amongst the various bodies, so as to divide any shortage of payment amongst the total body of miners. Somebody, however, in the alleged interest of the miners challenged the Vend as being an attempt to create a monopoly. The High Court of Australia upheld the validity of the agreement, but the owners discontinued the arrangement.

I suggest for consideration as a remedy for broken time that just as prudent company directors will out of the profits of a good year establish a reserve fund for the equalisation of dividends in bad times, so out of the profits of a coal mine a reserve fund might be formed to be used for the equalisation of wages in times of depression, or to assist those who are compelled to be thrown out of work. Such a fund would give men an interest in their work, a stimulus even to better work and a closer sympathy with the proprietors. Such money should be allocated irrespective of any increased wage accruing in good times.

16 May, 1919.]

THE HON. SIR CHARLES WADE.

[Continued.]

Moreover, the burden should be thrown upon the industry and not upon the community.

It has been suggested that to avoid broken time coal might be stored without deterioration. I know that large stocks of coal are held for months by the Railway Commissioners in New South Wales without serious deterioration; but it is generally known that strikes take place when coal stocks are low, and I am not sure whether this policy of storing coal would be welcomed by those endeavouring to engineer strikes.

State Ownership does not stop Strikes.

The answer of universal experience is "No." In Victoria the State coal mines have struck work on several occasions. In New South Wales the Government railways and tramway workers, who enjoy, perhaps, the most liberal conditions of anyone in the world, have struck, although it is fair to say that a large number, in spite of temptation, remained loyal to the Government.

The Commonwealth ship-building yards in Sydney and Melbourne have been the scene of strikes on many occasions. The workers on the Trans-Continental Railway have struck, and the State coal mines in New Zealand cannot claim to be free of strikes.

Effects of Ministerial Control.

If the workers are united in large numbers and enjoy the franchise their influence can be immediately felt.

The Minister who refuses a joint demand may imperil the popularity of the Government. If several organisations of State employees unite to present a common demand, the danger is intensified. Statesmen do not seem to have yet imbibed sufficiently the sense of public service to be able to withstand such demands at the risk of losing office.

Experience shows there is no stimulus to economy or to reduce excessive staffs; for the prevailing feeling is that it is Government money that is being spent, and the tax-payer will pay. Our experience of the present war confirms this. Clerks in a private concern must help to make it pay, and exercise economy whenever necessary or face the alternative of being discharged. State ownership encourages bureaucracy in the desire to avoid responsibility. Nationalisation is most injurious to the miners themselves. The policy of the Trade Union, very praiseworthy in itself is to help the workman who, through competition, is out-classed by the superior man. To help him under the system of private ownership, the output of the better workman must be reduced and consequently his wages must be limited. This practice is accomplished in two ways:—(1) By substituting a fixed daily wage for payment for contract, or piece work; (2) A man is allowed so many skips or tubs per week or some other fixed period by the Workers' secret Committee of the Mine. The owners of course resist this strongly. The idea prevalent amongst the miners is that if the State became the owner and the miners enjoyed the necessary voting power, the State could be induced to introduce the system of a daily wage or at all events be less strenuous in insisting on a full output of labour. This certainly is the tendency in many quarters and if really effective, the incentive to hard work will be destroyed—the occupation of the man will be stifled and laziness encouraged.

Outside the general administrative staff, the miners initiative and research can still be maintained through the medium of a bureau, so long as the Government offer sufficient inducement in the form of adequate salaries.

Threatened Monopolies.

Can prices be fixed by Government control whilst ownership of the commodity remains in private hands or must the State become the owner? If the product can be put to a variety of uses, and be equally profitable, and the price of the article for one purpose is unduly limited the product will be diverted to another channel and so long as the producer has such freedom he will be able to evade the fixing of prices.

This applies generally to all forms of production.

For instance, cattle can be held back from the market, or the meat may be canned or sold fresh to the butcher.

The farmer may convert his cream into butter or cheese.

The agriculturist may sell his wheat for flour or convert into fodder for cattle.

New South Wales had a unique experience at the outset of the war. Owing to a dry period the price of butter had risen and the Government fixed a maximum price. The farmers forthwith sold their stock to the butcher at substantial profits, and in a short time a butter famine ensued. Similarly a maximum price was fixed for wheat, and the farmer promptly turned his crops into hay, which resulted in a reduced harvest and a great scarcity of flour. If prices are to be officially controlled the producer must be under the direct orders of the State. Consequently the ownership of industry by the State becomes necessary.

Coal, however, does not present these difficulties. The output must be sold or not sold. Further, the ordinary competition amongst owners is a guarantee against combines. If, then, to guard against cut-throat competition a Board is set up to stabilise prices, the utmost needed to prevent possible exploitation of the public would be the fixing of a maximum selling price whilst leaving the ownership in the individual proprietor.

Conclusions.

1. In a young country without private capital the State must step in to construct public works.

2. Being the owners of such works the State may logically control their operation.

3. In either case the State can successfully intervene only if the control is directly undertaken by an independent Board entirely free from political influence, although eventually answerable to Parliament.

4. Where the public utility under private enterprise becomes a monopoly, and it is necessary to control prices, the State may assume ownership; for it is impossible to fix prices against the will of a private owner and still ensure his continuing to produce, whereas, if the producer is a State employee he must obey orders.

5. In the coal industry with its variety of seams and districts and qualities of coal, there is always sufficient internal competition to obviate exploitation of the public up to the time the coal leaves the pit mouth.

6. Boards for districts with Government representation should be chosen to stabilize prices, prevent cut-throat competition and the consequent depression of prices.

7. Wages should rise and fall with the selling price of coal on a fixed ratio.

8. All coal for sale after leaving the pit mouth should be controlled; and this can be accomplished without nationalisation of the coal industry as a whole.

9. Government machinery should be established for (1) fixing wages and conditions of labour, (2) affording protection against the special dangers incidental to the industry, (3) safeguarding public health, including in this the question of housing.

10. Miners should have representation on the Tribunal for fixing wages and conditions of labour, but it would be dangerous to discipline if they shared in the management of the mine.

11. A Bureau of Research should be established to investigate improved methods to mining and safety appliances."

19,380. *Sir Adam Nimmo:* Are there any State-owned mines in New South Wales?—The nearest approach to it is the mine that is partly sunk for the use of the Railway Commissioners. I refer to that in my evidence, and I have heard in the last few days that they have got as far as sinking the downcast shaft, completing that, and they had got part of the way with the upcast, but the Government have given instructions to cease it, and nothing has been done.

19,381. But no coal has been as yet worked?—No.

16 May, 1919.]

THE HON. SIR CHARLES WADE.

[Continued.]

19,382. I think that the burden of the first part of your evidence with regard to State-owned and State-controlled organisations is the difficulty that arises through political pressure?—That is the crux of the whole position, in my opinion. The mere you can divorce State-controlled operations from political influence, the nearer you will approach satisfaction. It is in the inverse ratio: the more it creeps in, the more difficulty.

19,383. Do you see how you can bring about that divorce?—We get pretty close to it in connection with the railway and tramway system in New South Wales, but it is a constant cause of political controversy.

19,384. From the point of view of the workmen of these institutions, do you find that they exercise their political influence to as full an extent as possible?—Do you mean their political rights as voters?

19,385. Yes?—They are not in the least degree trammelled: they have perfect rights.

19,386. Do they not use the political rights that they have to bring their views to bear on the State organisation?—Yes, with a board thoroughly independent, the power of political pressure is shut out.

19,387. That is to say, you have always to get the length of an autocracy in management in order to get that result?—That is what it comes to: the nearer you approach the autocracy, the greater the complaint that you are removing the whole system from parliamentary responsibility.

19,388. Is it your feeling that, unless you secure what I have called autocracy of management, your system of State control or management breaks down?—I would not go so far as to say autocracy, because this board is still amenable to Parliament. They are not autocrats.

19,389. I notice that they are appointed for a long term period?—Yes, and are only removable by the resolution of both Houses.

19,390. They are also paid high salaries so as to make them, as far as possible, independent?—Yes.

19,391. And in order to attract the best men that can be got?—Yes.

19,392. Is it your view that experience has shown that some such system as that is necessary where you have State-owned and State-controlled organisations?—There is no question of that. They introduced it into the railways on account of the failure of the old system of control.

19,393. Then it is not your view that labour is more efficient under State ownership and control than under private ownership?—Some of the workers in the Government railway service are some of the best in the world, but it just depends on one factor—that vital factor—how far the indifferent man or the inefficient man hopes to rely on influence to improve his shortcomings.

19,394. Leaving now the question of the official for the moment, what about the workman in respect of efficiency under State ownership and administration: is it your view that he works more efficiently or less efficiently under State ownership and control?—The Government railways is the best test, and I think on the whole I may say that the work has been efficient.

19,395. We sometimes hear in this country that in the colonies there is a "workman's stroke" in a Government concern: it is assumed to be a slower stroke than the ordinary man gives. Is that known in New South Wales?—Yes, I have heard of it, but it is not confined to New South Wales.

19,396. What is the tendency in respect to wages: are the wages in those institutions higher than they are in organisations controlled by private enterprise?—There may be a slight advantage to the Government servant, taking such works as the railway works, not much over ordinary trade and industry; but they get an advantage in the number of privileges which the ordinary man under private control does not get; for instance, there are three

weeks' holiday in the year; then they get an elaborate pension fund, 1½ per cent. on their wages, and a very handsome pension after 30 years' service, or less than that if they are injured and compelled to retire.

19,397. I suppose that refers to the higher officials, does it not?—It refers to everybody.

19,398. Is it your view that in respect of wages in Government-owned institutions, there is less pressure brought to bear to secure higher wages than in connection with private enterprise?—Under the machinery we now enjoy there is no need for pressure at all, because there are Courts established to deal with questions of labour and hours and working conditions of industry in every trade, whether Government or private control. If a man has a grievance he has only to ask for the case to be put before the Board, and the Board will proceed with it, if it is a reasonable one.

19,399. Do these men in Government-controlled industries formulate and put forward fewer demands?—No.

19,400. Do they try to secure the best conditions for themselves?—I think everyone is trying to better himself.

Mr. Herbert Smith: Can we have a definition of "fewer demands"?

19,401. *Sir Adam Nimmo:* Loss. The point I want to get at there is this: that it is suggested that when a workman works for the State he works in a different spirit than he does for a private employer. Do you share that view?—It first of all depends on the man. Some men get a peculiar sense of responsibility, and they will do their day's work, never mind who their employer is; but there is a certain section, and no doubt the tendency is encouraged in some quarters, who go slow in a Government department where such a pace would lead to dismissal in private employment.

19,402. We have to look at these questions on a broad basis of averages?—Yes.

19,403. What would you say, looking at such a problem on the basis of a general average: do you think the men are more content or less content under State ownership and control?—I do not think there is any marked difference. There is no doubt the men like to get, especially, into the Government railway service on account of the advantages: the pay is slightly in excess, and there are numerous privileges that do not attach to ordinary employment. There is no doubt that those privileges have a very useful effect in troublous times, in keeping the men loyal to the Government.

19,404. With regard to financial results, I think you make it quite clear that these results have on the whole been satisfactory where institutions are controlled or owned by the State, as far as New South Wales is concerned?—No, I could not say that. I think the figures for the New South Wales railways of last year, which I took as the last normal year, because the conditions since the war have been slightly different, the last normal year, 1914, showed a surplus of £209,000 after paying all expenses and interest upon capital; but I say at once, when you depart from strict business and independent control, there is always a danger, and it is sometimes shown in reality, of the profits disappearing, as you will see in the State works undertaken, which after 7 years' operation as a whole to-day show a deficit of £20,000.

19,405. Apart from the railways, I think that you refer to a number of other undertakings where the financial results have not been satisfactory?—The water and sewage works, which is much more free from political pressure than the railways, show a profit, but the great undertakings which I mentioned just now, the brickworks, stone quarries, pipe works, and so on—those undertaken some six or seven years ago were part of the Government policy—there was no combination or trust to break down, and as a result the price they sold at was within a very small figure of the market price of the private industry, and apparently the private people could still go on to make their profits, but the net result to the Govern-

16 May, 1919.]

THE HON. SIR CHARLES WADE.

[Continued.]

ment has been, over a series of years, this deficit of £20,000.

19,406. So that when they come to deal with ordinary industrial undertakings, it cannot be said that they are successful?—Those are the figures. That is the experience.

19,407. With regard to these financial results, would you say that it is due to the withdrawal of initiative and enterprise, want of stimulus behind the whole machine?—There has been no independent control of these 16 works that I have just referred to. They are under Ministerial control, and there has been an effort to introduce political pressure from time to time. There is no doubt about that, and one or two of these works have been very successful; for instance, the brickworks have, from the very inception.

19,408. I think from your *précis* one would gather that under Government ownership and control there is what one would call a certain amount of indifference as to the cost?—I think so.

19,409. That gradually creeps in?—It gradually grows; there is the universal feeling with regard to the Government that we need not pay our Income Tax; the Government is a milch cow, and so it is with regard to public works; it is thought the taxpayer will pay, and there is no further punishment comes on to our heads for extravagance; and so it goes on.

Sir Adam Nimmo: Sir, I want to ask one or two questions later with regard to New South Wales, with regard to the railways.

Chairman: Very well.

19,410. *Sir Adam Nimmo:* I notice you suggest on page 3 that you think out of the profits of a coal mine a reserve fund might be formed for the equalisation of wages in times of depression or to assist those who are compelled to be thrown out of work. Does that not imply that the collieries are working on what could only be called a very large profit?—I do not pretend to express any view with regard to the figures.

19,411. If you found that the collieries of the country were working, let us say for the sake of argument, on the basis of a gross return of 9 per cent., would you think this principle could be applied to the case of these collieries?—I am rather inclined to think this, if I may say so—it may seem to be presumptuous—but, in view of the change in the attitude of the industrial world within the last few years, it might well be the policy in the future for all directors, in their own interests, to guard against intermittent unemployment and consequent distress and the possible growth of class feeling and class prejudice.

19,412. But I take it you are not thinking of going further, are you, than this, that as much as possible should be done for the workmen in improving all their conditions consistent with the reasonable economic potentiality of the industry?—Yes, you have to consider the industry. You have to pay your workmen in the first instance. You have to pay, if you can, dividends to those who put their money into it; and having taken those preliminary essential steps, then my idea was to make some provision or reserve fund for dividends and workers as well.

19,413. I suppose it would be necessary to provide sufficient money to keep the industry progressive?—Yes.

19,414. Would you agree that that is a very essential factor in the situation?—I think so. I think money for the purpose of exploration is absolutely essential. There is one object on which I think money is spent freely by private enterprise which would not be spent by the State. We have a very remarkable case with regard to coal in New South Wales. There is a very large and extensive seam of coal underlying the City of Sydney, and some 20 years ago the Government put a bore down on the north side of Port Jackson and struck a seam of coal 5 ft. in thickness of nearly 2,000 ft. in the residential area, but nothing was done. A company was then formed later on to try and tap this seam on the south side. They had

a very large capital, and they spent the whole of it in sinking the up shaft on to the coal. They then found the coal was split into two narrow seams; and a new company was formed, which also was exhausted in the effort; and a third company came on the scene, benefiting by the work done before. They finally struck a 6 ft. seam clear of bands; and it is now a profitable concern, on the very water's edge.

19,415. The State did nothing?—I cannot fancy that the State would make those three efforts.

19,416. *Mr. Sidney Webb:* The State actually put the bore down?—In a different place, and there they stopped.

19,417. *Sir Adam Nimmo:* When they put the bore down they discovered this good seam of coal, and did not do anything further?—That may have been on account of the position in a residential area.

19,418. I see that you say under the heading of "Conclusions" that all coal after leaving the pit mouth should be controlled. What have you in your mind in making that suggestion?—That should be limited to the present position.

19,419. You mean that the distribution throughout the country should be controlled?—The difference between the selling price at the pit mouth to-day, or recently, and the selling price to the consumer to my mind shows that there should be some control to bring that margin down.

19,420. Have you in your mind as to how you could bring that about? Would you do it through municipalities?—It might be done by some inquiry—deciding what the cost of distribution is on reasonable lines, and laying down some maximum figure beyond which it should not be sold retail.

19,421. But your view is that, consistent with the position, you would keep the collieries entirely free?—The working collieries, yes—and the distribution only if the selling price to the consumer is proved to be excessive.

19,422. *Sir L. Chiozza Money:* Do you mind telling me whether you are uttering your own personal opinions here to-day or whether you are speaking for the Government of New South Wales?—Entirely personal—in no way binding the Government.

19,423. May I ask how long it is since you were in Australia?—Two years ago.

19,424. Do you know Mr. Trivett, the Official Statistician in New South Wales?—Yes.

19,425. If he writes a thing in his Official Year Book would it be correct?—I should like to hear what it is first.

19,426. Is he a credible person?—Yes, generally.

19,427. You make a statement on page 2 of your *précis*, which struck me rather, as it happens to be something quite contrary to what I have myself told this Commission. You say: "I only know one occasion when fares and freights were reduced in consequence of the profits made on the railways and tramways"?—Yes; that is in 1910.

19,428. Mr. Trivett says on page 335 of the Official Year Book for New South Wales, published in 1917: "The Railways being owned by the State, public opinion at once demands a reduction in freights and rates when net earnings are much in excess of the interest requirements. Substantial reductions were made in 1911 and 1912, but season ticket holders and certain goods rates were increased as from 1st July, 1913, in anticipation of an increase in working expenses, and further increases were made on the 1st March, 1914." Is that correct?—That is one decrease he speaks of.

19,429. No, two substantial reductions for 1911 and 1912; and further he says that public opinion always demands it?—No doubt about that. It is a question whether that is the financial year 1911-12 or two separate calendar years. 1911 I know about.

19,430. Substantial reductions, he says, were made in 1911 and 1912?—That is two cases.

19,431. Then you go on to say: "I cannot confirm the statement that has been made that fares are as low as a halfpenny a mile"?—Yes.

16 May, 1919.]

THE HON. SIR CHARLES WADE.

[Continued.]

19,432. He gives a list of the fares—these are the increased fares from 1914—and he shows the second-class suburban fare, 20 miles is 11d.; that is as nearly as possible a halfpenny a mile?—Does he say where that is to?

19,433. He simply says suburban fares. This is New South Wales?—I have taken the trouble to work those things out myself from one of the last time-tables available, and the rates are for suburban areas up to 20 miles, 1d. a mile first-class, and for the second-class varying from $\frac{3}{4}$ up to $\frac{5}{8}$, 61-78ths, 75-81ths—slightly in excess of a halfpenny.

19,434. This is the Government Statistician of New South Wales?—I am quoting from the Government time-table.

19,435. He also gives the workmen's weekly tickets, and he shows that for 10 miles a return weekly second-class ticket is only 2s. 6d.; that is four miles for a penny?—The workmen's tickets are quite different.

19,436. The statement appears to be confirmed by the Government Statistician?—I take that to refer to ordinary passengers.

19,437. I only point out that the Government estimate is somewhat at variance with yours?—I will stand by mine.

Sir L. Chiozza Money: The witness's evidence is being put in, and it is said to be the evidence of the Agent General for New South Wales. That, at once, gives the suggestion that this is representative evidence. This is the Official Year Book for New South Wales, and on this point it gives these facts, which, I say, are at variance with this evidence which is being put in, no doubt, in quite good faith.

Chairman: As I understand, Sir Charles, after all, is bound to say what he is. He is the Agent General for New South Wales; there is no doubt about that, and it cannot be controverted. He then says he is expressing his personal opinion and not the views of the Government. That is how it stands. The witness is perfectly right, if I may say so.

19,438. *Sir Leo Chiozza Money*: With regard to the miners in New South Wales, was there a miners' strike when your Government was in power?—There were two when I was in office.

19,439. Was the strike broken?—What does "broken" mean?

19,440. Was it a failure? Were very strong measures taken by your Government against the strikers?—The strike in 1908 was settled. The miners were told that if they would return to work the Government would appoint a tribunal to investigate their grievance without delay. They went back to work, and the tribunal was appointed. There was a much larger and longer-sustained strike in 1908 or early in 1910, which lasted for ten or eleven weeks, I think. In that case the miners declined to accept either a Board or Royal Commission, and stood out, and eventually the Government took steps, under the Arbitration Act, to prosecute the delegate board or ringleaders. They were convicted, and shortly after that the strike did come to an end.

19,441. Did some of them find their way into prison?—Yes.

19,442. *Sir Adam Nimmo*: I want to ask one or two questions about New South Wales. I asked a question of you with regard to the effect of the management of the railways by the Commissioner that were appointed, and I think you said that their work had been efficient?—The Commissioners' work.

19,443. Is that the general view that is held in Australia and New South Wales with regard to their work?—I think so, in so far as that the people would not return to the old system.

19,444. Was there not a very considerable outcry against their management some time ago in the public press?—Yes.

Chairman: The public press of New South Wales.

Sir Adam Nimmo: Yes.

Chairman: We cannot go into that.

19,445. *Mr. R. H. Tawney*: You do not say anything in your paper about the ownership of minerals: could you tell us about the law in New South Wales?—Gold has always been reserved to the Crown without grant, of course; coal has gone with the land. I am not quite sure of the present position with regard to coal, but all other metals, everything else since the year 1909, is reserved.

19,446. That is to say, the present position of the law is that minerals are not private property since 1909?—I am not sure about coal. I say all grants since then have reserved metals.

19,447. You are not sure about coal?—I am not quite sure.

19,448. Could you find out for us? Has the question been discussed in your State at all?—Yes, I think that the change in the condition of grants was the outcome of public discussion.

19,449. Have you any experience or views one way or the other?—I think it is desirable in these days to adopt a uniform policy for the future and reserve all minerals for the Crown.

19,450. You think in the future all minerals should be reserved to the Crown?—Yes.

19,451. *Chairman*: I have been asked to ask you two questions. First of all, what office did you hold during the strike? Were you in office then?—I was Premier.

19,452. The only other question I want to ask you is this. If you would be kind enough to look at your Conclusion number three: "In either case the State can successfully intervene only if the control is directly undertaken by an independent Board entirely free from political influence, although eventually answerable to Parliament." *Sir Adam Nimmo* asked you some very important questions on that, but I want to supplement these questions. Have you anything to say with regard to the composition of the independent Board? Let me suggest to you the sort of thing I mean. On that independent Board would there be found representatives of (a) the miners, (b) the consumers, and (c) the management or managers of the various collieries? How was the independent Board composed?—I think representation of all interests affected would be helpful; but certainly you want somebody on the Board who is a man of business too.

19,453. Finally with regard to the railways that *Sir Adam Nimmo* was asking you about do you wish to say anything with regard to that?—I have nothing more to say.

19,454. I am very much obliged to you for the assistance you have given us?—May I give the figures with regard to the coal wages?

19,455. Yes, the figures which were left out?—I got these from the Government of New South Wales in the last few days. The wages for miners and coal getters until recently in 1918 worked out at a minimum of 10s. 11d. per shift, but individual miners made from 15s. to 25s. per shift. The coal prices, large and small combined, for the Northern district f.o.b. was 13s. 8d. per ton; the Southern district 13s. The average value at pit's mouth for the whole of the 1918 output was 10s. 11d. per ton. The Commonwealth has recently proposed an increase of 2s. 9d. in the Northern field, 2s. 6d. in the Southern, 2s. 6d. in the West, following upon an increase in miners' wages of 23½ per cent. for shift miners, and 15 per cent. for contract miners. That is the position to-day.

19,456. *Mr. Herbert Smith*: When you say "miners" do you include all the coal getters or all in the pit?—The coal getters' wages were 10s. 11d. per shift.

(The Witness withdrew.)

Chairman: I have now to interpose, with your consent, a witness rather out of his order on the export trade part of the case. He has been sent to

France and may not be back here in time. He is one of the witnesses who speaks with regard to Monmouthshire and South Wales export trade.

16 May, 1919.]

Mr. THOMAS JOSEPH CALLAGHAN.

[Continued.]

Mr. THOMAS JOSEPH CALLAGHAN, sworn and examined.

Chairman: With your permission, gentlemen, I will ask Mr. Evan Williams to cross-examine, he is our South Wales expert, and Mr. Frank Hodges, who is South Wales also.

Thomas Joseph Callaghan will state:—

1. He is President of Cardiff Chamber of Commerce and Chairman of South Wales Coal Exporters' Association, Chairman of L. Guerot, Limited, and other Exporting Firms, and Vice-Chairman of the Central Executive Committee for the supply of Coal to France and Italy.

2. Witness is giving evidence on behalf of a Joint Committee of the Chambers of Commerce of Cardiff, Swansea, and Newport, appointed at a Meeting held in the Council Chamber of Cardiff Chamber of Commerce on Monday, the 3rd March, 1919, and represents the Coal Exporters of the whole of South Wales and Monmouthshire.

3. Witness has himself been engaged in the Foreign Coal Export Trade of South Wales for the whole of his life, and is thoroughly familiar with the business in all its branches.

4. The prosperity of South Wales and Monmouthshire is almost entirely dependent upon the Export Trade in Coal. The principal industries apart from the Coal Trade are the Railways and Docks, the Ship Repairing and Patent Fuel Industries, and the Iron and Steel and Tinplate Trades, but of these Cardiff itself is almost completely a one trade port, and employment depends practically entirely upon the Coal Trade and its complements in the shape of Railways and Wet and Dry Docks, so that any increase of price which affects the output of coal reacts prejudicially upon employment throughout the whole district, affecting Railwaymen, Tippers, Trimmers, Ship Repairers, Patent Fuel Workers, Shippers, Seamen, Dockers, Dock Labourers, and many others.

To show the importance of these trades to the Port of Cardiff (Bute, Penarth, and Barry), witness will put in a statement (Table A) showing the relative figures of Export and Inland Coal Traffic on the three local Railways, i.e., Taff Vale, Rhymney, and Barry Railways, for the 3 years prior to the War, which shows that the percentages were as follows:—

	Per cent.	Per cent.
Taff Vale Railway ... Shipments	93½	Inland 6½
Rhymney Railway ... Shipments	79	Inland 21
Barry Railway... ... Shipments	98	Inland 2

In considering these figures it must be remembered that the Taff Vale carries nearly as much total coal on its 123 miles as either the Great Western, Midland, and L. & N.W. Railways with nearly 2,000 miles of line.

5. For the ten years ending 31st December, 1913, Witness will give the total output of coal from the South Wales and Monmouthshire Coalfield and the quantities shipped. (Table "B.")

6. He will also name the principal markets to which the Foreign Exports were sent from 1906 to 1913. (Table "C.")

During the past 20 years there has been a contraction of the area of the foreign market for Welsh coal to a shorter range, and practically by the year 1913 the principal markets were Franco, Italy, the Argentine, Brazil, and the Mediterranean.

The reason for the contraction of the range of markets was the competition of the German, American, Japanese, Australian, South African, and Indian coal. Competition in normal times is so keen that Witness has often lost or secured valuable contracts for a difference of 2d. per ton.

7. Witness desires to emphasise the fact that the supremacy of Welsh coal is not to-day so complete as it was in the past.

In the future Witness fears that we shall have to encounter much more serious competition from America. The Americans have now, largely owing to the diversion of our coal to France and Italy during the war, got an entry into different markets, especially South America, and it will be difficult to dislodge them. During the war the output of coal

from America has increased by 115,000,000 tons, and our output has decreased by 60,000,000 tons.

Formerly Witness did not much fear American competition, as in this country we always held a great advantage over America by reason of our superiority in tonnage. Now, however, things are different. The Americans have and are building a large mercantile fleet, and if this is maintained, as seems at least likely, our tonnage superiority, and therefore our capacity to meet their competition, is seriously endangered.

According to Lloyds Register Shipbuilding Returns the tonnage under construction on March 31st, 1919, throughout the world was 7,796,266 tons, of which the United States are building 4,185,523 tons.

Already we are hearing of C.I.F. offers not only in South America but in different European countries at low prices.

8. Witness will emphasise the effect on the Tramp Shipping Trade of a reduction of output of 10 per cent., or roughly based on 1913 figures of 3,000,000 for South Wales and 28,000,000 for the U.K.

This loss of bulk cargo to our shipowning trade will entail an increase in the homeward freights for food and raw materials. A tramp steamer calculates her revenue and expenses on the round voyage out and home, and if, owing to lack of markets and therefore employment for her, she cannot get an outward freight or has to take an economically low outward freight, she has to make it up by the homeward freights being increased.

9. Witness desires to explain shortly the functions of the exporter:—

(a) It is the duty and interest of the exporter by means of houses abroad, foreign agencies, travellers, and correspondents to keep in the closest touch with the requirements of the consumers in the different foreign countries.

(b) To ascertain the periods of the year, the quantities and the qualities and mixtures of the coals which are required by the consumers in different countries.

On this head experience shows that the class of coal which is suitable for a consumer in one country is often entirely unsuitable for a consumer in another country, even when intended for the same purpose.

The exporter is thus enabled through his experience to provide a market by means of suitable mixtures of coal for inferior class coals for which otherwise there would be little inducement to develop the output.

(c) To deliver coal from port of discharge into consumers' works inland.

(d) The exporter, especially when shipping small coal, has frequently to purchase 20 to 50 parcels from different collieries.

(e) It is an essential part of the duty of the exporter to have a complete understanding of the freight markets and to keep in touch with this market and with the opportunities of supplying tonnage at the time and place at which it is required to receive the output from the colliery.

(f) In connection with his duties the exporter provides a large and essential amount of working capital.

This working capital is required for the following purposes, i.e.—

The exporter pays the colliery within seven days but does not collect from the ultimate consumer for varying periods up to six months, and in this way the exporter finances the business during the intervening period.

The working capital is also required for the payment of insurance nearly always for payment of the usual one-third advance of freight at the port of loading, and often for the payment of the whole freight.

10. Witness will state that for the five years prior to the war the respective f.o.b. price of Welsh coal and the freights to the principal markets were as follows:—

16 May, 1919]

MR. THOMAS JOSEPH CALLAGHAN.

[Continued.]

	F.O.B. Price.		Rouen Freights	Genoa Freights	Port Saïd.	River Plate.
	Best Large.	Best Smalls.				
1909 ...	16 0	9 2	4 11	6 6	5 9	10 11
1910 ...	16 5	8 8	5 0½	6 8½	6 0	15 4½
1911 ...	17 8	9 3	4 11	8 1	7 5½	17 4
1912 ...	18 1	11 3	6 9	11 8	11 2	20 5½
1913 ...	20 3	12 6	5 9	8 8	6 2	17 4

Witness will also give the present freights and prices, which are (as controlled):—

1919.						
France and Italy.	40 0	28 6	19 6	47 6	47 6	—
Neutrals...	50 0	28 6	—	—	—	45-50

11. At the present time the Americans are selling their coal at approximately 6 dollars per ton f.o.b., and controlled freight is 18½ dollars River Plate, 19½ dollars Rio de Janeiro.

12. Witness will say that although for the present, under abnormal conditions, certain markets might bear an increase of cost, the competition with foreign countries may at any moment become so severe that not only will an increase not be maintainable, but a reduction in present prices will have to be made.

13. Coal from the South Wales coalfield is subject to foreign competition in the following markets:—

- French Market.*—Subject to the competition of German, Belgian and American coal.
- Italian Market.*—German and American.
- Mediterranean Market.*—Subject principally to competition of American coal.
- Scandinavian Market.*—Subject to competition of German and American coal.
- Far Eastern Market.*—Subject to competition of Japanese and Indian coal.
- South America (East).*—Subject to competition of American and to a small extent to South African coal.
- South America (West).*—Subject to competition of American and Australian coal.

14. In considering the competition of German coal it must be borne in mind that the German Exchange is so much against that country that Germany will be forced to largely increase her foreign exports of raw material, and particularly coal.

15. Foreign Depôts.

The establishment and feeding of foreign coaling depôts is an important element in the South Wales and Monmouthshire coal trade.

Generally speaking, it may be said that nearly the whole of the foreign coaling depôts are in the hands of Great Britain, and it is submitted that it is a matter of extreme public and National interest that this position of predominance in the carrying markets of the world should be maintained.

The depôt owners have expended many millions of pounds in the purchase of land, the laying down of plant and machinery, wharves, tugs, lighters, and other conveniences for facilitating the depôt business both in respect of the rapid bunkering of vessels and in the distribution of coal on shore in the neighbourhood of the depôts themselves.

16. Another important feature of the depôt business is that any increase in the price at which coal can be sold at the depôt will increase the cost of running steamers and thereby increases the general cost of freights on food and raw materials for the United Kingdom.

It is evident that if a shipowner knows that he has to pay a higher price for his bunker coal (which forms a large proportion of the cost of running his steamer) he is compelled to ask a higher freight than if he could buy bunkers cheaply.

This increase of freight naturally reacts upon the cost of all goods imported from abroad into the United Kingdom.

17. Mixing of Coal.

Twenty years ago there was little or no mixing of coal, but during that period the foreign demand has required coal to be provided to produce certain cal-

oric results, and the result has been that many large contracts such as those of the Italian State Railways, French Railways, and others comprise a sale of so many tons of coal conditioned to contain a certain specific analysis which is set out in the contract.

It is the duty of the merchant exporter to be well acquainted with the different coals from the different collieries in various portions of the coalfield, all of which vary, with the different seams in the different collieries.

The merchant with this knowledge is able to make provision for a mixture of coals which meets the precise terms and the analysis required by the foreign consumer.

This again is a function which no one colliery proprietor or central body could efficiently perform without setting up a very large and expensive organisation which would have to be trained over a number of years.

18. Witness is of opinion that to ensure progressive development of the coal industry it is essential to preserve private initiative. He submits that the development of the industry under private ownership in the past has been such as to deserve well of the country.

Table D shows, in periods of 5 years, how the industry has progressed both in South Wales and Monmouthshire and in the United Kingdom as a whole.

Witness is strongly opposed to any system of dual control in the management, as this in his opinion would be injurious to the country, to the mines, and to the miners. Witness trusts that some scheme acceptable to the miners may be put forward by the coalowners which, while safeguarding the aforementioned points, will give the miners a share in the results of their labour.

1917	48,508,000	248,473,000
Increase from 1899 to 1913 (15 years)	16,960,000	67,317,000
Increase from 1889 to 1913 (25 years)	28,766,000	110,495,000

19,457. Mr. Evan Williams: Your proof is so clear and convincing there is very little I want to ask you upon it. I think you have clearly shown the exporter and coal merchant is not a parasite, but performs important functions?—That is my view.

19,438. The export trade in South Wales and other districts is due entirely to the personal initiative and property of the exporter?—Very largely indeed. They were the pioneers of the trade in all countries.

19,459. Do you attach a great deal of value to the personal element in connection with your export trade?—Undoubtedly.

19,460. Is there any possibility of our export trade being carried on as efficiently if there is nationalisation; I do not mean the production part, but the export part?—I think, with regard to nationalisation, if there is any industry which ought not to be nationalised, it is the coal trade, because it is not an industry that is self-contained. There may be an argument with regard to the nationalisation of railways, but coal, especially as far as South Wales is concerned, is so largely dependent upon the export trade that it would, in my opinion, be extreme folly.

19,461. It is a trade that demands flexibility and rapidity of movement?—Not only so but we have to compete acutely with foreign countries, and the immediate effect, in my opinion, of the nationalisation of the collieries would be to give an advantage to America and Germany, assuming they do not nationalise, and I do not think there is much fear of that in America, in their competition with us.

19,462. There has been an argument used that exporters have a competition between themselves with regard to prices, and as high a price is not being got for the coal by the coal owners as might otherwise be got?—The coal exporter pays the market price, whatever it is. Whatever the market price of the day is he has to pay that to the colliery owner.

19,463. I speak more of the price he gets from abroad?—You mean he may sell at a cheap price?

19,464. He may cut the price to get the order in competition with a fellow competitor?—That often happens; he makes a mistake when he takes a contract and finds he has to pay the colliery afterwards a much higher price if the market price is higher.

19,465. Is it your view that the price that is got in that way after competition is reflecting on the colliery owner ultimately?—I do not think so. The colliery owners really look to the exporter as a buyer of coal, and that buyer pays whatever the colliery price is at the time the contract is made. There is no compulsion on the colliery owner. He is as open to judge as the exporter. He may refuse to make a contract, and say: "I think the market is going to rise and I will not contract, and I will only sell to you from hand to mouth."

19,466. Would you fear some kind of organisation between exporters to limit competition in this way or to control it for the export trade?—It would be very difficult. I do not see how it could be done, we are constantly in competition for different contracts in different parts of the world. I do not think any such combination could be made amongst exporters. It has been tried occasionally but it has been rarely successful.

19,467. It looks all right on paper?—It looks all right on paper, but there is somebody breaks away and cuts in.

19,468. In practice it is a thing very difficult to carry out?—Yes.

19,469. In fact, even during control there has been difficulty at certain periods to keep people from rather evading the Order?—That is so.

19,470. In your view the best way to carry on the export industry is as in the past by free competition by those engaged in it?—Certainly.

19,471. As far as South Wales is concerned, are there many unnecessary people who handle the coal between the coalowner and the ultimate exporter?—I think there is nobody—occasionally there are some people who buy coal on the market and sell it again on the market.

19,472. What is your view as to the elimination of these people?—That is a matter for the coalowners entirely. If they like to employ them they can, but they need not.

19,473. It is not a question of the coalowners employing them?—They need not sell to them. That is what I mean by employing. They employ them by selling to them.

19,474. You are largely interested in patent fuel works?—Yes.

19,475. There has been a very big development in patent fuel in South Wales?—Yes, we were one of the pioneers of patent fuel in South Wales.

19,476. The late head of your firm was the pioneer in South Wales?—I will not say the pioneer. He started over 50 years ago. He was a Frenchman.

16 May, 1919.]

Mr. THOMAS JOSEPH CALLAGHAN.

[Continued.]

He came from a French fuel works and brought the system over here and started a fuel works.

19,477. And at the present moment do you know whether there are prospects of expansion in the manufacture of patent fuel?—Yes, we arranged to take 12½ acres of land to build large fuel works at Barry. That was before the war. Everything is stopped now. During the war we could not build, and since the war we are waiting to see the result of this Commission and what Parliament decides. Then we shall go on with the development.

19,478. There are other people in the same position?—I have no doubt that is so.

19,479. At a former stage of this Commission we heard a great deal about the working of wagons. What is the most efficient method of getting the most out of wagons in South Wales in your opinion?—It is a question I have not considered specially.

Chairman: May I suggest that this is one of the units we are going to attack afterwards and we need not trouble about it now.

19,480. *Mr. Evan Williams:* You are Vice-Chairman of the Central Executive Committee for the supply of coal to France and Italy?—Yes.

19,481. In 1916 prices had soared up considerably for the export trade?—Before the Limitation Scheme?

19,482. Yes.—Yes.

19,483. With regard to the reduction of price made to France and Italy, there was no increase of the price until after the Government control was established?—That is so.

19,484. The price was maintained?—At 30s., for the best coal and it was a pretty universal price at that time.

19,485. That price was reduced from something considerably higher than 30s.?—Yes, 50s. or 60s.

19,486. That price was reduced voluntarily?—Yes.

19,487. Since then it has been put up by the Coal Controller?—That is so.

19,488. You have had considerable experience as a coalowner as well?—Yes.

19,489. Not always a fortunate one?—Unfortunately not.

19,490. You have lost a great deal of money in collieries?—I and my firm, as coalowners 25 years ago, I should think, were working the Rhondda Merthyr colliery, and after working it for about 10 years it was abandoned at a loss of £80,000 or £85,000. Then we had a similar experience in your neighbourhood, at Gueret's Graigola. There we worked, I forgot how many years, but about ten at a loss. Not that the coal was not cheap to work, it was cheap and good but it was very small, nearly all small; after going on we got tired of it and abandoned. On that the loss was something like £105,000, the loss in working and capital expenditure. That has come to my mind. I am glad you asked that question. Evidence has been given that the profits of the coalmining industry have been, I am not sure whether it was 9 or 9½ per cent., I do not think losses such as that, and that is not the only one, there are several others, the Naval Colliery is similar, but I will mention that later—I do not think in that profit of 9 per cent. or 9½ per cent. whichever the evidence was given as the average of the coal industry, the losses of collieries such as ours, and ours was only one experience of many, which have been taken into account. I mentioned the Naval Colliery. I am the Chairman of the Naval Colliery Company. The Naval Colliery Company has had a very chequered history. The original people who sunk the mine lost—I do not know it of my own personal knowledge but we asked one of the descendants and he said they lost anything between £100,000 and £150,000. Then a company was formed of nine gentlemen of whom the founder of our company was one and they put together £60,000 and worked it for 10 years. They lost all their capital, and in all, with working losses, they lost about £110,000, and they would not go on. We were the shipping agents and we advanced certain moneys, and rather than see that money go we took on the colliery for the value of our mortgages.

19,491. Your point is that the figure of 9 per cent. is an average of the profits without deduction of the losses?—Yes, so it seems to me.

19,492. Those losses have not been considered?—I think not. I should like to ask the question—it is an important question and being raised all over the country—if the losses which have been sustained have been taken account of by the Treasury officials who gave the information.

19,493. With regard to the regularity of working of the pits we have had some discussion on this Commission about that—I mean stocking. Do you think there are any mines in South Wales where better regularity can be obtained?—I do not think it is possible to stock coal. Coal would deteriorate if stocked, if you mean by stocking putting on the bank. There is not the room at most collieries to stock coal. You have to put it into trucks.

19,494. Would nationalised ownership or any sort of unified ownership affect the regularity of working?—It would not, as far as the bulk of collieries in South Wales are concerned. The geological conditions forbid; our collieries are in narrow valleys and there is not the room to stock coal.

19,495. No system of underworking or community of working would improve the question of regulating apart from stocking?—I would not say that absolutely, I do not think it is practicable.

19,496. Baths were put up at patent fuel works?

Chairman: Patent fuel works stand in rather a different position. There there was the pitch cancer. By all means ask the question.

19,497. *Mr. Evan Williams:* You have had by law to put up baths?—After the departmental enquiry of the Home Office all the fuel works had to put them up.

19,498. There is an obligation to put them up?—Yes.

19,499. Is there an obligation upon the man to use them?—No.

19,500. Do they use them?—No. I made that enquiry last week. My brother, the manager, said they are not used except for washing their hands and faces; they never use them as baths, simply as lavatories.

19,501. What sort of baths are they?—The baths we were ordered to put up, complete with drying places for the clothes and shower baths and so forth.

19,502. *Mr. Frank Hodges:* I have not many questions, because this question of export has been gone into by previous witnesses from South Wales; Sir Thomas Watson for example. There are one or two questions in connection with your answers to Mr. Evan Williams. You find the export trade more profitable than the production of coal?—Certainly.

19,503. You abandoned production in favour of distribution?—We have not abandoned.

19,504. Are you still interested in collieries?—Yes; I said I was Chairman of the Naval Colliery Company.

19,505. I thought you were referring to collieries over which you had lost £181,000 and abandoned?—That was the Rhondda, Merthyr and Gueret's Graigola.

19,506. That was some time ago?—25 years ago since they were abandoned.

19,507. Are you a shipper?—Yes; a shipper and exporter, you know, are interchangeable terms.

19,508. Practically one and the same person are they not?—Yes.

19,509. Do you know that you are essentially dependent upon continuous production of coal in South Wales?—Yes.

19,510. And the prosperity of Cardiff and other seaport towns you mention are, except Swansea, entirely dependent upon the export of coal?—That is so.

19,511. Therefore you would hope to have steady production in coal?—Yes, certainly a steady increase such as we have had in the past, if possible.

19,512. I notice you had very steady increases both in output and in the total shipped?—Yes.

19,513. You have had 10,000,000 more tons shipped in 1913 than in 1914, according to this table?—Yes.

19,514. You have not had much cause to complain of foreign competition?—I am not complaining. What I am anxious about it that the steady increases should continue so that we can still compete abroad.

19,515. This long list of competitors is put in to remind us there are such competitors in the world, but they do not necessarily oust us out of the coal

16 May, 1919.]

Mr. THOMAS JOSEPH CALLAGHAN.

[Continued.]

market?—They oust us out of the particular market. That is what we claim. When they oust us out of one we find another.

19,516. By finding another you increased your total shipping output by 10,000,000 tons in 10 years?—Happily for us.

19,517. In what sense do you think nationalisation of the mines will affect you as exporters?—I think nationalisation of the mines would tend to decrease output and not to increase it.

19,518. Why?—Because the initiative of private ownership being absent I do not think you would get the same output.

19,519. Your initiative was not particularly fruitful?—I do not know; although we lost money on the coal we turned it out. We could not go on indefinitely.

19,520. You have not drawn on your own experience to prove initiative is absolutely indispensable in making a colliery a profit concern?—I do not agree. I think the mere fact that we did lose on two collieries £200,000 shows that our initiative was to the advantage of the country although we had to abandon in the end.

19,521. That is a paradoxical remark that is rather beyond me, I confess. I gather from your paper, which is very interesting, your principal concern is that nationalisation will so affect output as to influence your position disadvantageously on the markets?—Not only our position, but the position of the country. The view I take is that exports are so essential for the country that if you do anything to diminish exports you are doing great harm to the country. What I am afraid of is that nationalisation will do that. I am not an authority on what is going on in other countries. I do not think in Germany, for instance, where they nationalised the mines, it has been a success by any means.

19,522. We have no material evidence before the Commission that they have nationalised them?—They have nationalised some of them. Those that are nationalised I believe are less successful.

19,523. If the welfare of South Wales is dependent upon continued productivity, can you see in the present relation between employer and employed in South Wales any prospect of continued progressive productivity?—I am bound to say the present position is most unsatisfactory.

19,524. I daresay you would be the first to admit, of all the coalfields in this Kingdom there has been a greater loss of output through industrial strife in South Wales than in any of them?—I think that is right.

19,525. Even from the point of view of the future prosperity of South Wales something different must happen from what is existing there to-day?—Yes, I agree.

19,526. It may not surprise you to know that there has been 458,000 workpeople involved in disputes this year in the mining industry, the principal of which has been in South Wales?—I do not know the figures.

19,527. I have some official figures which indicate that over 2,000,000 working days have been lost altogether in the mining industries in the country since January of this year, most of which have been lost in South Wales. What do you suggest, as a man of considerable experience not necessarily bound up with the Coalowners' Association, as a possible remedy for continued production in South Wales as against the existing system?—I prefer that question to be answered from coalowners. They have considered that matter. I am not in the confidence of the Committee that is dealing with this matter. I think there is a Committee dealing with it, and I prefer them to answer.

19,528. That is exactly it?

19,529. *Chairman*: Have you an unbiassed view?—I should like to see some scheme adopted which, as I say, in my evidence, will give satisfaction to the men, if it be possible, which will, first of all, do away with any question of nationalisation; do away with any question of dual control, which I think will be a fatal thing to output, and any scheme which will arrive

at that end which will assist in getting more production would have my strong approval.

19,530. *Chairman*: Cannot you condescend to details a little? You are an unbiassed gentleman interested in the trade for many years and you tell us the present state is most unsatisfactory. Cannot you give us an idea with regard to it? It is quite easy to say: "I hope something can be done satisfactorily." That is a pious opinion and it does not assist us. Cannot you give us some sort of an idea?—Any system by which the men would have an Advisory Board or anything of that sort for consultation with the owners as far as I am concerned—I am not speaking now as a coalowner—would meet with my approval, and to give them a larger profit in the result of their work; something based, not simply on the profits, but on the production.

19,531. *Mr. Frank Hodges*: That is rather disappointing to me at any rate. Have you prejudged the position of nationalisation?—No.

19,532. You have been struggling mentally in a general way to try to satisfy yourself that the present system can be altered by something else which you have not thought out?—It is not for me; it is for the coalowners to think that out.

19,533. If you had said: "I am not so sure nationalisation is a bad thing or is a good thing" I should have understood your latter decision?—I am quite prepared to admit in nationalisation there are some advantages.

19,534. Thank you for that.

Chairman: Tell us what they are?—I have listened to some evidence to-day of a colliery being unable to work a certain seam of coal because it was not in their boundary and having to work it a mile or two further off. Those sort of things do undoubtedly happen in private ownership. They could be remedied in another way, you could have a board without nationalisation, but nationalisation would be a remedy of that point.

19,535. I do want your assistance as a gentleman of great experience. You said just now you saw that nationalisation would produce some advantages. What are they?—That is one.

19,536. Then you say that can be done by another system?—Nationalisation would itself be a remedy, as under that system coal would naturally be worked from the nearest pit.

19,537. *Mr. Frank Hodges*: That is to say, apart from the mines altogether you would consider it an advantage to have the minerals nationalised?—Yes, that would meet the point. I do think personally that the minerals ought to belong to the State just the same as gold and silver do. I think the State ought to own the minerals, but I think the present owners ought to be amply compensated.

19,538. That is another matter.—That is unquestionable.

19,539. I put to you this position. I know your position in South Wales pretty well. I know people expect you to offer an opinion because of the welfare of the Principality as to how the coal trade can be conducted to the best advantage of the Principality in the future. That is where I am trying to get you to help us. You agree as a first principle the nationalisation of the minerals will be a step in the right direction provided the present owners were adequately compensated?—Yes, I do.

19,540. In view of the attitude of mind of miners, and of the Welsh miners in particular, and you and I know the Welsh miners pretty well, and in view of their clamant desire to have some form of effective control in production, have you thought that desire has to be met in some way before you can get smooth production and uninterrupted production?—No. I have not thought of that. I have not been satisfied he has that clamant desire you seem to think. I have heard that a good many miners do not want nationalisation.

19,541. Have you heard that from the miners themselves?—Not directly, no.

19,542. You have never heard of any meeting of groups of miners indicating their opposition to nationalisation?—No, I have not.

16 May, 1919.]

MR. THOMAS JOSEPH CALLAGHAN.

[Continued.]

19,543. *Chairman*: You think something will have to be done to alter the present system, is that right?—With regard to minerals.

19,544. With regard to the coal mining industry, do you think it is satisfactory at present?—I think one thing that the leaders of the men ought to do is to try and infuse a better spirit into the miners.

(The witness withdrew.)

MR. HUGO ARTHUR CAMPBELL, sworn and examined.

19,547. I have your précis, but I want to ask you a question or two. You are prepared to testify as to the success of the State Coal Mines in New Zealand and New South Wales?—Particularly New Zealand.

19,548. Are you a native of New Zealand?—I was born and bred at Newcastle and I have been all my life in New South Wales among the coal mines in that country.

19,549. How long have you been in New Zealand?—I spent 12 years in New Zealand.

19,550. In what capacity?—Gold mining. I have organised both the gold mines and the coal mines. I have done a good deal of gold mining, but very little to do with coal mining.

19,551. How long have you been in this country?—Three years.

Chairman: I will now ask the Secretary to read your précis.

Secretary: "I am prepared to testify to the success of the State Coal Mines of New Zealand and New South Wales.

I have found the State Coal Mines of both New Zealand and New South Wales are made far safer for miners to work in than the coal mines owned and controlled by private enterprise.

The first consideration of the managers of the State Coal Mines is the protection and safety of the miners. They are more concerned about the lives and welfare of the miners than they are about anything else.

I have always found the miners in the State Coal Mines were allowed to earn much better wages than the miners could earn in the same country working for private coal companies.

The State Coal Mines are managed for the purpose of giving the miners the best standard of living possible. The private coal companies' mines are underground managed for the purpose of getting the largest amount of coal possible for the least amount of money.

This is the cause of the wretched miserable housing conditions and poverty of the miners and their dependents. It is also the cause of the industrial unrest among the miners. There is greater harmony between the management of the State Coal Mines and the miners employed therein than there is between the management of the private coal companies' mines and the miners employed therein.

The operations of the State Coal Mines of New Zealand and New South Wales greatly reduced the price of coal to the householder. The State produces the coal for the use of the people and not to make a profit out of them. In consequence, the State can sell the coal at a lesser rate than private enterprise. The private coal companies produce coal for profit and not for use."

19,552. *Mr. R. W. Cooper*: I see you speak about New South Wales?—I do not know so much about New South Wales as I do about New Zealand.

19,553. You say you are prepared to testify to the success of the State mines in New South Wales?—I might say "mine" instead of "mines" at Lithgow.

19,554. Were you in the room this afternoon when the Agent-General told us that the Government of New South Wales were not working any collieries?—Yes, I heard the Agent-General of New South Wales giving his evidence here.

19,555. Did you hear him tell us that?—Yes, but I do not think it is true.

19,556. Do you not?—No.

19,557. Let me ask you a question about New Zealand. How many State collieries are there in New Zealand?—There are three.

19,545. *Mr. Robert Smillie*: Will you come and help us? (Laughter.)

19,546. I understand your position is, while feeling that, you do not think it is part of your business to suggest anything?—No, I prefer to leave it to the coal-owners who have studied the matter; I have not. I came to give my evidence here principally as an exporter.

19,558. Give me their names?—The three mines are close together at Rununga on the West Coast.

19,559. Give me the names of the collieries?—I do not know the individual names or whether they have names or not.

19,560. Will you take it from me there are only two collieries in New Zealand?—There may be only two working. There are three. One was worked out recently.

19,561. I hold in my hand a paper for 1917 and 1918. Have you any information as to the number of miners employed by the State in New Zealand?—No, I have not.

19,562. Have you any information as to the output of the State owned collieries in New Zealand?—I want to say this—

19,563. Please answer the question, yes or no. Have you any information?—I want to say the State was producing coal for the internal use.

19,564. That is not my question. Have you any information as to the output of the State owned collieries in New Zealand?—I have not. I do not know the quantities.

19,565. Then why did you not say so? Have you any information as to the total output of coal in New Zealand?—No, I have not.

19,566. Have you any information as to the number of fatal accidents in the coal mines in New Zealand?—No.

19,567. Have you any information as to the financial result of the State Collieries in New Zealand?—Yes, they make a slight profit, or they did, up till when I left three years ago.

19,568. I am a little later than you. I am looking at figures with regard to the result of the State coal mines for the year ending 31st March, 1918. Have you any information as to the amount of time lost at the State collieries in New Zealand by strikes or other similar causes?—I would like, Mr. Chairman, to make a little explanation on what was stated by the Agent-General.

19,569. No. Please answer my question.

19,570. *Chairman*: You shall make any statement at the right moment. The gentleman is asking you a question. If you do not know, say so.—I want to say there was a statement made here, although it might be true, was most misleading.

19,571. *Mr. R. W. Cooper*: The witness is in your hands at present, and he must answer my questions.—I do not know; but I wanted to make that statement.

19,572. Make your statement when I have finished. At present I am asking you questions as to the extent of the coal mines of New Zealand. So far you tell me you know nothing. May I take that as the general result of your answers to me?—I know something about the prices of coal before the State opened the mines, and I know the wages of the miners before, and the wages of the miners afterwards.

19,573. Do you know anything about the time lost by strikes at the State owned collieries in New Zealand?—I do not know the amount; I think it is very small.

19,574. Let me read you the figures from the Government Publication. It is the Report of the Managers addressed to the Under Secretary of the Mines Department at Wellington, and it is published in compliance with the requirements of Section 118 of the Coal Mines Act of New Zealand,

16 May, 1919.]

Mr. HUGO CAMPBELL.

[Continued.]

1908. It is the Port Elizabeth Colliery. The total possible number of working days in the year ending 31st March, 1918, was 268, out of which the colliery worked 220 days. With regard to another colliery, the Liverpool Colliery, and these are the two State collieries, the total possible number of working days was 260 out of which the colliery worked 197½. What do you say to that?—There have been strikes in those mines, but the men in those mines are organised with the rest of the coal miners in New Zealand. The coal miners in other mines had trouble with their employers and they went out on strike in sympathy with their mates, and they did quite right.

19,575. *Mr. Sidney Webb*: I think you are giving evidence very largely from the point of view of the effect of the State coal mines in New Zealand on the price of coal to the consumer and on the condition of the miners?—Yes.

19,576. You have not in your head the statistical results?—No, I did not bring those.

19,577. As regards the price of coal to the consumer is it true when the State opened these mines and got them into working order the result was a reduction of price to the consumer?—When the State put the coal on the market for sale to householders they reduced the price from 1s. 6d. per cwt. to 1s. The State not only produces the coal but distributes it to the householder, and the State instantly increased the wages of the workers from 2s. 6d. to 3s. a day, and eventually they rose the wages all round 30s. week more than what were the wages of the coal miners before the State opened the mines.

19,578. Keep to the price for the moment to the householder. I gather from your answer that the Government of New Zealand had for its object the selling of the coal to consumer at as low a price as possible?—Yes.

19,579. That they therefore deliberately put the coal on the market at a lower price than had formerly been the custom?—Yes, 33 per cent. reduction they put the coal on the market at.

19,580. That is to say they forewent what would be called profit if it had been private enterprise?—The State does not produce or distribute the coal for profit. They do it for the good of the miners and the people.

19,581. Your statement meant the consumer got the coal cheaper?—The coal miner gets a great advantage and has been lifted in the standard of living and the consumer got a reduction on the coal.

(The witness withdrew.)

Mr. ROBERT GROSVENOR PERRY, sworn and examined.

Chairman: This is a witness as to various Public Departments. I am sure you will all read his proof with very great interest. Whether you think it necessary to ask any questions is a matter for you. This is the memorandum of Mr. Robert Grosvenor Perry, on the Control of Productive Operations by Public Departments. He says:—

"It may be of convenience to the Commission if I state that I am Chairman of the Association of British Chemical Manufacturers and Chairman of the National Sulphuric Acid Association. I was Chairman of Messrs. Chance & Hunt, Limited, Chemical Manufacturers, Oldbury, throughout the War, and resigned that position on January 31st, 1919.

Messrs. Chance & Hunt, Limited, were appointed by the then Secretary of State for War, under Agreement dated February 1st, 1915, manager of His Majesty's Factory, Oldbury, which was the first of the many National Factories erected in this country later on, for the production of the many materials and articles commonly called Munitions, which were found, as war developed, to be essential to the effective conduct of modern warfare.

By virtue of my position as Chairman of Chance & Hunt, I thus became simultaneously Responsible Manager, under Lord Moulton, for the construction and operation of the National Factory, known as H.M. Factory, Oldbury, set up for the production of the high explosive, Trinitrotoluene. I, therefore, have practical experience of the administration of

19,582. With regard to wages of the coalminers, you say the coalminers in the State enterprise are in the same Trade Union with the other coalminers of New Zealand?—Yes, and bound to stand by each other.

19,583. I gather from your answer, I do not know if I am right, those of them who work in the State mines earn higher wages than they do in private mines?—Yes. May I reply what that is?

19,584. Yes.—The State are far hotter employers than private enterprise, and the State never objects to reasonable demands made by the workers, and the State increases the hewing rate and the standard of living in the State mines of the State miners. There is an increase in the good standard of living for the miners of New Zealand.

19,585. Does that make the State mines popular with the other mine owners?—No, it has made them most unpopular.

19,586. Although you have not the figures in your head, you give us to understand the State mines have covered their expenses, or, at any rate, up to the time you left?

Mr. R. W. Cooper: I can give you the figures if you want them.

Sir Arthur Duckham: On this subject I should like the other figures this witness has given evidence upon.

Mr. Sidney Webb: The witness is giving evidence on oath.

Sir Arthur Duckham: I should like the figures.

Mr. Sidney Webb: He has given the figures.

Sir Arthur Duckham: I want them. I do not want what he remembers but the public figures.

19,587. *Mr. Sidney Webb*: For the moment his evidence has been given that the Government of New Zealand put the coal on the market deliberately at a lower price than the private colliery owner had been putting the coal on the market? Is that so?—Yes.

Sir Arthur Duckham: Those are the figures I want.

19,588. *Mr. Sidney Webb*: That is the evidence given. The Government of New Zealand would have made a larger profit out of the mines if it had charged the same price as the private colliery owner had been charging?—A considerable profit they would have made.

19,589. From your standpoint you think it is a success, and for the success of a State colliery system it should produce the coal for the consumer at the lowest price and give the best conditions of labour?—I think the production for profit has been a curse to the world.

19,590. That is what you mean by saying it has been a success?—Yes.

productive operations, both by private enterprise and under the ægis of a public Department.

In considering the problem of controlling productive operations by public Departments as opposed to private enterprise, I wish to state certain facts brought to light by the stress of this war, from which I deduce my conclusion

The first instance of the control of productive operations which I propose to cite is the control of the War Office over the arsenals and factories at Woolwich and Waltham Abbey. War disclosed the fact that one result of such control was that while Trinitrotoluene (commonly called T.N.T.) had been accepted as a standard high explosive for Great Britain in case of war, yet no preparation had been made at any productive centre controlled by the War Office for its manufacture. Not only was there no plant for this purpose in existence at those centres, but there was apparently no War Office official who was able to specify the process, or design the plant necessary for the bulk production of this explosive.

Shortly after the outbreak of war the dearth of High Explosive was so serious that a Committee under the Chairmanship of Lord Moulton was set up to consider and advise on the National position in connection with supplies of High Explosives and Propellants. My first experience with this Committee was on December 4th, 1914, when, in response to a telegram from Lord Moulton, I called upon him and

16 May, 1919.]

Mr. ROBERT GROSVENOR PERRY.

[Continued.]

learnt that he was in urgent need of high strength Nitric Acid in large quantities for the purpose of treating the Toluol obtainable from Gas Companies in order to manufacture T.N.T. This, and immediately subsequent conversations disclosing not only the extreme difficulty in the conveyance of high strength Nitric Acid about the country, but also the great urgency of the position, led, to Lord Moulton, acting on behalf of the then Secretary of State for War, Lord Kitchener, entering into an agreement with Messrs. Chance & Hunt, by which that company undertook to place the whole of its resources of personnel, plant, buildings and experience at the disposal of the Government,—in short, to act as Managers to the Government for the erection and operation of a National Factory for the production of high explosive.

The all-important condition asked for by the Company was that H.M. Government should provide a specification of the process to be employed, together with plans and drawings of the plant requisite, and take full responsibility for such process and plant proving effective for the purpose, assuming operation under efficient supervision.

It is here necessary to state that between December 15th, 1914, and January 14th, 1915, endeavours were made by the Government to fulfil this condition in regard to process and plant, but without success, and, on this account, actual operations could not commence at Oldbury. It was not until the arrival from South Africa of Mr. K. B. Quinan, a well-known American chemical engineer, on January 15th, 1915, that actual work began.

I do not wish to say more concerning the events at Oldbury, except that in 14 weeks, commencing on grass land, finished T.N.T. was obtained, and before the end of 1915 3,000 tons had been produced, and the serious shortage of shells so frequently referred to had been overcome.

It is necessary, however, to point out that this operation was based upon the utilisation by the Government of an existing organisation possessed by a private company, and not upon an organisation composed of Government officials.

The second National Factory to be commenced for explosive production was that of Queensferry, Chester, in the spring of 1915. This factory was organised by the Department of Explosive Supplies. The personnel was drawn, as to a very small proportion, from Government Departments, and as to the remainder from scientific and business men obtained not only in Great Britain, but also from the Colonies. It was subject to direct Government control. It did not commence production until the spring of 1916. There are many reasons which may be urged to account for the greater length of time taken to secure production at Queensferry as against Oldbury, and I do not desire to make detailed comparisons. My point is that the initial step taken to secure an adequate supply of high explosive was to utilise an existing firm of British manufacturers, which, with the full assistance of a Government Department, obtained results more quickly than were afterwards achieved.

In this connection, I think it would be convenient to refer to the evidence of Sir Leo Chiozza Money (page 545, par. 23), in which the following statement occurs:—

“The Ministry of Munitions, by setting up an Explosive Supply Department under Lord Moulton, retrieved the situation, which was a very serious one. Indeed, it is not too much to say that national enterprise during the war did in two years for the chemical industry more than had been done for it in many years by private enterprise.”

I am unable to confirm the accuracy of this statement. The Committee, under the chairmanship of Lord Moulton, referred to above as having been set up during the latter part of 1914, was merged, in the early part of January, 1915, into a Department of the War Office known as A.6. It was this Department, of whose energy and efficiency I cannot speak too highly, that took the steps with Messrs. Chance & Hunt and very many other British manufacturers

which resulted in the relief of the then most perilous situation in regard to the supply of necessary explosives. It was only some months later that the Ministry of Munitions was set up, and, though this Ministry afterwards absorbed the Department of Explosive Supplies, this Department was already in full swing as a part of the War Office. It is, therefore, inaccurate to say that this Department was set up by the Ministry of Munitions, nor would it be right for that Ministry to claim credit for the work done by that Department in its early days.

Reverting to the latter half of the quotation made above from Sir Leo Money's evidence, I wish to say that I think it would be more accurate to state that national “need,” when realised by Government Departments and communicated to industrialists, was met at least as much by the enterprise and energy of the latter as by the co-ordinating work properly undertaken by the former. In my view, the fact that the War Office was compelled to hand over to an entirely new Department (i.e., the Department of Explosive Supplies) the responsibility of providing such a vital need of war as explosives, constitutes an argument against complete reliance upon the principle of placing productive operations solely in the charge of Public Departments not subject to periodic judgment by results, as in the case of private enterprise.

It may be said that volume alone would necessitate any Public Department widely extending its personnel to meet the huge demand of this unprecedented war. But in this case, as I have shown, the functions of the new Department were not merely to extend existing operations, but included the far more serious problem of creating *ab initio* processes and plant which, in my view, should have been at hand, if only in small units, ready for the comparatively simple task of duplication. Furthermore, the new Department, when set up, was comprised of men drawn from the professional and industrial classes, with very few, if any, Government officials, and, as I have already stated, the knowledge of explosive manufacture came, not from a Government official, nor yet, even, from a British citizen, but from an American.

I now turn to the evidence of Mr. Sidney Webb (page 531, pars. 12,453 to 12,460, inclusive). In 12,457 the following occurs:—

“The Government production of sulphuric acid has been carried on, as I understand, from such factories as were available at a very much greater advantage than the manufacture of sulphuric acid under private enterprise.

“Q. 12,458. What do you mean by much greater advantage?—In this case, at much lower cost, but much more advantageous to the people concerned in the manufacture.”

I gather from this evidence that it is intended to claim that sulphuric acid plants erected and operated at State-owned factories produced acid much more cheaply than did the plants controlled by private manufacturers, and from this I dissent, nor have I ever seen statistics which justify this statement.

In my opinion, the best practice of British manufacturers, in both high and low strength sulphuric acid, was, at least, equal in efficiency and cost of production to the best results obtained by our overseas competitors. Further, that the sole reason for the smallness of our production of this high strength acid in pre-war days was the lack of demand, due, largely, to the absence of a dyo industry in this country.

In this connection, I would refer to the first step taken by a Public Department to deal with the sudden need for large quantities of high strength sulphuric acid. When, in the early autumn of 1914, the War Office wished to obtain high strength sulphuric acid, they met the situation by purchase from America. They did not do this without consultation with one or more sulphuric acid manufacturers, but, finding that the position in this country in regard to the production of this particular strength of acid was one in which very large quantities could only be provided after the erection of additional plant, they did not encourage the manufacturer to extend, but decided to purchase the supplies abroad. In the execution of this policy expert manufacturers were not consulted.

16 May, 1919.]

Mr. ROBERT GROSVENOR PERRY.

[Continued.]

insufficient precautions were taken in the transit overseas, the result being that ships were lost, large quantities of the product wasted, and, in my view, not more than 75 per cent. of what was brought over reached its destination. Worse still, the development in production of high strength sulphuric acid was hindered in this country owing to this action, and it was only when the Department of Explosive Supplies realised the position some months later that encouragement was given to British manufacturers to erect new plants or extend their old ones, and thus supply the need by home production.

I would, in addition, cite the purchase of T.N.T. as a case in point. Our early purchases from U.S.A. cost 4s. per lb. I am in a position to say that approximately 50,000 tons of T.N.T. made at Oldbury cost 14-4d. per lb., including every penny expended on any account (i.e., both capital and operative), and, even assuming what is untrue, that the Oldbury plant and buildings are worthless at the end.

I can further instance ammonium perchlorate, the need for which arose, and which was met by both national and privately erected works. I am informed that the State-owned factory at Langwith did not produce for many months after the privately erected works of the United Alkali Company, which latter works were begun three months after the date on which Langwith was commenced.

Again, let me instance the case of nitrate of ammonia, the demand for which grew to an extent reaching nearly 4,000 tons a week, whereas in pre-war days I do not think the country produced 100 tons a week. This huge demand was met by the Department of Explosive Supplies making known the need to manufacturers, who overcame the difficulties presented, devised new processes, and, by extending their own organisations, achieved results that at one time seemed impossible.

From the foregoing statement I deduce what, in my view, has been proved many times throughout the war, namely, that efficiency is best obtained by close co-operation between public Departments and private enterprise, rather than by the individual action of either separately. There also emerges quite clearly the need for public Departments to make known to industrialists more frequently and widely the possible requirements of the nation. If the Government official will realise this need and take advantage of the brains and energy waiting to supply it, I think the futuro holds small danger of a repetition of past events."

19,591. *Sir Arthur Duckham*: I think the point you wish to bring out in your second column is as to a factory which was constructed at Oldbury, if I may say so, by private enterprise; but inasmuch as it was managed for the Government it produced a product unknown at that time in 14 weeks?—Yes.

19,592. The other factory at Queensferry, Chester, built with the full knowledge of the Oldbury factory, but under State control. I mean the building was somewhere about nine months to a year?—That is so.

19,593. Even then the second had the full knowledge of the first?—Yes.

19,594. Is your opinion that a factory constructed under the particular management of a firm is more rapidly constructed, and from your evidence, afterwards more economically run than anything done by State enterprise?—I agree.

19,595. With regard to the manufacture of acids in this country you make a statement. I presume the question of acids refers to high strength acids as far as the State is concerned?—Yes.

19,596. Have you any figure of a privately owned concern to compare with a State owned concern at the present time or at the end of the war as to what they were producing. Was it approximately the same?—No. Prior to the war many thousands of tons of this high strength acid were sold by a private firm at a figure of £4 10s. per ton. That figure to-day could not be repeated, but the cost of production claimed by the State factories—

19,597. Was that with a full allowance for all the &c., such as overhead charges, and that kind of thing. I want you to include that?—Yes; the cost of produc-

tion claimed by the State factory to-day for that same quality of acid is £8 per ton. The two factories are not directly comparable, but I am prepared to state that the same private manufacturer has to-day a lower cost of production than the £8 per ton claimed by the Government.

19,598. There is a point I want to make clear. The question of the dye industry has been put forward at this Commission as a State enterprise to a very large extent. Is it not a fact that the dye industry of this country is very largely due to the private enterprise of the firm of Levinsteins?

Sir Chiozza Money: Who put that forward?

Sir Arthur Duckham: It has been brought forward.

Chairman: I do not remember it.

Sir Arthur Duckham: It has been brought forward?—The present position of the British dye industry is undoubtedly due largely to the energy of the private firms.

19,599. That is to say, the development has been more due to the private firms?—During recent years.

19,600. This last statement of yours, is that a statement you find held generally by people in your position?—May I ask you if you refer to my deductions?

19,601. Yes, in the last paragraph?—I think my answer is an unqualified affirmative.

19,602. I put it it means really you consider private enterprise assisted by the State with the co-operation of the State is the best thing for industry?—It is the most efficient way, I believe, of securing production.

19,603. *Sir L. Chiozza Money*: I believe you are the manager of an exceedingly successful war factory?—I was.

19,604. An exceedingly successful one?—It is very kind of you to say so.

19,605. Under Lord Moulton?—Yes.

19,606. I think you agree that every one at this Commission has paid a very high tribute to the work of Lord Moulton?—I entirely agree.

19,607. This factory that you mentioned was enlarged very greatly under the Explosive Supply Department?—May I give the figures.

19,608. Yes?—It began at 30 tons a week and finished at 586.

19,609. Who supplied the capital for the extension?—The Government.

19,610. It is not unfair to say they did organise, with your valuable help, this particular factory?—Undoubtedly.

19,611. And they were fortunate enough to secure your unmanagement?—We were the managers.

19,612. They went to work in a common sense way. They supplied various capital, plans and specifications, and got a capable manager. That is, roughly, what they did?—Thank you.

19,613. It is true, so far as T.N.T. is concerned, it was organised under Lord Moulton, with your assistance?—May I say with the assistance of a large and exceedingly efficient organisation of trained men?

19,614. Nevertheless, they did help you by supplying plant, money, and the rest of it, to expand it, otherwise you could not have done it?—I entirely agree.

19,615. Is that exactly what I say in the paragraph you criticise? Indeed, is it not true the only correction that needs to be made in that paragraph is this: that I did not put in the fact that the Explosive Supply Department began and had its origin at the War Office? It does not alter the argument about the co-operation between the State and private firms. If this paragraph was altered so as to read "The War Office, by setting up an Explosive Supply Department under Lord Moulton," that paragraph would be accurate?—If you leave out the words "The Ministry of Munitions" it would.

19,616. The Ministry of Munitions expanded the Explosive Supply Department out of all knowledge?—I cannot accept that.

19,617. It multiplied it over and over again after it took it up?—I should say it was the Department of Explosives Supply that expanded its factories as the needs of the war increased.

19,618. The Supply Department was a part of the Ministry of Munitions?—At a later date.

16 May, 1919.]

Mr. ROBERT GROSVENOR PERRY.

[Continued.]

19,619. At an early date in the war?—Yes.

19,620. Under the Ministry of Munitions it was expanded over and over again?—Yes.

19,621. This paragraph is accurate except it ought to say the War Office began the work?—Yes.

19,622. That does not alter the argument?—Is not there another point?

19,623. What is it?—I want to bring out the fact that the Explosives Department, despite the very vital commodity with which it was concerned, had to be set up by the War Office, an existing Government Department, whose function should have been to look after explosives.

19,624. You say you can confirm this statement. Out of your mouth you prove the truth of all I said, except you add you co-opt the War Office with the Ministry of Munitions with regard to the credit that ought to be paid to the Government Department. Is not that the fact?—I cannot agree with you entirely. I think you would prefer the actual truth, which is that the Department which you have said was so successful was set up by the War Office and not by the Ministry of Munitions.

19,625. I know the facts. When the Ministry of Munitions took over the Explosives Supply Department, if you compare that position with the position that obtained, say, in the middle of 1918, there is no comparison of the two things. One was a little thing; the other a very big thing?—I accept that.

19,626. Was not I right in saying the chief credit was due to the Ministry of Munitions and not to the War Office, and they are both Government Departments which does not affect the argument. The State did organise this industry during the war with the assistance of men like yourself?—I was concerned with the Explosives Supply Department.

19,627. You speak of sulphuric acid on page 2. Were the works you refer to the Gretna works?—I do not refer to any public works in particular.

19,628. Do you know anything about the sulphuric acid works at Gretna?—Yes.

19,629. Do you consider it a good plant?—Yes.

19,630. Do you consider it is capable of economic production?—It is capable of economic production, but you must remember sulphuric acid we get at Gretna must be used at Gretna to make something else, because Gretna is too far removed from points of consumption.

19,631. Is it not true that was set up for war purposes and cordite was manufactured at such a price as to save us an enormous sum of money in the purchase of cordite?—Yes.

19,632. Is not that a tribute to State enterprise?—Yes.

19,633. *Mr. Sidney Webb*: You criticise my statements made under cross-examination. You have set out this: "The Government production of sulphuric acid has been carried on, as I understand, from such factories as were available at a very much greater advantage than the manufacture of sulphuric acid under private enterprise." That means the Government factories were making sulphuric acid at a less cost than private enterprise. I had in my mind Gretna. I have seen the figures. No doubt you have?—Yes.

19,634. Was I not right, though I could not remember the figures, that the sulphuric acid produced at Gretna was being produced at a lower cost than, I do not say any factory in the country, but the great majority of factories in the country?—It is not fair to compare the best practice with the average practice.

19,635. Why not? The point of the argument is that the State factories will be throughout and are throughout of the best. One of the advantages of nationalisation is that you do make the standard throughout?—Let us have the average of the Government cost; not one.

19,636. The average sulphuric acid cost. You said in your answer that you granted the sulphuric acid was being made at less cost in the State factories?—No I did not.

19,637. You did. Do you dissent from the fact that the sulphuric acid at Gretna was being made at less cost by those at Gretna than the sulphuric acid that

was being made by private enterprise?—I cannot agree to that statement.

19,638. You say that private sulphuric acid was being produced at less cost than at Gretna?—Yes, and to-day.

19,639. Not to-day; I am not dealing with that?—All through the war it has been produced at less cost than at Gretna.

19,640. That is not the recollection of my figures. That is not my recollection of Mr. Quinan's document?—That is another matter.

19,641. I was justified in making that statement on Mr. Quinan's figures.

Sir Arthur Duckham: I think the figure is a matter of cost on the works. You may have a less cost, but you may have higher over head costs that do not appear at all in the figures.

19,642. *Mr. Sidney Webb*: My statement is accurate as far as it goes?—I cannot agree that Gretna or any other individual Government factory has produced sulphuric acid more cheaply than private enterprise.

19,643. I have sat on a Committee, and your testimony is contradicting the other testimony which I have had access to. You say the best practice of British manufacturers in sulphuric acid is equal in efficiency and cost of production to the best results obtained by our oversea competitors. That is not the statement I made?—Yes.

19,644. You quote here as if it were a contradiction of my statement?—I did not intend that.

19,645. With what relevancy was that quoted? The mere fact that the British sulphuric acid manufacturers did it better than the Germans is not a discussion between State and private enterprise?—There has been a great deal of discussion about it in this country. It has been stated that the industry is inefficient.

19,646. What have we to do between English sulphuric acid and German sulphuric acid?—I agree with you.

19,647. With regard to the sulphuric acid question, you state that even if sulphuric acid was produced at a lower cost at Gretna it has to be borne in mind it was heavy stuff and would have to be taken away to somewhere else—Gretna is not advantageously situated?—It must be utilised there.

19,648. Is that relevant when the Government wanted it there. The Government put up its factories where it wanted it. I was not asserting that the Gretna works would produce phosphate, but I said sulphuric acid?—My answer was with regard to a question I think Sir Leo asked me, if it was an economic production.

19,649. My statement was on production?—Your case was, it was cheaper at Gretna than anywhere else.

19,650. Then you do not differ from my statement with regard to production?—Which statement is that? I dissent from the statement that sulphuric acid was made at Gretna or, say, in controlled factories, at a much lower cost than by private enterprise.

19,651. Do you dissent from that statement as regards Gretna?—I do.

19,652. The Controller and Auditor General is not an expert in these things. He is an expert in accountancy. He does say, as a rule the output of the national factories compare favourably with the prices of private contractors?—I do not know what "output" means.

19,653. I think you know quite well what output means and what I mean by output. It comes to a difference in the figure. Have you not rather taken into account the Government is not making so much profit on its enterprise as the private manufacturer?—No.

19,654. Was not that what you meant?—No.

19,655. Is not that the effect of what you said?—No.

19,656. With regard to your last paragraph in which you say that efficiency is best obtained by a close co-operation between public departments and private enterprise, you suggest that is a good system. Would that be open to the criticism that the Government would enable the private employer to make larger profits?—Not necessarily.

16 May, 1919.]

Mr. ROBERT GROSVENOR PERRY.

[Continued.]

19,657. Do you suggest seriously as a plan for the coal industry that the Government should lend its co-operation and help to private enterprise in coal production in such a way that it would increase the profits of the coal producer?—I make no such statement.

19,658. I am trying to get what you suggest to us. What do you mean by this last paragraph. Do you suggest the Government should help the colliery proprietors to get the best possible result?—I suggest, in my opinion, efficiency is best obtained by co-operation between Public Departments and private enterprise.

19,659. Formulate that into words. This efficiency in production leads in the case of private enterprise, to larger profits. Is not the idea of private enterprise to get more profits?—That is one of them.

19,660. Will it not mean, other things being equal, larger profits?—It may do.

19,661. Are you suggesting the Government should lend its assistance to private enterprise that it should cause larger profits to be made. You have not thought of the effect on profits?—I have.

19,662. Do you think it would mean larger profits

or smaller profits. You tell me you had in view the effect on profits?—Yes.

19,663. What effect do you think that would have on profits. Would it leave profits absolutely unlimited; make them larger or smaller?—If efficiency throughout was equal, it would be the same.

19,664. You think the Government should co-operate with private enterprise, but that would have the result of leaving the profits of the industry neither larger or smaller?—The main thing would be it would reduce the cost of production.

19,665. What would be the effect on profit?—That depends on other countries besides our own.

19,666. What effect would that have on profits?—I cannot speak to that.

19,667. You say you think co-operation of Governments and private enterprise would tend to greater efficiency, and in private enterprise you cannot have greater efficiency without larger profits?—Do not you want efficiency?

19,668. I want to know if you would make larger profits?

19,669. *Chairman*: Do you understand the question?—My answer is yes.

(Adjourned to Tuesday morning at 10-30.)

SECOND STAGE—FIFTEENTH DAY.

TUESDAY, 20TH MAY, 1919.

PRESENT:

THE HON. MR. JUSTICE SANKEY (*in the Chair*).

MR. R. W. COOPER.

SIR ARTHUR DUCKHAM.

MR. FRANK HODGES.

SIR LEO CHIOZZA MONEY.

SIR ADAM NIMMO.

MR. ROBERT SMILLIE.

SIR ALLAN M. SMITH.

MR. HERBERT SMITH.

MR. R. H. TAWNEY.

MR. SIDNEY WEBB.

MR. EVAN WILLIAMS.

SIR RICHARD A. S. REDMAYNE (*Assessor*).

MR. ARNOLD D. McNAIR (*Secretary*).

MR. GILBERT STONE (*Assistant Secretary*).

The Rt. Hon. Baron GAINFORD OF HEADLAM, Affirmed and Examined.

19,670. *Chairman*: Your proof, which is headed "The Mining Association of Great Britain," says, in the first three paragraphs:—

"I am Vice-Chairman of Pease and Partners, Limited; a director of T. and R. W. Bower, Limited, owners of Allerton Main Collieries, Yorkshire; of the Broomhill Collieries, Limited, Northumberland; and have been engaged in the direction of collieries and ironworks for a period of 37 years. I am a member of the Durham Coal Owners' Association, and for many years have been a member of the Executive Council of the Mining Association of Great Britain. I am chairman of the National Association of Coke and Bye-Product Plant Owners. I am a member of the Committee of the Privy Council for Scientific and Industrial Research.

I have occupied the position of patronage secretary to the Treasury, and as a Minister of the Crown I have been Chancellor of the Duchy of Lancaster, President of the Board of Education, and Postmaster-General.

The evidence I shall give is given with the authority of the Mining Association of Great Britain, but as it is a voluntary association, it must be understood that anything I say cannot legally bind any particular member of the Association, nor, of course, any coal owners outside the Association."—Yes.

19,671. That is the method under which you will give evidence, and I will now ask you to be good enough to read your proof?—"I am opposed to the nationalisation of coal mines and to any system of management of collieries which involves joint or dual control. If I had only my own personal convenience to consult I should not be averse, at my age, to an arrangement by which my interest in the collieries with which I am associated were bought out on fair terms and in return for hard work and services rendered, and I could have leisure and equivalent compensation. But I feel it a public duty to do everything I can to oppose nationalisation and prevent the injury to Britain's commercial position that would follow in its train. I am convinced, through actual

20 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

experience as a director of collieries and a Minister of the Crown, that the nationalisation of the industry would be nothing less than a disaster to the nation.

By nationalisation I mean the purchase of mines by the State and the control and management of the mines so purchased by officials or servants of the State, nominated for the purpose, with or without representatives of the workmen.

As for joint control, this expression appears to me to be used in two quite distinct senses. Sometimes it is used to indicate a scheme by which different owners join in a unified control of some branch of the coal industry. At other times it is used to describe a system by which the workmen join with their employers in the control and management of the mine. In recommendation IX of the Chairman's Interim Report it seems to me joint control is used in the first of these senses (compare recommendation XI and contrast recommendation X). The sense in which I am using it in what I am about to say is, however, the second. I am opposed, for reasons which I will explain, to the workmen joining in the executive management of the collieries where they work, though I am strongly in favour of their being given fuller opportunities than they have had in the past of learning the conditions of the industry and conferring with the employers on matters of common interest.

Onus of Proof.

To justify so far-reaching and vital a change in the ownership and administration of the mines, I submit that the onus of proof lies with those who advocate it.

It is for them to show either (a) that nationalisation of every industry is necessary or desirable, or (b) that the mining industry possesses characteristics peculiar to itself which call for exceptional treatment and make nationalisation of it necessary or desirable.

(a) The questions put by the Commissioners on the left of the Chair appear to disclose, in the minds of all of them, a preconceived and settled opinion in favour of the nationalisation of every industry. Such a policy, I am convinced, would at all times and in every industrial country be disastrous to the whole nation and spell ruin to the workers themselves. But at a time of extreme financial stress like the present, when it is imperative to get industry restarted in the United Kingdom at the earliest possible moment, the mere fact of their talk of general nationalisation is paralysing enterprise, old and new, and constitutes a grave hindrance to the return of prosperity. I believe the nation as a whole has had more than enough of Government control, and is convinced that State management of industrial enterprise means waste, inefficiency, and want of progress. State ownership and management should be resorted to only if the peculiar circumstances of the specific undertaking preclude resort to private ownership and management.

(b) I utterly reject the idea that any such particular circumstances attach to the mining industry. And, leaving on one side the academic theorists, who, with no personal experience of conducting industry themselves, would like to nationalise all industry, I maintain it is for those who contend that there are such particular circumstances in the mining industry to make good at least the following propositions:—

Propositions.

THE NATIONALISERS MUST PROVE:—

- (1) That there are such particular circumstances (a) or (b), affecting the mining industry.
- (2) That such defects as there may be in the industry as at present conducted cannot be cured whilst still preserving the system of private ownership and management; or alternatively
- (2) That their remedies for curing those defects do not entail in themselves such drawbacks as to make the remedies impracticable or undesirable.
- (4) That those defects can be cured, i.e., got rid of, by nationalisation.

- (5) That the evils resulting from nationalisation would not be more injurious to the nation than the evils of the present system, which it is suggested nationalisation would cure.

I submit these propositions have not, so far, been—and for that matter cannot and will not be—made good; and I now proceed to give my reasons why the system of private ownership in mines is best for the State.

The case for nationalisation up to now has been presented to the Commission and the public partly by the evidence of witnesses like Mr. Straker in the first stage of the enquiry, and Mr. Webb and Sir Leo Money recently, and partly by statements of Commissioners made or implied in the course of questions put by Commissioners to witnesses. But neither in the evidence nor in the questions has there been any attempt to distinguish between arguments in favour of nationalisation generally and arguments based upon the characteristics of mining, peculiar to that industry as distinguished from others. And yet to a clear or indeed a sane judgment on the question such a distinction is vital. Let me illustrate my criticism: of all the various arguments put forward there are few which on examination do not appear equally applicable to every other industry. One of the chief arguments is that output will be increased by nationalisation because the miners will be more contented—that there will be less absenteeism or less friction or less unrest because the men will no longer feel they are earning profits for private capitalists, and that the "Government stroke" by the hewer's pick will, for the same reason, mean increase and not restriction of output. Another argument is that comparative costings between different undertakings will reduce costs of production all round: or that research can be conducted on a large scale.

All these arguments, like the attack on profit making as the basis of industry, may be sound or unsound—and I am convinced they are unsound—but they have nothing to do with mining in particular. They are equally applicable to cotton or steel making, or shipbuilding, or the chemical trade.

If the general case for Nationalisation—i.e., for nationalising all means of production—be rejected, the case for nationalising the mines because of peculiar conditions in the mining industry is reduced to very meagre proportions. If it has seemed to loom large in the public eye it is chiefly because of the confusion in which the general and the particular arguments have been mixed together in this enquiry. I repeat, the particular arguments, germane to the mining industry as such, are very few in number. They are based on certain defects or difficulties resulting from or connected with the present system. But I believe a satisfactory solution for the difficulty or remedy for the defect can be found which will preserve the advantages of private enterprise and render utterly unnecessary resort to so tremendous, so dangerous, and, in my opinion, so disastrous an experiment upon our commercial prosperity as Nationalisation. I deal with them in later parts of my proof.

I. NATIONALISATION.

I assert that of all staple trades the Coal Trade lends itself the least favourable to an experiment in nationalisation, that the mining industry is really the most intractable of all the industries, because of the character and variety of the problems involved. The impossibility of securing uniformity of plan and method in connection with the constantly varying operations of each colliery. The true position is really not understood by those who regard coal as the foundation of every industry; whereas it is those engaged in other industries who utilise the coal who are the more direct benefactors of the State. A stream of coal from a pit shaft is of no more value in itself than a stream of lava on the side of a volcano. It is its subsequent treatment that gives it value. It is the men who treat the coal by destroying its character who earn for the collier his wages. In other words, coal does not materialise unless it is subjected to a series of metamorphoses. It is the

20 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

brains and hands of other partners in the State than colliers that work up the raw material into something useful for the consumers. Ignoring for the moment the householder, there are at least seven workers in other industries to every one miner who ought to be first satisfied that the nationalisation of coal will be an advantage to the particular trades in which they are engaged.

It is easy to be attracted by the theory of nationalisation if you have no direct knowledge of the difficulties of coal mining, or if you fail to grasp the fact that mining is so varied and speculative an industry that it can only be run successfully on the basis of private enterprise and individual effort, or if you fail to realise that the remuneration of labour more than anything else depends upon the total profits of the industry. The advocates do not realise that there are vast issues at stake, what disastrous results would accrue to the nation in the event of failure, or the fact that if the experiment failed it would be almost impossible ever to recover the position.

Its Results.

The inevitable result of *Nationalisation* would be:—

- A.—(1) An increase in cost of production raising the price of coal (a) to the consumer at home, (b) for export.
- (2) As a result of the increased price at home many other National Industries dependent upon a cheap supply would collapse.
- (3) The increased cost for export would lead to a decrease in the quantity exported.
- (4) This would have most serious reactions to the prejudice of the shipping trade.

During 1913 out of 97,190,000 tons carried by vessels sailing outwards from this country 76,690,000 tons consisted of coal. The reduction of these outward cargoes of coal would result in vessels having to sail outwards in ballast, with the consequence that the homeward freight would have to be raised to cover both the outward and homeward voyage. C.P. 7401—7616.*

- (5) Increased freights would in turn produce an increased cost of the commodities imported, and in particular of the country's raw materials and food.

By the sequence of results indicated above our national prosperity would be jeopardised, and our trade as a whole would be imperilled and in my judgment, to a great extent, destroyed.

B.—A further and direct result would be the loss to the State of a very substantial revenue at present derived from Income Tax and Mineral Rights Duty.

C.—In my opinion the State would have to meet in addition heavy losses in capital expenditure and in the working of unprofitable collieries.

Past Development met National Needs.

When facts are examined it becomes apparent that no weight can be attached to the argument that since coal lies at the bottom of our industrial position, it ought not to be worked by individuals for private profit. The fact is that the production of coal in the past has been commensurate with the national needs; that it has been developed and worked with remarkable efficiency, and that for a number of years past the mines as a whole have net earned excessive profits for the shareholders, many of whom are comparatively poor people, but only a very moderate return on the money invested.

Illustration of Profits.

That there have been great fluctuations in the coal trade must be admitted. As an illustration, I give the case of Pease and Partners,

* Annual Statement of Navigation and Shipping of the United Kingdom, 1913.

Limited. During my first 10 years, 1882 to 1892, the firm were only able to distribute an average dividend of 1.6 per cent. per annum to their shareholders; during the 10 years before the war, 1904 to 1913, the dividend reached just under an average of 11 per cent. During 5 years we paid no dividend at all, and during another period of 5 years we paid just under an average of 15 per cent., and I regard my own firm as typical of many others. It is the speculative character of the Industry which attracts the private investor.

The profits submitted by the Inland Revenue show that the profits are not so great as those in other important industries of the country, and having regard to the fact that many collieries have been worked at a loss, and that the losses are not included in the statement of profits produced in the return, it is surprising that in an industry where large risks have to be expected, the average profit derived has been relatively small.

Development Due to Enterprise.

Coal owners have not been slow to risk their capital in the development of coal, and have taken risks which the State never could have undertaken, wherever there appeared to be any possible expectation of success. The development in output during the past 30 years prior to the war, from 128,000,000 tons to 288,000,000, and an increase in the men employed from 492,422 to 1,118,452, is eloquent testimony to the enterprise, initiative and skill which coal owners and their managers have brought to bear upon the industry. So far from necessary development having been retarded in the hands of the present owners, all available evidence shows that the full quantity of coal required from time to time by the nation has always been forthcoming, and an export trade has been steadily built up. (N.B.—16 million tons in 1873 to 82 million tons in 1913.)

Development on Efficient Lines.

Advantage has been taken of all the skill and knowledge which the progressive discoveries of mining and other engineers and scientists have made available for the conduct of the industry, and with all due respect to the interpretation which some people have placed on the paragraph in the Commission's Interim Report, condemning the present system of private ownership, I maintain that the system of private ownership, however it may be improved, will always hold the field against any other system. Instead of our being behindhand, Sir Richard Redmayne has stated that under private enterprise the mines have been laid out better than those in any other country, with possibly the exception of Belgium. The terms demanded by miners have frequently prevented and retarded fair trials being given to coal cutting and labour saving appliances which managers have been keen to introduce.

Progressive Character of Industry.

The mining industry to-day, taken as a whole, is run on highly efficient and progressive lines; it utilises and advises mining and engineering knowledge and skill as it develops, until to-day a modern colliery is equipped in accordance with the most advanced ideas, and even in connection with older collieries there is constant revision of methods, and the application of new and more up-to-date plant, and to whatever part of the colliery undertaking criticism is directed, it will be found that, with possibly a few exceptions, there has been continuous progress, and that this industry has nothing to fear by comparison with any other industry in the country.

You cannot compare the James Watt steam engine with a modern locomotive, yet at the time James Watt's discovery was epoch-making. All along the line in the mining industry the movement has been steadily from the lower to the higher, from the less efficient to the more efficient, and from dangerous methods to those calculated to prevent accidents and protect life.

20 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued]

Safety. The British Record.

Our records show we are not unmindful of the safety of the men we employ. The average death rates of miners in the five years ending 1912 were in U.S.A. 3.26 per 1,000; Germany 2.51 per 1,000; New Zealand 2.39 per 1,000; United Kingdom 1.18 per 1,000, and it is admitted there has been a steady diminution of serious accidents.

Mines Managers.

The managers of our mines are men of large experience, technical skill, qualified by long underground experience before they are certificated, and the mines worked under them are more efficiently managed than any mines in the world. I have visited mines in Mexico as well as in South Africa. There has been no evidence in particular, or of a specific character, submitted to the Commission, to show that the industry is wasteful or extravagant, although it must be recognised that efficiency must always be a relative term. A large number of particular cases must be advanced to justify such a charge. General statements are useless, and I venture to re-affirm that so far there has been no detailed statement which could be regarded as evidence to show that the mining industry should be taken out of the hands of the present owners and put under some entirely imaginary management unable to supply the experience, knowledge, skill and efficiency which the existing owners and managers have acquired.

The men in possession take a pride in such success as may have been attained through their achievements. That feeling contributes more to efficiency than any mere motive of gain.

From my experience as an administrator in the two Government departments which controlled, before the war, the largest number of persons employed by the State, I assert it would be impossible under a Mining Department run under a system of nationalisation to reach the same degree of efficiency as has been attained by private enterprise.

I give two illustrations of enterprise on the part of private owners which it would be impossible to expect from Government officials. The first is the case of the Horden Collieries Limited, which I have visited, and in which my firm holds an interest, and I include in my evidence the following statement signed by the Managing Director of the Company:

The Horden Collieries, Limited.

The history of this company is an example of the necessity for private enterprise in the development of Coal Mines.

The company was formed in 1900 and an appeal for capital was made to the public. The flotation was strongly criticised as being highly speculative in the following papers:

Daily Mail, February 6th, 1900; *Critic*, February 10th, 1900; *Economist*, February 10th, 1900; *Statist*, February 10th, 1900; *Financier*, February 9th, 1900; *Globe*, February 10th, 1900.

The criticism in the *Financier* was in the following terms:—

‘Investors who respond to the invitation to subscribe capital to the Horden Collieries Limited will not be able to exact much sympathy if the venture should turn out to be an unprofitable one, for the directors openly acknowledge in the prospectus that all undeveloped mining enterprises must necessarily be somewhat of a speculative character. Even this candid avowal, however, does not render the investment one which is deserving of support, for the elements of speculation exist in too marked a degree to encourage the public.’

The circumstances attending the formation of the company were that they purchased or leased mining rights of about 17,000 acres of which about one-half is under the sea and owned by the Crown. The property included the Castle Eden, Shotton and Hutton Henry Collieries. Two only of these properties have paid a dividend at all, and that only 2 per cent.

in one case and 5 per cent. in the other. They all came to grief owing to water trouble, and the whole of the share capital, amounting to about half a million pounds, spent over nearly 25 years, was lost.

As a result of an appeal for £250,000 by the Horden Collieries Limited to the public in 1900, only £45,000 payable over 5 years was subscribed, and the remainder of the capital was raised by the directors and their friends. The share capital now stands at £983,310, the debenture stock at £300,000 and loans at £139,000.

The difficulties which had to be faced in winning the coal were enormous; how they were surmounted is briefly as follows:—

Three shafts were sunk at the Horden Colliery, and water to the extent of 10,000 gallons per minute had to be pumped during this operation. The shafts had then to be ‘tubbed’ by upwards of 5,000 tons of cast iron segments to keep out the water and the running sand. It was six years before the first 1,000 tons per day was drawn. Since then 3,750 tons have been drawn in one day from Horden Colliery alone. The three shafts were sunk in order to have a third as a ‘stand-by’ in case of need—as little was known as to the nature of the ground to be sunk through. In sinking Hutton Henry one shaft was totally lost in the sand.

Shotton Colliery was unwatered and reopened and thousands of pounds have been spent here during the last 10 years in driving a main haulage way through stone to take the place of the five old main haulage ways in the various seams, the upkeep of which was very expensive, and caused much interruption to work. The benefit derived from all this expenditure is only now commencing to be reaped.

Two shafts at Blackhall were sunk, and this involved pumping 15,000 gallons of water (weighing 67 tons) per minute for many months until the water was ‘tubbed’ off. This consisted largely of sea water finding its way through fissures in the limestone. Here also 5,000 tons of cast iron segments were used. To make security doubly sure liquid cement was filled in behind the tubbing both at this colliery and at Horden to stop the flow of water from the limestone and sand in case of accident to the tubbing at any future time. All the boilers, engines and pumps used in the sinking were taken out and disposed of, and electrical pumps and winding engines were installed at great initial expense but with definite ultimate service. The sinking was commenced in August, 1908, and 1,000 tons per day were first drawn in August, 1915 (an interval of seven years). This colliery is capable of drawing 4,000 tons a day and is the largest purely electrically driven colliery in the country; in fact, it is the model on which the French (after several visits of inspection by their engineers) are proposing to re-construct their own ruined collieries.

The sinking and the electrical equipment of this colliery formed the subject of a paper read by Mr. Prest and Mr. Loggat before the Institution of Mining Engineers on June 4th, 1914.

Before leaving this part of the subject I must testify to the skill, endless resource and enormous energy shown by our manager, Mr. J. J. Prest, by whose indomitable perseverance and courage all difficulties were overcome.”

I do not know whether I may interpose here, but I should like to say that I am not suggesting for a moment, with a system of nationalisation, Mr. Prest would not be willing to afford the best services he possibly could under a system of that kind, but what I do suggest is that under the system of nationalisation he would never have had the chance:

“By-product coke oven plant has been erected at two of the collieries; electric power is generated from the waste heat, and the total expenditure on the collieries and coke ovens has exceeded one million and a half.

The company has expended nearly half a million on the building of over 2,000 workmen’s houses, in many of which electric light is installed. These houses will compare favourably with any modern workmen’s dwellings.

20 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

As the coal resources are so extensive, the main ways in the collieries are built on permanent lines, the roof supported by girders, and the sides bricked.

The collieries are equipped to draw nearly twice the present output of 6,000 tons a day, and when all collieries are fully at work and sufficient house accommodation provided, the daily yield will reach 10-12,000 tons.

In order to complete the undertaking, and re-equip the Castle Eden Colliery, nearly a further million sterling will be required, the greater portion of which will be for building further miners' houses.

Under normal circumstances the Castle Eden Colliery would now be re-opened. Electric pumps capable of dealing with 4,500 gallons of water a minute have been already installed at Blackhall Colliery, which lies to the dip of the flooded Castle Eden workings.

The amount expended over the first seven years after the company commenced operations and before any dividend was paid was about £800,000.

The publication of the Coal Industry Commission Interim Report has arrested all attempts of development and building, and consequently all plans for the re-opening of Castle Eden Colliery have been suspended.

E. R. WHITWELL,

Vice-Chairman and Managing Director.

May 2nd, 1919."

That is the end of the Managing Director's letter.

Then I come to the case of Thorne:—

"The other case is that of the Thorne Colliery, which Pease and Partners, Ltd. propose to develop in an entirely new district, about nine miles east of Doncaster. The coal believed by my firm to be underlying this area we expect to find 940 yards below the surface, a depth not previously reached by any coal shaft in this country."

For the purpose of accuracy I ought to say that while we intend to sink 940 yards, the Barnsley Seam ought to be found at 916 yards, according to the indication of the bore. The Barnsley Seam is at 916 yards and the Dunhill at 930. We intended to sink to both those seams, and to sink a total distance of 940 yards.

"It is admitted that the mining difficulties may be considerable owing to the high temperature in working the coal at such a depth; even the marketable quality of the coal cannot be determined until it is reached. I am satisfied that if I had been at the head of the Mining Department under a system of Nationalisation I could not have secured the support of my Department in proposals to exploit the taxpayers' money in an enterprise of so speculative a character. My firm has already spent in sinking, and over a process of freezing which they thought was the best way of getting through their difficulties in the water-bearing stratification, a sum of £393,900. Our estimate to complete the sinking under a new process of cementation would involve a further expenditure of £377,333. Had it not been for the appointment of the Commission we were proposing to at once proceed with this work. The maximum output of the colliery is intended to be about 1,200,000

tons per annum, but if we are to be restricted by Statute to only a profit of 1s. 2d. per ton, and make provision for renewals and depreciation, and allow 5 per cent. on capital during development, a profit of only about 4 per cent. would be all that could be ultimately distributed to the shareholders, even if we were relieved of providing housing accommodation for our workmen, and all our hopes were realised. Obviously, if that return represents the utmost prospective benefit to the shareholders, it would be quite impossible for us, as their trustees, to proceed with the undertaking. If the Company provided houses there would be a heavy loss and no return at all, unless a rent was charged such as no collier has ever been accustomed to pay.

Distribution.

It is asserted that the price paid for household coal is frequently excessive, and that this evil is attributable to a system of private ownership.

If for the purpose of argument I admit the evil exists, I reply that it has nothing to do with the private owning of collieries.

The coal owner sells, as presumably the State would do, in the best market, and if a buyer controls, say, all the depots in a town, he can employ middlemen and commission agents as he will, as he possesses a monopoly. If this sort of thing obtains, then it is the fault of the local authority or the consumers themselves for not having made other provision for the delivery of the coal.

I would call attention to the fact that, in the Chairman's Interim Report, page 14, where, out of the total price charged to the consumer in London of 44s., only 21s. 2d. is for coal 'as it comes from the pit.'

The cure for the evil is co-operation. The coal owner is only too anxious to see the margin between the pit price and the delivered price as low as possible.

It should, however, be remembered that these assumed evils of distribution relate to a comparatively small portion of the total output—only 12 per cent. of our coal goes to domestic use, but over 100 million tons per year are absorbed by our industries, and the balance by railways, gasworks, &c., and for export.

(N.B.—Six tons of materials, including 2 tons of coal, are required to produce a ton of pig iron.)"

Perhaps I should have said "of Cleveland pig iron." Haematite requires rather less than six tons.

"Collective Purchasing of Materials.

It is asserted by those who advocate the abolition of private enterprise in business that there would be a distinct advantage, in securing materials at the mines, if the State or some collective purchasing agency was established in a district to buy commodities in bulk, and then distribute them out as required to the respective collieries. For many years I paid much attention to the purchasing of supplies and stores, and my conclusions are that a large firm can purchase more cheaply than the State or than any large number of associated firms. I believe that small firms ought to associate together and arrange co-operative purchasing of certain materials, so as to secure any advantage attached to wholesale purchases, to prevent prices being unduly raised against them.

On the other hand, there is a great danger that, if too many firms become associated, a ring would be formed by vendors, and the colliery owners would have no option but to pay inflated prices for various commodities consumed and required at their mines.

The line, in my judgment, based on varied experience, should be drawn where purchasing can be done by one controlling head, but where the scale of purchase is so large that it cannot be personally supervised by one man it becomes unwieldy, for where this position is reached the evils of departmentalism enter. These evils are dilatoriness, red-tape, delays in procedure, lack of initiative in securing competing prices and lack of enterprise on the part of Civil servants. Absence of keen individual oversight into quality and detail inevitably results in less efficiency and higher cost.

Export Trade.

There are two other considerations why nationalisation should not be accepted, which I wish the Commission to bear in mind. One is that it is practically impossible for the export trade to adapt itself to any centralised system.

The exporter finds the foreign buyer, arranges conditions of sales (f.o.b. or c.i.f.), and frequently makes himself liable for the tonnage and sea freight, and the discharge of the coal at the port of destination, he stands the racket for the difference between the lading weight and the delivered quantity, for the import duties, and occasionally for the sampling and analysis of the coal, he finds the money for long credit, and takes the risk of the foreign buyers' solvency and commercial probity, often a considerable source of loss, and has to meet the variations in currency which occur between the trading countries.

20 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

It must be apparent a National Department is quite unsuited to undertake such obligations which are essential to this class of the trade. Some districts, notably Northumberland, depend almost entirely in normal time on their export trade, over 80 per cent. of its output being shipped.

All exporters I have met aver that if nationalisation is anything like 'control,' it spells disaster to our export trade. And may I add here that I am convinced that until we get rid of State control, such as it now exists, all further enterprise, development and reproductive employment in the industry will be stopped.

Coke Oven and By-Products.

The other consideration relates to the composite character of industries associated with the working and the utilisation of coal and its products at a colliery. The interests are diverse which owners do and can legitimately attach to their colliery operations: blast furnaces and steel works, electric power plant, foundries, coke ovens, bye-product plant, brick works, quarries, chemical works, inland waterways, docks, wharves, shipping, railways, wagon shops, farming, &c. These concerns are all worked in with the colliery establishment, and in the event of nationalisation of mines would present insoluble problems. Collieries are so interwoven into other interests that unless private ownership is to be abandoned in every trade and branch of production, there would be enormous difficulty in deciding where and how national and private interests were to be separated."

I do not know whether I might give an illustration of that position connected with Pease and Partners, the firm with which I am best connected.

19,672. Yes, please do so?—Pease & Partners have paid in wages in the last financial year ending 30th April, 1918, £1,524,000. Of those wages, £886,000 went to those who were working in and about the collieries. For their ironworks the wages were £235,000; our ironstone mines wages were £211,000; our coke making department wages were £107,000; to our chemical works staff we paid £35,000; to our wagon building and repairing shops we paid £2,000; and to the men employed at our limestone quarries we paid £30,000. In other words, of our total wages which we paid in the year, 58 per cent. went in payment to men employed at collieries, and 42 per cent. went in connection with these other divers interests which are all attached to our operations.

19,673. Can you tell us the number of men in relation to that?—The number of employees on 30th April, 1914, was 12,846—that is, before the war. On the 30th April, 1918, there were 12,726. Of those employed in connection with the coal, 7,845 were employed in 1914 and 7,989 in 1918—practically the same proportion.

19,674. Are the figures roughly about 8,000 and 4,000?—8,000 and 5,000 would be more accurate. May I give you the figures again? In 1914 (practically they are the same to-day) we paid wages to 12,846 employees. In and about the collieries for colliery operations, we paid 7,845 men. That is 12,800 as against 7,800.

19,675. *Chairman:* Will you now kindly proceed, Lord Gainford, with the reading of your statement?—"Moreover, some manufacturing works are attached to collieries, and materials other than those derived from coal are required to be treated with coal products and have to be obtained from elsewhere."

19,676. With regard to the people in and about the mine, numbering about 7,800, are you including the coke oven men?—The coke oven I regard as an entirely separate trade. It is a manufacturing trade, and the wages paid to the coke oven men are £107,000 as against £886,000 paid for coals.

19,677. You are not counting the coke oven men in those working in and about the collieries?—No.

19,678. *Mr. Robert Smillie:* Those engaged in the production of the coal are the 7,800?—That is so. Fifty-eight per cent. are engaged in the production of coal and 42 per cent. in other work which the firm carries on.

"Other entirely separate undertakings are placed by colliery owners at their collieries, some of the above are occasionally attached to blast furnace plants, some of which belong and some do not to the colliery firm. There are other outside firms engaged in competition with colliery firms in various processes and businesses. To attempt to deal with one interest by legislation would not be merely grossly unfair to individuals but be disastrous to many industries.

I append a copy of a statement recently presented to the Government, issued by the National Association of Coke and Bye-product Plant Owners against any interference in their industries by mining legislation.

1. The coking and bye-product industries were, during the war period, placed under the control of the Ministry of Munitions, and that Government department fixed the wages paid in the industries; controlled the selling prices of coke and bye-products; fixed, and paid, subsidies to the manufacturers to enable them to meet the increased cost of manufacture imposed upon them through war conditions; and assumed responsibility for the inspection of coke ovens and bye-product plants during the whole period of control.

2. The control of the Ministry of Munitions ended at 30th April, 1919, and the manufacturers submit that it would be unfair and inequitable in the extreme again to curtail their freedom by handing over their industries to the control of another Government department—namely, that of the Controller of Coal Mines.

3. The manufacturers point out that the ramifications of their industries extend far beyond the limits of the coal mining industry, inasmuch as a considerable tonnage of coke is manufactured at coke ovens, which are adjuncts to iron and steel works, but unconnected with collieries. Moreover, some coke ovens and bye-product plants are entirely self-contained, being connected neither with collieries nor iron and steel works, nor are they owned by colliery proprietors. In other cases the ovens and plants are owned and controlled by companies subsidiary to colliery companies, but they are nevertheless self-contained, having separate capital, separate balance sheets and accounts, and independent organisations.

4. It is also desired to lay emphasis on the great variety of products obtained in the coking and bye-product industries. Considerable developments have already taken place in the industries in a comparatively short space of years, and as a result of scientific research which has been and is at present being prosecuted, the manufacturers have every reason to hope and expect that further developments will result from such research in the near future. It is the desire of the manufacturers that they be allowed to continue uncontrolled and unfettered as far as practicable in order that the spirit of enterprise and individual initiative may not be checked but carefully fostered.

5. As an indication of the ramifications and developments of the industries (referred to in paragraphs 3 and 4 of this statement), it may be mentioned that the original bye-products obtained from the coking of coal fuels were sulphate of ammonia and tar. Since the early days of the industries, however, the following further products have been secured as the result of private research and enterprise, viz.—benzol and its homologues—*e.g.*, benzol, toluol, xenola, solvent naphtha, and heavy naphtha. In addition, large tar distilling plants have been erected, by means of which are recovered several varieties of light and heavy oils, while various acids are now extracted—*e.g.*, carbolic acid and cresylic acid. Owing to the large amount of sulphuric acid required in some of the processes above enumerated, special plants have been put down for its manufacture from imported raw material, whilst in some cases this gave rise to the erection of nitric acid plants. Moreover, special provision is made at some coking and bye-product plants for the supply of gas to neighbouring

20 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

towns and cities. Reference may here be made to the work on Coal Tar and Ammonia, by Lungo, of Zurich (1900 edition), which gives a list showing that there were at that time upwards of 200 compounds of coal tar used for innumerable purposes.

6. The manufacturers submit that the circumstances described in the preceding paragraphs prove the impracticability of fixing a line of demarcation for the purpose of including coke ovens and bye-product plants in any Bill which may be brought in to give effect to the provisions of Mr. Justice Sankoy's Report, and they urge that all coke ovens and bye-product plants should be excluded from such Bill on equitable grounds; and also that the whole industry should be left free from the control of Government departments.

7. It may be added with regard to legislation that coking and bye-product plants are subject to the provisions of the Factory Acts and to the supervision of the inspectors appointed under these Acts; the Coal Mines Acts have not in the past, and do not at present relate or apply to the coking and bye-product industries. Furthermore, the legislation relating to Excess Profits Duty applies to these industries on the same basis as to other industries, and the provisions of the Coal Mines Control Agreement (Confirmation) Act 1918 do not apply to the coking and bye-product industries either generally or in relation to excess profits.

II. UNIFICATION.

One of the arguments advanced in favour of unification is that enormous waste is going on against the national interest by reason of loss from unnecessary barriers being left, by water-logged areas, by coal being left which it is asserted ought to be worked, and which, by reason of a recalcitrant owner—either the owner of the minerals or the owner of the surface—is left underground instead of being brought to the surface. My reply is that the owner of underground mineral royalties as a rule grants suitable terms, and does so with the desire to meet his lessee, and after a good deal of experience I assert that I would much rather negotiate the terms of a lease with a private royalty owner than with a Government department who are not only slow in correspondence and in arriving at any decision, but who are so frightened of creating a new precedent that they become rigid, wooden and inelastic, and from whom concessions in the interest of the conduct of the industry can only be extracted with much difficulty. Moreover, this point should be borne in mind, that if a colliery firm gets into difficulties and is unable to work a royalty properly the terms of a lease would be much more quickly enforced, and the royalty sold to a purchaser who would carry on the industry in an up-to-date manner, than it would be if the royalty were transferred to be dealt with by the head of a Government department.

Lost Coal.

Coal may have been lost to the nation from causes which might have been prevented, but it cannot be asserted that such causes would not have occurred under a unification or State ownership system. Such losses are deplored, and avoided by individual owners to a much greater extent than they would be by Civil servants influenced by tradition and regulation, and who always can find plausible excuse to defend inactivity and procrastination.

Any loss of that kind is opposed to the interest both of the lesser and lessee.

Barriers.

It is said that coal has been lost to the nation by the retention of unnecessary barriers, and it has been estimated that from 3,000 to 4,000 million tons have thus been felt ungoten. The practicability of removing such barriers cannot be now ascertained without making a careful investigation in each case so as to find out the reasons which determined their retention and the feasibility of their removal.

Water-logged Areas.

The same remark applies generally to water-logged areas where it has been found impracticable to work out coal by reason of special water difficulties. It is impossible to dogmatise on the extent of the area or on any centralised or joint scheme being adopted which would leave this coal available. As in the case of barriers, each individual problem requires special investigation before a solution can be found.

Recalcitrant Owners.

But when minerals are held up through the unwillingness of an owner, in the interests of the nation it is essential that such coal should be set free, and it is obvious that a mineral or surface owner should not be allowed to obstruct the proper working of the coal measures, to the detriment of the national interest; but to insist that all abandoned barriers, bad or unprofitable seams or mines must be worked is absurd. The preservation of barriers often has safeguarded the lives of the workers and secured the winning of coal in areas which otherwise would have been drowned out and lost. Where a multiplication of small surface and mineral owners exists, adjacent to one another in a coalfield, an awkward problem has occasionally been presented. Heavy legal charges in the multiplication of leases, as well as extravagant demands made in isolated cases, have sometimes delayed and made negotiations troublesome. These difficulties have, however, in recent times been generally overcome by co-operative action on the part of the mineral owners in their own self-interest. All these problems can be and should be dealt with under a private ownership system, with some form of national machinery for securing more effectively and expeditiously the end in view without resorting to unification or nationalisation.

My first effort in Parliament, in 1893, was to introduce with the mining leaders, Mr. John Wilson and Mr. Charles Fenwick, a Mining Easements Bill, which contained proposals to secure powers to work coal when circumstances existed such as those described above. The Coal Conservation Committee dealt with problems of this kind, and suggested the appointment of a Minister of Mines, but the Land Acquisition and Valuation Committee appointed by the Minister of Reconstruction has gone again into the whole subject matter, and suggests a resolution for all these problems, to which I shall again refer.

Colliery Costs.

It has been suggested that a better system of keeping colliery costs could be devised under some unified system, with a view to promote economy in administration. I doubt whether very much can be done in this direction to the general advantage.

The advantage of accurate cost-keeping is the comparison of like with like, but the variations of each colliery undertaking differ so much that the comparison of many items at one colliery bears no relationship to those at another.

Take, for instance, the cost of steel ropes: one colliery raises the output with a heavy cage up a deep shaft; another draws small coal tubs up a drift on an inclined plane. The wear and tear on these ropes and the cost per ton for wire rope afford no case for useful comparison.

Or, if we take the case of the horse food consumed at a colliery where 200 ponies are worked underground, and another where the underground conditions only require the use of 10 for a similar output, the comparison of those two costs for horse-keeping per ton of coal raised can serve very little purpose.

To compare the costs of one half-year with those for the previous half-year at the same colliery exposes to the management the increased expenditure or the savings effected on each item, and these comparisons may prove of great value in promoting efficiency and economy in the administration of the colliery.

There is much similarity in the preparation of costs through the employment of eminent firms of accountants, and many firms I know have exchanged their costs with one another when either have thought it might lead to the detection and prevention of waste or extravagance.

20 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

Poorer Districts.

The question has been raised as to the possibility of doing something more by unification to help poorer districts and collieries to tide over periods of depression. Having watched repeated efforts which have been made by firms to secure organised restriction of output, so as to afford each other help and their miners continuous employment, I have come to the conclusion that such combinations are a mistake, and produce more evils than they do good. A colliery which ought not to be maintained as a separate entity, or is ill-equipped, or is a badly-managed concern, is encouraged, whilst the good and well-equipped and economically managed concerns are prejudiced. Such subsidies and doles promote reaction and retard progress. As a matter of fact, the closing of a colliery which it is believed ought to continue to be worked rarely occurs. Certain areas may be often closed down for a time, and particular seams or shafts abandoned, but methods are invariably devised to prevent the total abandonment of areas capable of being worked in the future. I could give many illustrations of this, and I am certain the competition between firms and collieries tends to promote efficiency and the most economical working.

Dual Control.

So far I have dealt with the question of nationalisation and unification as generally understood. The demand of the miners' leaders, however, appears to be for what is called Joint Control—that is, as I understand it, State purchase of the mines followed by Joint Control between officials of the Government and representatives of the Miners' Federation of Great Britain, each body having equal authority in respect of matters affecting the control and administration of the collieries.

Whilst we are prepared to give to the men full opportunity of making representations through organised channels and having those representations considered, yet any system which involves joint control in the management between the owners and the workmen is not only impracticable but will inevitably lead to the most disastrous results in the interests of the country. I cannot conceive of anything more futile than to attempt to manage a colliery by means of a committee or council upon which there was an equal representation of the existing management and of the workmen's representatives. The working conditions of a mine are not capable of being brought within such a system of control. In the first place certain statutory regulations have to be carried out for which the management alone can be responsible. Apart from this, rapid decisions have constantly to be made in respect of questions of safety and otherwise. To attempt to work collieries by means of committees would mean that these committees would become debating societies in which division of opinion might be expected rapidly to develop, with all the consequent results of want of cohesion and want of initiative. In my view it appears to be not only impracticable, but inconceivable that such a system of control and administration could possibly be introduced in the interests of the country.

Any system of joint control, whether between the State or with representatives of the miners, would be absolutely unworkable and subversive of discipline and detrimental to national interests, and I put it to one side at once, as there is no firm of employers who would carry on the industry for a moment if they were not going to continue to have the direction of the business, and the executive control of their undertaking; moreover, no self-respecting engineer that I have met is prepared to take the responsibility of working under any such system. It would not only endanger the lives of working men, and destroy all efficiency, but the property would be wasted, and the industry could not be run as a commercial or practical proposition.

I am authorised to say, on behalf of the Mining Association, that if owners are not to be left complete executive control, they will decline to accept the responsibility of carrying on the industry, and though they regard nationalisation as disastrous to the country, they feel they would, in such event, be driven to the only alternative—nationalisation on fair terms.

III. PRIVATE OWNERSHIP.

If private ownership is to be condemned in the coal trade, then other business undertakings which depend on private enterprise and initiative should be equally condemned, and it is right that the country should realise that if the suggestions made by a section of theorists are to be now accepted, it would mean that all hope for the revival of trade, which before the war, under a system of individual effort and private enterprise, had attained an unprecedented condition of prosperity, would be abandoned.

Mr. Sidney Webb stated in his evidence that mining engineers were lacking in ideas. No more unjust charge has ever been brought against a great profession. There is great freemasonry among those who are engaged in the industry. An engineer or manager no sooner develops an idea and puts it into operation, than he describes it to the society of which he is a member, whether it be the Institution of Mining Engineers or the National Association of Colliery Managers. He invites other members to see, adopt and improve on his ideas, so that important discoveries and inventions become rapidly available for the use of the whole industry. I am quite satisfied that under the administration of those who have the incentive of personal interest, reputation and gain, improvements will come more rapidly than under the management of men who are in the service of the State. My experience at the General Post Office showed me that it was impossible to pay under a Government system the kind of salary which is going to attract, into a profession under State employ, the best talent of the country. The salaries paid to heads of departments for whose devotion to duty and loyalty I have the greatest admiration, bear no relationship to those which capable men are able to secure outside the State service under any private ownership system. The Treasury restrict elasticity in an upward direction. It has been proved that the State cannot run industries so economically as private owners can. The costs in Government dockyards are generally believed to be out of all proportion to those in private yards. The National Telephone gave better service than the Post Office, and made a profit which the Post Office has lost, and in spite of the raising of the penny postage to three-halfpence, the one department at the Post Office hitherto carried on profitably is now losing money."

19,679. When you say: "The costs in Government dockyards are generally believed to be out of all proportion to those in private yards," does costs include wages there?—I must admit it has been practically impossible to obtain any fair indication of the return of cost in Government dockyards which you can compare with those in a private dockyard. For many years I was a director of a big ship-building yard on the Tyne. I made it a practice, so far as I could, to see exactly what was going on in the Government dockyards at that time, and to pick up all information I could. From that time to this no real comparison has been made. This is merely an expression of opinion by those who have visited privately owned dockyards and Government dockyards that I base my statement upon. It is not because I have any figures which really prove it, which have been supplied by the Government: "Moreover, under the influence of State management there is certainly no more inclination on the part of their servants to encourage the rapid adoption of new methods and up-to-date labour-saving appliances than there is in private enterprise concerns, and in my view more hands are required to do the same work under the State. No privately-managed concern would find it necessary, for instance, to place behind every five telephone exchange operators a supervisor to stand over and watch them. One reason for the increased cost of State control is the impossibility of a Departmental head ever being able to discharge an incompetent but honest Civil servant. Once in the service always in the service until a pension is secured, is the rule. Thus officials grow in numbers and the cost and *personnel* steadily increase.

May I give another illustration of the absurdity of the theorists who make suggestions as to how the system of coal mining can be improved under

20 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

Nationalisation. Mr. Sidney Webb states, on page 27 of the Nationalisation of the Coal Supply pamphlet, that 'there would be the accumulation of a large national stock of every kind and grade of coal in ample and widely distributed storage places.' 'There are many classes of coal which, if placed in a heap, would fire, and the whole heap would be destroyed.'

At the present moment, at the Broomhill Colliery, we have a heap of 40,000 tons of coal which we had to put down during the war because we could not find export trade for it. It is all on fire and we cannot put it out. "Mr. Sidney Webb, not being a practical man, does not take into consideration a fact like this. In accordance with the statement on page 46 the coal should be placed 'under cover.' As a hopper to store 2,000 tons of coal would cost £10,000, the cost of storing a two-months' output of coal—say 50,000,000 tons—produces a sum of £250,000,000. Such an expenditure, of course, has only to be stated to show how impracticable is the proposal, and upon what slender grounds the case for nationalisation is based. Under any storage scheme the coal cannot be put down on the ground and taken up under an increased cost of 2s. per ton, and the waste by breakage and by small coal being blown away, quite part from the danger of theft, would amount to several shillings per ton.

Mr. Sidney Webb further suggests that under a system of Nationalisation the community itself would bear the increased cost of coal production, and that every item of the cost of working would have to be kept in a most minute way (see pages 32 and 33), so that there would be no reduction in the cost of keeping accounts. In addition there is to be a new National Coal Board, containing presumably men who would be paid substantial salaries (page 29), possessing a staff of officials to whom in due time would have to be paid pensions by the State. There is also to be set up a Joint Committee for every district, whose members would have to be paid by the State. There is to be an additional staff engaged to protect the lives of the miners at each colliery, which presumably would also include a pension system; their salaries would, I presume, be about £500 apiece at the 3,300 collieries—approximately £2,000,000 a year. Obviously, coal, too, is to be supplied to all workmen free or at a low price. Such a system of Nationalisation means a corresponding increase in the price of coal to the general public and to the detriment of industries dependent upon fuel.

One fact appears never to be sufficiently grasped by those who advocate nationalisation—that no two collieries are alike; that each colliery possesses natural and physical features peculiar to itself, and not only are the conditions at each colliery different, but the seams at any one colliery may be constantly changing. The roofs, the floors, the gradients, the bands in the coal are subject to continual alterations in all parts of many seams, and yet, if the industry is to be carried on to the satisfaction of the consumer, the screening and sorting arrangements at the pithead have to be in many collieries of a more or less complex character, and the problem of each mine has to be studied by itself, not only from the mining point of view, but with a view to satisfying the consumer, and it is only through individual initiative, energy and skill that success is secured.

So far there has been no detailed plan submitted as to the kind of machinery required to carry out any system of nationalisation, other than those cited by Messrs. Webb and Money, who presumably think it must be in the hands of the State, and that control would be exercised from one centre. The experience that has been gained during the war in the Coal Mines Department is entirely against such an idea. It is found to be quite impracticable to deal with the mines from a central office. The whole system gets slowed down by the delays which are unavoidable in connection with such an organisation, and not only is there general dissatisfaction, but as a result, in all the trades which consume fuel, prices are artificially increased, to the detriment of trade as a whole. The lack of co-ordination is felt, and interest and initiative are steadily withdrawn. Under the present system of Government control the

men who are appointed to deal with the various departments are not men with special training and experience, who are best qualified to do the work. No system of devolution would work satisfactorily. To set up councils or committees in districts and endow permanent civil servants with executive functions to deal with detailed problems in collieries would imperil the industry. The industry would cease to go forward, because there was no real push behind it. There is no evidence anywhere to show that any commercial undertaking comparable with the mining industry can be satisfactorily run by a Government department. Without the initiative of financial results a much greater wastage would occur in many directions than under the present system of private ownership. I submit that it is unthinkable that this Commission should be induced by theorists or by the Miners' Federation to embark upon so gigantic an experiment and gamble with the welfare and prosperity of the nation, in the manner contemplated by the proposals so far formulated. In spite of the miners' assertions, I am satisfied that the output of coal per person employed will continue under State control to go down, and the cost of production go up, and I have not met a single consumer of coal in the country, on a large scale, who does not believe that the nationalisation of the mines will increase the price of the commodity, and give him less satisfaction. In the long run it will be found that the wages of the miners cannot be sustained at a higher level than the economic conditions of the country will allow, and therefore I do not think that the true interests of the miners themselves will be served by nationalisation. On the one hand, the liberty and freedom now enjoyed by individuals or groups of miners to enter into negotiations with employers will be replaced by hard and tight inelastic State regulations to which no exceptions can be made to meet the temporary necessities of the men; they will find the State is a harder taskmaster than the private owner. On the other hand, it may make little difference to the State official if the price of coal is enhanced by means of general concessions which involve a total increase in the cost of production.

Strife.

Perpetual strife between capital and labour is quite unreal. No such thing in practice occurs. The miner is no worse or better than other people in this respect: he will keep on causing trouble so long as he believes that he may gain some advantage to himself by doing so. All assumptions as to what will happen under Nationalisation are based on the belief that there is going to be some sudden change in the spirit of the miner, due to the change of ownership, and that he will, under the benign influence of the State, cease from troubling, and work better. Nothing of the sort will happen. The very fact that the State was the owner of the mines would be used by the miner as an argument for pushing his demands much further than would otherwise be the case.

Relations.

It is sometimes said that the relationship between the owners of the mines and their employees is so bad as to make Nationalisation essential in the interests of the country. The friction alleged to exist between employers and their workmen in the Mining industry is grossly exaggerated. That difficulties are more likely to arise in the mining industry between the employer and his workmen may be admitted, but this is due to the special and varying character of the problems that are constantly arising at the mines. Where you have constantly changing physical conditions, questions of this kind must inevitably arise, but it is not true to suggest that the relationship between owners and their workmen in the mining industry are so bad as to necessitate a change of ownership and control.

The machinery of conciliation in the mining industry is very complete. I attach herewith a series of charts to illustrate the system which obtains in the County of Durham.*

19,680. *Chairman:* I have circulated those charts. The first is "Durham County. Local arrangement for settling disputes as to value of work done." The

*See Appendix 82.

20 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

next one is: "Durham County. Local Disputes under Joint Committee Rules. Payments, Customs, Rent and Coals, Travelling Times, Hours, Interpretation of Agreements." The next one: "Durham County. Local Minimum Wage Disputes"; and the next: "Local arrangement for Cavil's Disputes." What does that mean?—In our county at the end of every quarter the men ballot amongst themselves for the different positions in the mines. The men as a rule are allowed to select their own working mates and they go into the place which has been selected by ballot. The system obtains with a view of trying to equalise the favourable and unfavourable working places in a colliery, so that all men should be treated alike. That is the system which obtains, and has met generally with the approval of the men employed, to which the owners take no exception whatsoever.

19,681. *Mr. Robert Smillie*: Lots are drawn for the working places?—Yes.

19,682. They are drawn quarterly?—Yes.

19,683. *Chairman*: The next one is: "Durham County. Supervision for safety of workmen." Then: "Fixing County Wages." The next one is: "Durham County. Alteration of existing Customs, Hours, Wages." Then the last one is: "Durham County. Proposed Colliery Joint Advisory Committee for Administrative Affairs, Housing, &c." What is the meaning of the word "Proposed"? When did you propose it?—These proposals have been under the consideration of the Durham coal owners for many months, and towards the end of the year we got into close touch with the representatives of the men, and we were anticipating that by the end of January we should have these arrangements completed, and until the difficulties occurred in connection with a general strike in the country, those negotiations were proceeding satisfactorily and we expected that they would have been carried through amicably.

19,684. I want to get at what you meant when you used the word "proposed." It is not a proposal consequent upon this Commission or anything to meet the Commission, but you had the matter in hand some time ago?—That is so. "It has been developed over many years and may be said to have evolved with the evolution of the industry itself. Increasingly the practice is followed of referring disputes to Joint Committees, and the various Conciliation Boards in the district are exercising an increasingly useful power in dealing with all questions that are of general interest. With few exceptions, the relations between the management at the colliery and the men are excellent. It is only those who stir up strife who could seriously contend that there are such disturbing factors at work in the mines in respect of the relationship between the management and the workmen."

19,685. In that last paragraph do your remarks refer to Durham and Northumberland only, or to Wales and Scotland as well?—I have not any experience, really, of any other district, therefore I ought not to express any opinion. It would be only hearsay opinion if I did so.

19,686. Thank you.—"The argument that by nationalisation the men would be 'promptly freed from a host of petty aggressions and injustices and the incessant nibbling of wages,' is purely imaginary assumption. Upon the side of the miner you have one of the most complete and highly-organised trade unions in the country, which not only protects the individual workman against any such abuse, but is constantly defining and carrying out a policy in favour of the workmen. Recently it has been more frequently the aggression of the miners—and often against the advice of their union officials, that has to be complained of than the aggression of the coal owner. Mines' managers and officials are very generally promoted from the ranks of the miners, and are indeed required by law to serve practically in the mines before they can qualify for appointment as officials. They are in daily intercourse with the men and live their lives amongst them, and the powerful motives of efficiency in their work and self-esteem demand that they should have in a high degree the confidence of the men whose work they direct and for whose safety they are responsible.

Housing Accommodation.

In regard to housing, I do not admit that coal owners have failed to do their duty. They have provided more houses for their workmen than have been provided by those engaged in any other industry that I can call to mind, with the exception of chocolate and soap, and upon some agricultural estates. Pease and Partners, Ltd., in the 10 years before the war, spent £70,680 in building 309 new houses and purchasing 56 others for their workmen, and have spent £12,400 during the war on other houses and have incurred a further expenditure of £13,170 in substantially improving their houses, quite apart from current expenditure on repairs. From my own personal knowledge, such expenditure is not exceptional. I know that colliery owners are actuated by the same humane considerations in regard to housing their workmen as actuate the leaders of the miners. The housing question, however, is a national problem, and must be dealt with as such, and through local government authorities.

Infantile Mortality.

Infantile mortality in colliery villages has nothing to do with the system of managing mines, and has merely been introduced to prejudice private ownership. Many firms have done what appeared to them possible, but there is a limit to their ability to interfere in the domestic life or in the homes of the workers whom they employ. For the three years I was at the Board of Education I studied the question of the physical condition of the children who entered our schools, and on humanitarian and educational and patriotic grounds I was anxious to improve their condition.

Lack of elementary hygienic knowledge and practice in regard to attention to teeth, eyes, adenoids, breathing, feeding, cleanliness and the ventilation of rooms during sleeping hours, have been the main contributory causes of illness and disease.

Evidence is conclusive that in all classes the ignorance of mothers, and the neglect of themselves and their children are contributory causes for excessive death rates, wherever they occur. I only regret I was unable to do more for the children, but every effort I made to secure powers for the Board of Education to deal with the mothers and children before the children attained school age was resisted by other State Departments. A national organisation creating infant clinics, crèches for infants, health committees and visiting nurses would have saved thousand of lives, and I can only hope the Health Department will soon cope with and remedy this crying evil.

Future Organisation of the Coal Industry.

1. In the interest of the country the Coal Industry must continue to be carried on under private ownership, so as

- (1) To maintain personal initiative and enterprise; and
- (2) To safeguard the interest of consumers.

Under private ownership full provision can be made for the better conservation of the mineral resources of the country, and for improving the relations between the owners and their workmen, by more closely identifying the interests of the workmen with the financial results of the industry, and making use, as far as practicable, of their experience.

2. CONSERVATION OF MINERAL RESOURCES.

The coal owners accept the principles laid down in the Report of the Coal Conservation Committee dated the 23rd January, 1918, and the Report of the Acquisition and Valuation of Land Committee appointed by the Ministry of Reconstruction, dated 18th March, 1919.

The second of these Committees was appointed by the Ministry of Reconstruction and recommends (1) The creation of a Sanctioning Authority to exercise, on proof that such is necessary in the national interest, compulsory powers. This authority is proposed to be constituted of members of both Houses of Parliament, with the addition of other persons of experience in various spheres of life, including Labour; (2) a Mining Department with initiative,

20 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

advisory and executive powers. In this department there would be centralised all the departmental duties of the State in connection with mining, and the department would receive and consider all applications for compulsory powers in connection with the working of minerals, and would report thereon to the sanctioning authority, and also make such recommendations to the sanctioning authority as the department might deem proper. Whenever it is necessary for development that any rights of user or working, or even ownership, should be obtained in respect of either surface or minerals, including the right to let down the surface, rights of way, or any other right in, over or under land, a compulsory order should be obtainable from the sanctioning authority, always subject to the corollary that just compensation must be paid to the party affected.

(3) A strong Advisory Council as an essential part of the machinery of the mining department, consisting of representatives of the mining industry, including labour, together with men eminent in branches of science connected with the industry. It would also have local sub-committees reporting to it, and similarly constituted.

3. RELATIONS WITH WORKMEN:

(a) Wages.

The wages of the workers in each district, instead of varying with the selling price of coal, should be regulated with reference to the profits resulting from the industry in that district. There should be determined:-

- (1) A minimum or standard rate of wages to be paid to each class of workman in that district, and which for the protection of the consumer should be fixed by machinery to be set up in conformity with the proposals of the National Industrial Council.
- (2) The particular items of cost, other than standard wages, which are to be included in the cost of production, to be determined in each district by qualified accountants appointed by and representing each party.
- (3) A standard rate per ton to provide a minimum return for and redemption of owners' capital to be determined for each district by qualified accountants, as above.

Any balance remaining after these items have been provided for should be divided between Labour and Capital in proportions to be agreed, the workmen receiving their proportion in the shape of a percentage addition to the standard rates of wages.

These additions to the standard rates of wages in each district would vary in accordance with the variation of profits shown by each periodical ascertainment in such district.

The ascertainments of the average profits of each district should be made quarterly by the accountants.

As the owners might, in times of depression, be required to pay a standard rate of wages when they would not be receiving the standard return on capital, any deficiency in any quarter in the standard return on capital should be made up out of the return in any subsequent quarter or quarters, before making any division between the owners and the workmen.

Questions arising with respect to any of the matters referred to in this paragraph, and the settlement of which is not otherwise provided for, shall be settled by the Joint District Committees or Conciliation Board referred to in the next paragraph.

(b) Co-operation of Workmen and Owners.

Machinery should be set up for the purpose of arranging all questions between the owners and the workmen, and making provision for the owners and workmen conferring upon all matters of particular or general interest relating to safety, production, efficiency and the well-being of the workers.

This machinery should consist of the establishment, or continuation where already established, of Joint Pit Committees, or other Consultative Local Committees without executive power. Any questions not

satisfactorily disposed of by any Pit or Local Committee should be referred to a Joint District Committee or Conciliation Board to be composed partly of owners or their representatives and partly of representatives of the workmen.

Districts should be those established under the Minimum Wage Act.

ADVANTAGES OF THE SCHEME.

Among the advantages of this scheme are the following: The restriction of operations through the withholding of reasonable facilities by surface or mineral owners is eliminated; the criticism levelled against private ownership in connection with barriers, support, pumping arrangements, &c., is fairly met; the Sanctioning Authority secures that public interests will not be obstructed while leaving individual enterprise full play; the conservation of coal is secured; a community of interest between workmen and employers is established alike in increasing output and in promoting economy of production; Joint Pit Committees will secure that full advantage is taken of the experience and practical knowledge of the workmen in all questions relating to safety and industrial efficiency; and the existing defects in the working of the present system are cured without losing the advantages of enterprise and initiative which private ownership and management has shown itself able to provide."

Chairman: We are very much obliged to you, Lord Gainford.

19,687. *Mr. Robert Smillie:* I think you had experience in the Education Department as well as in the Post Office?—Yes; I was nearly three years at the Board of Education as President.

19,688. Were you then a Member of the House of Commons?—I was.

19,689. Have you ever defended either or both of those Departments in the House of Commons?—I have replied to criticism annually raised against the Board of Education administration.

19,690. And the Post Office?—And similarly the Post Office.

19,691. Did you ever tell the House of Commons that those Departments were inefficient?—I have never hidden from anyone the view that I take as to the difference between concerns run by the State and those run under private enterprise. That is the difference which I am making to-day. I have never concealed from anyone my opinion with regard to State-run concerns as compared with private enterprise concerns.

19,692. Do you remember whether or not during the time you were at the Post Office criticism in the House of Commons was brought against it for inefficiency?—Are you speaking on the part of the representatives of the men?

19,693. No. I am speaking of members of the House of Commons?—There is not a single member whom I ever came across who was not prepared to attack the Post Office for inefficient facilities being given in his constituency. The discussions on the Post Office estimates were nearly always occupied by men raising questions of that kind.

19,694. Questions of administration?—Of administration.

19,695. Did you defend the Post Office and its administration against this criticism?—I did.

19,696. Was that honest?—Quite.

19,697. Did you feel yourself that it was inefficient in the administration of your Department?—I felt that the administration with the money which I had at my disposal was good and the best that I could secure under the Government system for the benefit of the people.

19,698. The best you could secure? Could you under any other system have secured better material to carry on your Department better?—If I had had no limitation with regard to salaries I could have secured a greater number of better men, because they would be more highly paid. But I ought to say this in connection with the Post Office: the Post Office when I was Postmaster-General was being carried on during a period of war, when most of

20 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

our best men were enlisted and serving abroad. I am speaking now specially of the engineers and telegraphists and men of that class; and I also ought to say that several of the men who hitherto would have been pensioned off remained on in the service of the Post Office in order to help us during a period when labour was short in every industry.

19,699. But I take it that the inefficiency which you deal with here to-day connected with the Government Departments does not apply only to the period of the war?—No. When I was at the Board of Education it was prior to the period of the war; therefore I thought it was only right to point out that my administration of the Post Office was during the period of the war when the circumstances were not normal.

19,700. You make the statement here this morning that generally speaking industries are not as efficiently carried on under Government Departments as they would be under private enterprise?—I say that each man in the service of both Departments over which I had control did his duty, but you could not expect from Civil Servants a departure from the regulations under which they take service in the various grades of work. They get a wage in connection with the grade of service in which they have been placed and the work which they have to perform. You get no elasticity in a service of that kind. It is the system and not the individual that I am condemning as being less efficient than private enterprise. It is the system and not the individuals; the individuals do that duty just as well as under a private enterprise.

19,701. I want to know, did you as a Government official and a member of the House of Commons, the head of a great department, condemn the system in the House of Commons and say that the system was not good?—There were many occasions when I said that I could not, having regard to the expenditure with which I was entrusted, do anything more than I was doing. Every departmental head who is worth his salt has ideas that he would like to develop for the benefit of the community, but all the ideas he has in connection with improvements in a public service have to be weighed by the controlling Cabinet, and it is the question of balancing their applications, having regard to the taxpayers' interest, which has also to be considered by a Government when propositions are put forward.

19,702. May we take it that it is a condition of employment that the Government official, the head of a public department, must hold his tongue when he finds that his department is not so efficient as it ought to be, and as he could make it, provided the system was changed?—The system is that when the head of any Government department thinks that something ought to be done, he makes a recommendation to the civil head of the department, the civil head of the department then sends up a written minute in the usual course to the temporary political head of the department, and then there is a conference as to how the suggestions for the improvement of the public service can be secured. The head of the department then directs the course which ought to be entertained, it may be to a financial committee of the Cabinet, it may be to some official of the Treasury who deal with that departmental work, that branch of the department; he directs what course ought to be taken with the view of securing such improvements as he thinks ought to be secured, in the general interest of his department.

19,703. I am afraid I am not putting my idea very clearly, or else you are not grasping it?—I am sorry.

19,704. The House of Commons is supposed to be representative of the people of this country, and from time to time members of the House of Commons have an opportunity of questioning the heads of the department, and of accusing that department of being inefficient. I want to put it to you, did you, as a matter of fact, defend your department, or did you admit that it was inefficient or might be otherwise if you had an opportunity of putting it right?—I pointed out that with the money which I had at my disposal I could not make it go further; but there

was not a single occasion on which I had the opportunity of addressing the House of Commons that I did not indicate that it was money that I wanted in order to secure further advance in progress in connection with that department's affairs.

19,705. You have moved to a different House now?—Yes.

19,706. You have changed your lodgings for the time being. Do you find greater efficiency in what is called the Upper House than in the other House?—In what direction are you speaking? In being able to raise subjects and to speak my mind, I find a freer opportunity in the House of Lords than exists in the House of Commons.

19,707. Are there any heads of departments there?—There are a few.

19,708. I suppose the nominal head of the Government in the House of Commons would defend the Government, and does defend the Government, against attack: he probably says it is the most efficient Government that has ever been in power. Is that not usually the method in both Houses?—The head of the Government, no doubt, is loyal to the Government as a whole. There is such a thing as collective responsibility usual in the Government, and the head of the Government naturally defends his Government from criticism when he thinks it has been unfairly attacked.

19,709. I suppose the head of a department in the same way in the House of Commons is loyal to defend a thing which in private life he alleges is absolutely inefficient. Is that not your own position to-day?—No: anything that was regarded as inefficient I never would have defended in the House of Commons. Take, for instance, one case to which I refer here, the inability to discharge an inefficient Civil Servant. I should have had no hesitation in the House of Commons, if a question had been put to me, "Under your present system can you discharge an inefficient but honest Civil Servant?"—I should have had at once to admit in the House of Commons that under the system it is practically impossible to discharge a man who is regularly coming to do his duty, even though I might go out into the street and obtain a better man in his place. That is the system: you cannot get rid of it.

19,710. Of course, knowing that that was the system, was it not your duty, without a question being put to you at all, to say, "My department is not nearly so good as it ought to be, or as good as I could make it if I had the power to discharge a person who is inefficient"?—I have often said it to my colleagues.

19,711. That is the difficulty of it: saying it to your colleagues is not saying it in the House of Commons?—They all say, "What is the remedy? and if you can tell me what it is, and secure a remedy for that condition of affairs, I think you will be doing a great service to your country."

19,712. I merely want to find out whether it is possible, if the mines are nationalised, that we can secure any method of working them efficiently, and your experience is that, so far as departments that you were actively engaged in were concerned, they were inefficient; but you never told the House of Commons that they were inefficient; you told the House of Commons that they were efficient?—I regarded them as efficiently carrying on the work which was entrusted to them with the limitations attributable to the system—that they did their duty.

19,713. If the limitations had been removed, would it have been possible to make them efficient?—Not unless you can get rid of the less efficient men. There are not many, but there were, in every department, men who, under the private enterprise system, would not have remained in the service. You know the system under which the Civil Servants are appointed: they go through a test of qualification and then they do service, and after a series of years they get into a routine system in which you find there are individuals who, under a private enterprise system, you might desire to remove in order to secure other people to take their place; but I say you never can, under such a system as now obtains—and I do not

20 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

know the cure for it—got rid of an honest, well-meaning Civil Servant who has a place in the Civil Service of the country.

19,714. Your point was that the department was carried on with the fullest efficiency which its limitations allow?—Yes.

19,715. I put it to you, if the limitations were removed, could the department be made efficient?—It would be made more efficient, because you would be able, by a different system of payment, to secure, I believe, better results.

19,716. But if you remove all limitations, could it be made efficient?—I doubt it. I doubt whether you can devise a system of getting rid of what I call the routine, honest, inefficient workman. They are the exception, but they do exist, I believe, in Government departments.

19,717. I suppose you would be aware of the fact that sometimes private firms in the mining trade, and in every other industry of this country, do not rid themselves of an old, valued and honest servant who may have become inefficient?—They often give him gratuities, or they find him work which he is capable, with his diminishing physical energy, to perform: but under the State no one remains there after the age of 65, and a great many are pensioned off at the age of 60. In private firms you do not treat your workmen in that way; you do not pension them off at the age of 60; you utilise their powers as long as they can help in the economic production of wealth.

19,718. Should I be correct in saying that nearly all the permanent officials in Government offices are of opinion at all times that the head of the department is the only inefficient person of the lot: is that correct?—I think the heads of departments are the most efficient.

19,719. I put it to you, should I be correct in saying that the vast number of Civil Servants in any department of the Government are practically unanimous in their opinion that the only inefficient person is the head of the department?—They have never expressed that view to me.

19,720. You would not expect them to do so? I do not wish you to take it for a moment that I am defending the Government for its inefficiency, but do you not think that it reflects on the intelligence of the people of this country that they have such an inefficient crowd in all the departments as you now allege?—Are you now speaking of the political heads or the commercial heads?

19,721. I am speaking of the people who elect the members to Parliament, and the Government that is formed out of that. Does it not show a want of intelligence on their part that we should have, in all our departments, persons who are inefficient, and inefficient departments?—I do not admit that they are inefficient.

19,722. You do not admit that the Government departments are inefficient?—No, I do not admit that the temporary heads of most of the Government departments are inefficient.

19,723. I do not allege that, but I put it to you that we have information from you—and you ought to know—that the departments are inefficient; and now I put it to you, does it prove that we are governed by an intelligent Government that allows inefficiency to remain in all the departments?—I believe that we are governed by an intelligent Government.

19,724. You believe that we are governed by an intelligent Government, and you allege that that intelligent Government allows from year to year all departments of State to be carried on inefficiently?—I have already asserted, and I assert, that every Government department is carried on as efficiently as the system will allow.

19,725. With limitation?—It is limited, as you know, by salaries: it is limited, as you know, by length of service and by pensions secured at a certain age.

19,726. Do you think that by forming a limited liability company and taking up shares in it to run the Government of this country, it could be made efficient?—I think that some of the branches of the

Government might have been run for the advantage of the country under a limited liability concern better than they have been run by the Government.

19,727. All those departments that you have mentioned are run by the Government, that is those departments are nationalised, and they are inefficient because of the limitations in the various departments. I want to know whether a limited liability company of coal owners, steel owners or railway people, might be formed to run the Government efficiently. Evidently we cannot do it?—I do not think you can deal with a problem of that kind. That is one of the difficulties that I pointed out, that if you nationalised a great industry such as the mining industry and the experiment fails you cannot revert very easily to the position which has been evolved over a vast number of years in building up another system on a private enterprise basis.

19,728. Your opinion of Government departments seems to be shared by a large number of witnesses who have given evidence here, that there is very little to be said for the efficiency of Government departments. Would you assist those who think with you in endeavouring to get that put right?—Certainly, I have always done my best throughout my whole parliamentary career to do anything I could to promote the efficiency of Government departments.

19,729. I think one of your reasons for your opposition to nationalisation is that your experience has proved to you that Government departments, as you know them, are incapable of running a great national industry?—I do not think they could run an industry at a profit, and I do not think that the industry will do any good to the country if it is going to be run at a loss. I do not say that it is not possible to carry on a certain number of collieries under a system of nationalisation, but I think anything of that kind would be disastrous.

19,730. Would it be possible to improve Government departments so that they might run intelligently the affairs to which they are appointed?—Not to the point when they could compete successfully with the advantages which are secured by a private enterprise system. All these, in my opinion, are relative, and you have to balance the advantages for and against different systems. I am convinced in my own mind that the advantages for private enterprise in connection with coal mining outweigh entirely the advantages which anybody can claim can be secured by nationalisation.

19,731. I think your firm is connected with the Broomhill Collieries, Ltd.?—No, I am director of the Broomhill Collieries Co., but the firm of Pease & Partners, with which I am closely associated, has nothing to do with the Broomhill Collieries.

19,732. How long have you been a director of the Broomhill Collieries?—I was a director before I became Postmaster-General. When I left the Government at the time of the Coalition I became a director of the Broomhill Collieries, Ltd. When I became Postmaster-General I resigned my position on that Board, and when I left the Post Office they re-elected me as a director of that Company.

19,733. Were you in the Company prior to joining the Post Office?—Yes.

19,734. How many years have you been a shareholder in it?—Only since 1915.

19,735. Do you know that that was not a very successful concern in its early days?—I know that its profits were not very great at one time: it has had fluctuations like most collieries.

19,736. I suppose you know that its shares were down almost to a point when they could be secured for nothing?—They were practically unsaleable at one time.

19,737. There was a time when, so far as the Broomhill Company was concerned, they would have been delighted with the idea of State ownership of mines?—I have no doubt the shareholders, if they could have got par value for their shares from the State, would have taken it. They were then at 4s. 6d. but they are now at 24s. to 25s.

19,738. The people who hold them at 25s. largely bought them, I think, at under 10s.?—You would have

20 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

to consult the books of the Company in order to ascertain when each share was transferred from one individual to another.

19,739. You do very often consult the share registers of a company when you have the opportunity. Has your proof been submitted to the Mining Association of Great Britain?—The Mining Association of Great Britain appointed an Executive Council: that Executive Council gave the whole of its powers to a Committee which was appointed to consider the question of giving evidence before this Commission. That Committee divided its work into three sub-Committees, and by a process of devolution a group of individuals representing different districts was appointed on that Committee, and that Committee have heard every word of my proof which I have read this morning.

19,740. You see you cannot legally bind even the members of the Mining Association of Great Britain, nor can you speak for any employers outside the Mining Association of Great Britain?—No.

19,741. You say in your proof that the gentlemen to the left of the Chairman have evidently made up their minds in favour of nationalisation?—They have given me that impression by the questions they have asked of the witnesses at the Commission and by their interim report.

19,742. Is it altogether fair for you to say that the gentlemen on the left of the Chairman have already made up their minds?—The impression I got by reading their interim report was that they had made up their minds on the principle of nationalisation of industries.

19,743. Would I be right in saying that you have made up your mind?—I have never wavered on this subject.

19,744. You have always been opposed to the nationalisation of mines?—Yes.

19,745. You say here you feel it to be a public duty to do everything you can to oppose nationalisation and prevent the injury to Britain's commercial position that would fall in its train?—Yes. I reiterate that as strongly as I possibly can.

19,746. What is your reason for saying that any injury to Britain's commercial position would follow on nationalisation?—If there is any justification for the nationalisation of coal mines I conceive there would be an equal justification for nationalising every other productive industry. The wealth of the country is secured by productive enterprise, and productive enterprise, in my view, is not stimulated by any system of nationalisation. The losses which would be created in nationalising the industry would not only have to be met out of the public purse, but there would be no profit for the public purse; so that we should in a very short time become bankrupt, and that is the reason why I believe it would be so disastrous to the industries of this country.

19,747. Do you not think that there is a very important difference between land and coal and other industries?—No.

19,748. Is there not this difference, that you cannot reproduce coal, but from raw materials you can produce ships and locomotives and wagons and houses? Is that not a difference?—There is, no doubt, a technical difference; but in regard to the application of labour and capital to develop anything, it requires not only initiative but skill and energy. The earth itself is no use until, of course, it is tilled and cultivated. Coal is no use until you get it out of the mines. Steel is no use unless you put it into the house or into the ship. It all depends on the labour and capital which are employed and the way it is done as to whether it is to be productive or not. Therefore I think that whether you regard land and coal as a different class of commodity to, we will say, steel and bricks, to me it is the useful purpose to which those things are placed eventually that creates them of value to the community.

19,749. I want to put it to you that if you put steel into ships, and then send them to the bottom of the ocean you can reproduce steel and build new ships, but you cannot reproduce coal if it is exhausted. You recognise the difference, surely?—I recognise that there is a limitation of coal; so there

is a limitation of steel. You have in the earth so many million tons of ironstone; you have so many million tons of coal; you want them both preserved if you are going to utilise those commodities to the best advantage of the community.

19,750. Now you say the onus of proof as to whether or not the mines should be nationalised rests on those who propose nationalisation. Why should you say that? Why should it not rest on those who hold the mines and who are opposing nationalisation?—Because those who are holding the mines and who are opposing nationalisation have proved that under the system of private enterprise the country has advanced in every direction during the last 100 years in a way which must satisfy one that the system of private enterprise is one which can be accepted and further developed with advantage to the community, and if you are going to change it the onus of proof ought to be on those who advocate the change and not on those who believe that the system is a good one, even if it may be subject to improvements.

19,751. You believe that the mining industry has been carried on almost as efficiently as it is possible to carry it on. That is your opinion?—I admit there are a few exceptions.

19,752. You admit there are some exceptions?—Yes.

19,753. I think you take up the position that the mere workers in the mining industry are not entitled to any effective voice in management either on the theoretical side or the commercial side of the business?—I do not think they are entitled to it.

19,754. Might I put it to you that it may be that it is your long life in commercialism, your birth and training, which may have impressed that on your memory, and not the justice of the thing?—No. I think the fact that you guarantee a minimum standard wage which is to be based on the minimum standard to be fixed by the Industrial Council, which is our proposal, does secure a position of advantage to the workmen in the first instance.

19,755. You are dealing with the efficiency with which the mines have been carried on. I want to put it to you that in the past the mine workers have been told by the owners of the mine that they have absolutely no business with the commercial side or the theoretical side of the movement at all. Their business was merely to go down and produce coal and secure a certain amount at the end of a fortnight, but that they had nothing to do with the profits, with how the concern was carried on—I mean in the past. Do you think that is satisfactory?—Yes. I think it is the only system that will succeed. If I may say this: I am not averse to the men running a mine on their own or of securing directors on the Board if they like to take their share with other shareholders in the commercial success of a concern. I am not opposed to that.

19,756. I want to put it to you that they have a far bigger share in the concern than the people who merely put in, say, £2,000. They have their lives in it. You have never recognised that?—Yes, I have; I have recognised it to the full.

19,757. How can you capitalise the life of the miner?—You cannot compare the life of a person with money.

19,758. As a matter of fact, you do?—No, I do not, excuse me.

19,759. Yes, as a matter of fact, you do?—I have not done it.

19,760. Yes, you do. Parliament has fixed in the interests of the capitalists of this country the sum of £300 as the limit that a widow can secure by the death of her husband. That is surely capitalising the life of a workman?—That is no doubt with a view to enable those who have been dependent on the individual to be able to continue to exist decently, but at the same time it does not make good to the widow or the orphan children the loss of the bread-winner. The money does not.

19,761. Do you not see that for a widow with three or four children, say, £300, bringing in £15 a year, is a totally insufficient sum to keep her and her family?—Quite so, if you put it in that way; but

20 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

then the State apparently when it arrived at the £300 did it on different lines.

19,762. It did it on the lines laid down by the capitalist class who wanted to protect themselves against paying more; but the workmen who ought to have a voice in it have never been satisfied that £300 was all that their lives ought to be put at?—My reply is that it was done by the people's representatives in the House of Commons, and the representation is pretty broad. When this £300 limit was placed in the Statute it was not done by the capitalist class; it was done by the representatives of the people.

19,763. It is nice to hide one's self behind the House of Commons. I put it to you that the employer class moved heaven and earth to get it fixed at that or a less sum. I put it to you that the mine workers ought to have an equal voice in the working of the mine with the persons who merely put their capital in and not their lives?—I say the system would break down hopelessly if you are going to have divided councils on questions connected with the saving of life in collieries.

19,764. I was dealing with the industry on its commercial side as well as on its technical side. We may agree on how the management should be carried on, which is a most important question; but one of your difficulties which you cannot get over, and evidently it is a difficulty with many of the other employers, is that under State ownership, the State would not be prepared to pay the salaries which would secure the best men. I think that is one of the difficulties you put forward?—I am afraid it would be very difficult to secure under any system of State management the payment of salaries which is necessarily going to secure the best men.

19,765. You know there is a strong feeling that exists amongst the managers—that is the managers who do the real work of the mine—the second class and first class certificated men—that in many instances young and inexperienced men are placed in the position of agents over the managers and under managers, not because of their ability, but because of the fact that they are close relatives of some big shareholder in the concern. Have you ever heard of any complaint of that kind?—No complaint has reached me of that kind, and I should not think it very possible, because it is the employer's interest always under private management to secure the best agents possible.

19,766. The miners' agents know pretty well about this thing, and we know the ins and outs of it; we have talked it over, and we can point to many instances where the managers are right in their complaint that the person employed at a very high salary has less experience, less skill and less knowledge of the industry than the man who holds a certificate under him. Could you call to mind a case of that kind?—Nothing has come within my own knowledge.

19,767. Do you say that every person who becomes ultimately a mine manager, whether as a head agent or under manager, must have had experience—I think you say long experience of mines?—Under the Home Office Regulation I think he must have been five years working in a mine and going into a mine before he can become certificated. Then he has to pass his examinations as well.

19,768. Have you not forgotten perhaps some of the arrangements? If he holds a diploma he does not require to have had five years' practical experience, but it is reduced very considerably then?—He cannot be put in under the age, I think, of 25, by the Regulations, and most men who are taking up mining begin their mining work as soon as they have left school.

19,769. Are you aware that the clause which made it necessary that a person should have personal experience as a worker underground before he takes a first class or a second class certificate was put in at the instance of the miners?—I think it is a very good provision.

19,770. Do you know that it was opposed by the employers?—It is quite possible that some employers might have opposed it.

19,771. Do you know that it was put in there because miners with long experience behind them

found that inefficient persons were put in at the head of the management?—Then it was quite right to put it in.

19,772. You would not say that the private ownership of mines deserved the credit of something that the miners themselves forced on the Government?—I think when Government is legislating it is bound to take into consideration anything that anyone can say, whether it comes from the mine owners or from the workmen or from the consuming public. It is bound to take every view and to try and make as perfect a proposal as they can.

19,773. You are endeavouring to make out a case to-day to this Commission and to the public outside that it would be wrong to nationalise the mines, and you give one reason which is a very important reason, that the mining industry has been carried on efficiently by the present and past owners as far as safety is concerned and as far as the commercial side of the business is concerned. You are making that claim to the public outside in this Commission. If I put it to you that the mine owners generally speaking have no right to claim any merit for the improvements so far as safety is concerned, but that those improvements have been forced on them, would you not be dishonest in making that claim?—I think that the miners' experience is of value, but I think that the mine managers, who are experts and who are specially trained in connection with safety, have done all that human beings could do to really improve the safe conduct of the mines.

19,774. While it might be said that the mine managers of this country and the skilled men amongst the directors have done a great deal for the progress of the mining industry and the efficiency of the mining industry, I want to put it to you that the vast majority of the shareholders and directors have neither the skill nor the time to do anything for the progress of the industry—that it has not been, generally speaking, the people who have had their money invested, but the paid servants who deserve the credit?—The shareholders are, no doubt, a body of public people who have put their savings into these concerns. As a rule, they are poor people; many of them are past the age of doing very much work. Many of them are widows, and so on and so on. It is quite impossible that those people should have minute knowledge of mining and the industry as a whole; but I have yet to learn that the directors of large companies—I do not know many small ones—are incompetent to carry on the industry in the interests of the shareholders and in the interests of the people they employ.

19,775. They have no duty to carry on at all. It is the manager who carries on the mine and the manager of the commercial side who carries on the commercial side. The directors have nothing to do with it?—The Managing Director has very close touch with both, and the Managing Director is controlled by his colleagues on the Board.

19,776. Do you say to-day on oath that there are many shareholders in the coal trade who are poor people?—I have looked at our own register, and I came to the conclusion that a very large number are poor people.

19,777. Would you put it that in the main they are?—Speaking generally, if a company has 5,000 shareholders, I should think probably 3,000 of them were people with incomes under £500 or £600 a year.

19,778. But you could not make up at all the share capital by saying that in the main the money is the money of poor people, because there might amongst 50 shareholders be 25 who are poor people? They might only hold 1/50th part of the shares?—That is quite true. The bulk of the money value is in a few hands.

19,779. There are only 37,000 shareholders altogether?—In the colliery companies of this country?

19,780. Yes—so I am informed. But, of course, the shareholders may be the same shareholders in 10 or 12 different concerns. You know that that is so?—Quite so.

19,781. Now I want to take you to another important point, because if you can prove that the State would refuse to pay a salary that was adequate

20 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

to secure the best men, then the nationalisation of mines might not be the success that it otherwise would be. I think you have a return before you that was asked for by this Commission of some salaries paid to mine managers in this country. It was pointed out by a previous witness that the Government would not be likely to pay a salary that would attract the best people, and when it was pointed out by somebody else that salaries were not very high in mining districts, we asked for a return. I should like to call your attention to the managers holding first-class certificates. This is a preliminary return made from a return of 160 colliery concerns, or 45 per cent. of the whole, for the year 1913. The 610 colliery concerns will represent a far larger number, of course, than 610 pits or managers. For the year 1913, holding first-class certificates, there were seven at £100 or under £100, 241 at £200 or under £200.

Chairman: Up to and including £200 there are 241 out of the total of 610, and then out of those 241 70 have free coal and 149 have house and coal.

19,782. *Mr. Robert Smillie:* Yes—of the seven that have £100 and under a year, two have free coal and one has a free house and coal. Of the 241 of £200 and up to £200, 70 have free coal and 140 free house and coal. Then there are 311 at £300 or under £300 a year, 135 at £400 or under £400, 69 at £500, and so on. That is the first-class certificate men. The number of men employed in the collieries where they are serving unfortunately has not been secured, because it may be taken by people who do not know anything to the contrary that these are very small collieries. Then, with regard to the second-class men, strange to say, there are a smaller number of those with £100 or less; four have free coal, none have free house and coal. Then, 651 second-class certificated colliery managers have £200 a year or less; 79 have £300 or less, and five only have £400 a year. That was prior to the war. Now we will take the year 1919—I do not know how late in the year this is, but this is the same class of people. The number at £100 a year or less has fallen from seven to three. Might I call your attention to this, that under this return there are still three colliery managers holding first-class certificates at £100 or under a year, which it may be taken would be about £50 a year now. There are 12 at £200 a year first-class certificated men, which may be taken to be £100 a year; 127 at £300 a year; 379 at £400 a year; 230 at £500 a year. I need not tell you that the majority of those men probably have worked their way from the ranks of the mine workers; but I think you will agree that it has taken them a terrible struggle to secure their certificates by examination. Now, I would ask you, do you think if the mines were nationalised that the Government would pay such salaries as I have read out to you to men into whose hands every morning or at some time during the 24 hours is placed the lives of 800,000 underground workers? Do you think that the Government, if the mines were nationalised, would produce the coal under a system of payment of this kind to certificated colliery managers?—I should think that the salaries would be graded in the same way that the salaries are graded in every Government department after long conferences with the Treasury. Whether those salaries and whether the certificates would be at all similar to these is a matter entirely unknown to me. I cannot put myself into the situation as to what would be the decision arrived at after going into the whole question of the revision of salaries by a Government department.

19,783. Do you think that £100 a year in 1919 is an adequate salary for a person who is in charge of a mine and holding a first-class certificate?—Not if he is a competent man.

19,784. Surely if he was not a competent man you would not have him there?—He ought not to be there.

19,785. Do you think that £200 is an adequate salary for those 12 men holding a first-class certificate and having charge of and the responsibility of a mine?—Speaking generally, I think that a salary of £400 to £500 a year, which is the salary at which

most of these men are employed, is a fair payment for the work which they are called upon to do at the present moment. Of course they have other things besides what is mentioned here.

19,786. In some cases they may have free coal and house, and there may be a bonus in some cases?—In most cases I expect there is a bonus.

19,787. I think you agree that salaries less than what are indicated here you would not think sufficient for men in charge of responsible work. Could you conceive of the Government paying a competent colliery manager who held a first-class certificate £100 a year at the present time for managing a mine?—No.

19,788. Do you think that if such a thing was in existence in a Government department, if the mine were owned by the State, that the question would be raised in the House of Commons?—It would.

19,789. And effectively raised?—I believe so.

19,790. Then that to some extent would vitiate your evidence that in the hands of private owners efficient men would get a higher salary than they would be likely to get from the State?—You see the whole system would be quite different. The Government has to take a person in a position of this kind within certain ages. The question of age does not come in at all in connection with private enterprise. I do not say what these three individuals are, but there may be some special circumstances which I have no knowledge of which have influenced a private concern. I might or might not approve of a salary of that kind even if I knew the circumstances; but the circumstances are entirely different under a system of private ownership than the system of the routine-regulated character which exists under the State.

19,791. Would it be necessary that all the present conditions applicable to State servants should apply? Would that not be a matter for agreement under the Act of Parliament as to whether pensions and everything that now applies to Civil Servants should apply to State-owned mines?—I see enormous difficulties in having a system in which Civil Servants, who are called upon to perform the same duties, are going to receive variations in salaries. That is one of the great difficulties in connection with Government departments. The men who do the same duties are all paid alike. They are all placed in the same category and work the same hours.

19,792. You base your results on page 5 of an estimated reduction in output?—Yes.

19,793. You say an increase in cost of production will raise the price of coal to the consumer at home, and for export?—I believe that will be the result of nationalisation.

19,794. Can you give any reason to justify your statement, which of course cannot at the moment have any adequate proof? I am referring to your statement that the price of coal would be raised as the result of nationalisation?—You cannot, in my judgment, control efficiently a large number of Civil Servants unless you have considerable supervision and considerable inspection. Both those items can be dispensed with under a system of private ownership. You are going, therefore, to increase the number of officials, in my judgment, enormously, in connection with the establishments which are going to be under Government control, and that alone would result at once in increasing the cost of production, and the only way of being able to meet that increased cost of production would be to increase the price of the commodity required by the consumer.

19,795. Have you known cases in which the amalgamation of a large number of large collieries has been urged and carried through, but where it has been urged on the ground that it would reduce very considerably the expenditure?—There is no doubt an advantage to be secured by amalgamating a certain number of collieries, but I am sure there is no advantage in economy to be secured by amalgamating too many. Directly you get loss of touch between the directors and the heads of Departments, and the heads of Departments and the men who are responsible for carrying on the industry as a whole with one united policy, you get a reduction in efficiency.

(Adjourned for a short time.)

20 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

19,796. *Mr. Robert Smillie:* On page 12 of your *précis* you deal with the distribution of coal to local consumers and industrial centres and in towns generally?—The point I tried to make in my evidence-in-chief was this, that in normal times the household consumption I place at only between 12 and 13 per cent. of the total output. The distribution of household coal in my own experience is not a thing which is dealt with very frequently between the colliery owner and the consumer. In the North of England we supply to the railway companies as a rule trucks of coal which are placed in what we call depots, and there the local consumers come to the agent or the stationmaster and make their own arrangements in regard to securing that coal. The coal is ordered from the colliery. It is sent in trucks to the railway station, and after that we are no longer responsible for its distribution.

19,797. There are many cases in which the colliery owners are also the distributors in the sense that they have depots in the big cities to which they send the coal, and in which they distribute?—What occurs is this in the North of England: We apply to the railway company for cells. The railway company, if they have got cells to dispose of, or if the cells are on the property of somebody else, are allocated to the different coal producing firms very largely in accordance with the demand made by the local population for a particular class of coal. If the sales at that particular cell are not up to an average, then the cell is closed to that colliery and handed over to some other applicant. In that way there is created a sort of competition between the colliery owners to meet the genuine demand of the consumers in any particular given place.

19,798. This enquiry, while dealing primarily with the producers of coal and with the mine and royalty owners, also has before it the question of the distribution of coal. Only a small percentage of the total coal produced is used for domestic or household purposes, as you bring out in your *précis*, but that is a very important part of the trade. I think you will agree with me that if the local consumer—the domestic consumer—is not protected, there may be a very great evil caused by the distributors of coal coming between the producer and the household consumer?—I have no experience, and I have no definite information, which enables me to state positively that an evil exists. I am surprised at the difference between the colliery prices and the price which small consumers have to pay for their coal in the towns and cities of this country, but with regard to the circumstances which lead up to that I am not sufficiently cognisant to be able to say that there is a real evil. The merchants may find it necessary to hire horses and wagons and pay sufficient wages which in a system of distribution reaches these large differences which exist between the pit price and the consuming price, but I am not really very conversant with the distribution after the coal is sent to the railway stations.

19,799. I suppose that you, like the consumer, wonder why it is that the pit bank price may be 20s. a ton and the coal delivered to the consumer, either in hundredweights, or less quantities, or in tons, may be £2 5s., while the railway carriage may be only for the moment 6s. or 9s. a ton. But as the outcome of that, you say, if any grievance exists, there is no reason why the municipality or some other authority ought not to undertake the distribution of the coal by buying direct from the collieries and selling direct to the consumer. I think you hint at that in your *précis*?—I said the responsibility, I thought, rested upon the local authority and the consumers, and I thought the evil ought to be met, if it exists, by co-operation on the part of the consumers. I should much sooner see established in the towns a co-operative system for purchasing and distributing than I would hand it over to a large body of municipal officials.

19,800. Are you as much afraid of a local authority or municipality as you are of the Government?—I think that departmentalism comes in even in municipal bodies, but I will not say to the same inelastic extent as it does in large Government Depart-

ments. I was 9 years upon a corporation, and so I know pretty well the systems upon which corporations are carried on, and that is my opinion: that you are obliged to have certain rigid, definite routine and discipline, which is quite different in well-managed municipal bodies to that which exists under a system of private enterprise.

19,801. I suppose you would not condemn the great municipal authorities of our great cities in regard to their tram services and electric services, and say they are being worse managed and carried on than they would be under private enterprise?—I think it is very difficult to generalise on a system of municipalising any given commodity which is required by consumers until you get to know the whole of the circumstances. I suppose you know the case of the manager of the Glasgow Tramways who went to Chicago with a view of giving advice as to the best way in which the tramways of Chicago ought to be municipalised, and he came back still believing in the municipalisation of the tramways of Glasgow, but he was persuaded that under the given circumstances of Chicago it was quite impossible to municipalise them to advantage and to destroy the private enterprise system which prevailed there for the benefit of Chicago. I am only giving that as an instance. Until I know the circumstances of each place, I do not know whether it would be worth while to municipalise the trams or 'buses or any of these utility services which are so much required by the people.

19,802. But you do go the length of suggesting in your evidence that it might be a good thing for the consumers through some co-operative action?—Yes, I believe in co-operation.

19,803. That is to say, to distribute coal supplies?—Yes.

19,804. Would you be prepared to advocate that the same thing should be done with regard to other supplies, such as the food supply or milk supply and other things?—Well, I think that there is a great deal which ought to have been done and which has not been done in this country in connection with co-operative supply and milk distribution.

19,805. You are getting on rather dangerous and slippery ground if you are prepared to admit that the middleman in any industry ought to be replaced by co-operative work, are you not? Are you prepared to take the plunge to that extent?—If you think it is slippery, I think I can draw the line very distinctly in my own mind.

19,806. You, and those whom you represent, are anxious, I think, that the control of the coal trade should be got rid of at the earliest possible moment?—Yes.

19,807. You think that control has not been a good thing?—I think that there are many points in which it might have been improved. I do not say it could have been avoided during the special circumstances of the war, but I have seen very detrimental effects as the result of control in connection with the distribution of coal under the Government control system.

19,808. I daresay perhaps difficulties would have arisen even under private ownership or without Government control, because of the enormously changed circumstances caused by the war?—Yes.

19,809. I mean private producers of coal would have found great difficulties because of the new circumstances?—They were abnormal.

19,810. Do you know whether or not the colliery owners, generally speaking, gave the fullest assistance they could to the Coal Controller in carrying on his difficult task?—I understand that they have. Certainly in our district we have had no difficulty in working with the representative of the Coal Controller.

19,811. You cannot speak for the general body of the colliery owners?—No. I know the system which existed in the North of England, but I cannot speak exactly for what has occurred in other parts.

19,812. Are you aware, generally speaking, that they were anxious to avoid control in the beginning?—I think we were all anxious to avoid control, because the moment you have control set up you lose that personal touch with your customer which is

20 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

essential to giving satisfaction either to the consumer or the producer.

19,813. You do not go the length of saying that at no period or under any circumstances should the Government or a Government Department interfere with the coal industry?—I think the interference of Government ought to be rather by regulations such as those under the various Mining Acts rather than by control. I believe in regulation, and I believe in inspection, but I do not believe in the Government dictating to private firms where they are to send their coals, and how they are to send them, and when they are to send them. If you do, you get nothing but discontent and dissatisfaction and increased cost to the consumer.

19,814. Even during the war you would agree that such regulations became necessary for the time being, would you not?—Yes. I cannot say something of the sort was not necessary.

19,815. Did you object to or did you approve the action of the Government in carrying through the Limitation of Coal Prices Act?—No, I did not take part in any controversy, if controversy existed at the time.

19,816. Do you think now, looking back on the thing, that it was necessary something should be done to protect the consumer against prices soaring up?—So far as my knowledge is concerned, I think it was possible and conceivable, if the mine owners and the public generally had been taken a little more into the Government confidence, to have avoided it. That is my own impression. But I have been engaged for a certain part of the war abroad, and I never ventured to express an opinion as to whether those Acts of Parliament which limited the power of producers and consumers were really essential. I accepted them whole-heartedly with the view of trying to make them as workable as I could.

19,817. You have become aware that three mine owners and three miners were on the Committee of seven that suggested that there should be an effort made to fix the price of coal to prevent the price soaring up to a height at which people could not get it?—Yes, and my criticism is that the Government did not sufficiently take the people of this country into their confidence, but under the circumstances I have no doubt it was necessary for that Committee to work and carry on the regulations and the control which they thought essential.

19,818. I will not quarrel with you at all, however much you abuse the Government, only I think it is only fair to say that the Government was faced with very abnormal circumstances and did its best so far as it could conceive under the circumstances?—I quite accept it; it was a most difficult problem.

19,819. One of the difficulties of nationalisation would be the dividing up of the different interests in coal by-product plants and iron and steel works, and probably you would have to go the length of the shipbuilding works and the steelworks in producing plates, because they are now, as you pointed out, all very closely allied and run generally by the same people. Now I want to put it to you—Has there not been a very large amount of money earned in profits in the coal trade which has been put into the erection of coke ovens and into by-product plants?—I think, on the other hand, there has been more money made out of other industries put into the development of the collieries during recent periods than there has been in the other direction which you suggest.

19,820. Take the period of the war: Has there not been a very large amount of money which was earned in the coal trade put into development in other directions?—Yes. It works in this kind of way: If you have a reserve fund accumulated for depreciation purposes from the collieries over a term of years, you utilise a fund of that kind to erect a series of by-product coke ovens. I suppose each oven to-day would cost £5,000 and the last ones which were completed cost about £2,500 apiece. That money may originally have come out of the coal trade, but it is with a view of redeeming the capital which was put into the colliery; that has been diverted by the directorate into by-product plant

which in turn returns a big revenue to the industry as a whole, and that money replaces the redemption money which was standing to the credit of the firm before development and expenditure took place. Exactly the same sort of process has gone on in connection with opening up new winnings by driving drifts through stone and developing royalties underground which otherwise would not have been developed.

19,821. Did Pease & Partners allow the Germans to put down ovens and extract by-products from coal at any of their collieries?—On the other hand, we were the first people to put up those ovens ourselves. We have worked them ever since 1882.

19,822. Your 1882 ovens were rather different things from the latest?—Yes, there has been steady improvement, I am glad to say.

19,823. Do you know of any cases in Durham in which the Germans erected the ovens and extracted the by-products, getting the coal from the colliery, and sold the coke to the colliery owner and sent the by-products to Germany?—I know the type of coke oven has a very German sound, but the patent is the result no doubt of experience obtained in Germany. We have put down that type of oven in our country, but I do not know of anyone in the County of Durham or any company in the County of Durham who has put down these ovens which are German in origin.

19,824. And under German control?—I do not know of any; I do not say there are not.

19,825. Have you heard of any being put down in Great Britain?—I saw that some witness before this Commission stated that he had heard of it, and therefore I accept that statement; but to my knowledge I do not know of any.

19,826. Had you ever heard of that before the witness said so?—I cannot recall having heard of it.

19,827. You do not think there has been any unnecessary loss of coal in barriers, or by the throwing back of small coal, which would have been prevented under nationalisation or State ownership of the the minerals?—I think there would have been just as many errors under State control in connection with leaving coal underground as there have been under private enterprise. The great difficulty often, you know, in leaving coal is to know whether to bring it to the surface and dump it, or to leave it unworked underground. You may have a seam which is producing nothing but small, and at the moment there is no way of getting rid of that small coal. I think the State would have been just as neglectful of some of the small coal in the past and left certain coal of that quality and in certain situations unworked as certainly has occurred under private enterprise.

19,828. Some of us here feel delighted to know that the mine owners and royalty owners have been such good friends and have got on so well together, but I want to put it to you that it is possible that a mine owner may lose the coal belonging to one, two, or three owners of coal around the coal of a landlord in the centre, and may make it impossible that he can lease his coal unless to a company that is prepared to sink on his estate. Have you ever known that being done?—Yes, I have, and it is one of those things which I have strongly objected to, and it is one I think the State ought to have taken up years ago. As I say in my evidence, the very first thing I did was to introduce a Bill to get rid of that sort of thing. I have a case of iron-stone in my mind and a position of that kind where we were compelled to sink in the wrong place.

19,829. There may be an estate which may have under the surface very valuable seams, but it may be really too small to justify sinking on that?—Quite so.

19,830. You say you are satisfied with the Report of the Acquisition of Lands Committee which dealt with that matter?—It seems to me that they have recommended the creation of a tribunal which ought to do justice between man and man and at the same time secure that the minerals should be worked to the best advantage of the country.

19,831. Would it not require legislation to secure the adoption of that Report if it is finally adopted by the Government? If the Government adopts the

20 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

Report would it not require legislation finally to give effect to it? I am afraid it would. I wish it could be done under an Order in Council, but so far as I know, it would require legislation.

19,832. Do you think the mineral owners will be prepared to accept legislation interfering with their rights?—I think a certain number of them would not very readily accept the proposals, but I feel confident that in the present day, with the mining interest entirely in favour of a sanctioning authority to be set up and supported, as I hope it may be, by the general feeling in the whole community, any objection on the part of the land owners would disappear and would not prevent any legislation of that kind being carried through.

19,833. When you say "mining interest," have you only the mine owners' interest in your mind?—No, I was thinking of the miners as well.

19,834. Have you read the evidence of some of the Dukes and Lords who gave evidence here on the question?—I heard the Duke of Northumberland's evidence given here.

19,835. Did you hear it here?—Yes.

19,836-7. Do you remember that he said he was prepared to fight, inside and outside the House of Lords, to prevent any interference with his interests?—He did not give me that impression.

19,838. He does object, I think, to any interference with his rights?—I do not know whether he went so far as to say that, but I imagine it would be his feeling that if the interference with his rights was for the general advantage of the nation he would accept an alteration of the system provided he got compensation for any loss which was incurred as the result of that legislation.

19,839. Did he not really in reply to a question say that supposing it was felt necessary by the Government to bring in a Bill to nationalise the mineral royalties he would be prepared to fight it?—I think he did use words to that effect.

19,840. Do not the proposals of the Land Acquisition Committee interfere with the rights of landlords?—Yes, but I think it would only do so when the interest of the nation might justify it.

19,841. If you can show that to any extent at all you are justified in interfering with what the Duke of Northumberland, and Earl Durham, and the Marquis of Bute, and others claim to be their land and minerals, have not we the same right to interfere up to the fullest extent in taking them from them?—Not unless you can prove that the general community would be benefited by the interference.

19,842. Certainly. I take it for granted you must be able to prove that first. On the question of the poorer collieries you admit there are some which might under private ownership of the mines require to shut down?—Yes, I think there are some almost in every district in certain periods.

19,843. May I put it to you as a pretty extensive mine owner, that under the Conciliation Boards by which wages are regulated in the various districts, the tendency of the general wages is to fall down to the ability of the worst situated mine to pay them?—No, I think not. I think you have to take the economic worth of the whole industry in order to ascertain under a well-organised system what is the rate of wages which can be afforded and it is not paid or based on an isolated bad case.

19,844. The proposition is so plain that I must be putting it very poorly to you. You are under a Conciliation Board agreement in the six, seven, eight or ten districts of Great Britain by which miners' wages are regulated according to the realised value of coal, and the industry could only pay certain wages fixed on the realised value of coal. Do you say, when wages were fixed on the realised value of coal at a certain point and that the worst situated collieries could not pay those wages, they do not require either to pay the wages or stop?—Yes.

19,845. That being so, must not the wages under any system of that kind be fixed at a point which will enable the worst situated colliery to go on and pay the wages?—No, because what happens is, if you close the colliery or seam, or part of a seam, or

district in a mine, you are diverting your labour from that district into some other which can be more economically worked. That generally occurs.

19,846. Do you know your reply has nothing to do with my question at the moment?—No, I thought it was pertinent.

19,847. I beg your pardon! I cannot be putting it very clearly to you, or I am sure you would not reply in that way. If a colliery finds it is not able to pay the wages, it must shut down. If it is not able to pay the wages without losing money it might continue to pay the wages for a time and go on losing money, but it will ultimately require to shut down?—I agree.

19,848. Now collieries in the same district may be so well situated that they are able to pay the wages and pretty high wages. I venture to say that if the wages are fixed at a higher point than the worst situated colliery can pay, it must either pay out of capital or lose money, or shut down?—I agree with that proposition.

19,849. That is what I was trying to put, and it was my stupidity that I did not put it more clearly. You would disagree with every other witness who says it was possible for the worst colliery to go on and pay wages at the fixed price? In the last three pages of your *précis* you present what I think is the mine-owners' view upon the matter, and what they think should take place if the present system is to be altered?—This is a way in which we think that all the advantages of private enterprise may be maintained, which we think essential to the industry, and at the same time, a way of meeting any criticism which can be brought against the evils which are attached to a private enterprise system such as has been in operation during the last few years.

19,850. You say you are speaking on behalf of the colliery owners and with their authority when you say that, if there is any interference or attempt made to joint control of the mines, they would prefer seeing the mines nationalised, as they are not prepared to agree, as private owners, with joint control?—Yes; my words are on record.

19,851. Were you authorised to say that on their behalf?—Yes.

19,852. You are aware that a majority of this Commission have decided, or a number of this Commission previously decided, in favour of nationalisation, and a number have decided that the present system stands condemned and that some other system must take its place, and you are authorised on behalf of the owners to say that, if there is anything in the shape of joint control or managership of the mines, they will not carry them on, but they must be taken over by the State?—When you say joint control or joint management, if it means the direction underground or even the carrying on of the commercial affairs by the Board, I say that, as self-respecting men who understand the trade, we cannot conscientiously undertake to carry on the industry.

19,853. Then the employers do not propose to substitute anything for that but the setting up of what may be a Joint Advisory Committee or Conciliation Committee without any executive power?—That is so.

19,854. Either on the technical side or the commercial side or the management side?—That is so.

19,855. While they are prepared to allow the miners to advise, they are not prepared to give any executive power to them in any shape or form in the management of either the commercial side, or the technical side, or the safety side of the industry?—That is so, unless they have representatives on the directorate.

19,856. And you would prefer to hand the mines over to the State rather than carry them on under those circumstances?—Yes, because we regard such a system as absolutely unworkable.

19,857. *Mr. R. W. Cooper*: How long were you in the House of Commons?—From 1892 to 1916, with two intervals, one of two months and another of four or five months.

19,858. If my memory serves me correctly, you sat for the Tyneside Division of Northumberland?—I did, for a number of years.

19,859. And, I believe, you sat for a division of Yorkshire?—Yes, I sat for the Rotherham Division.

20 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

19,860. I think they are both industrial constituencies with a large element of miners?—Yes; certainly the large majority of my supporters were miners in both those constituencies, so far as I can judge.

19,861. I gather from your *précis* generally that your observation as to the County of Durham is that our system of Joint Committee work with the miners has been productive of good?—So far as my knowledge goes, it has been developing in the right direction throughout the whole period that I have been identified with collieries.

19,862. When I say "productive of good" I mean, of course, productive of the creation of a good feeling between the employers and miners?—Yes, I think we are perhaps peculiarly fortunate. We have always had friendly feelings between ourselves and our men, even when apparently certain individuals would like to have indicated that there was friction, and we have worked very amicably. On our Joint Committees we have worked extremely so and settled an enormous number of troublesome questions through those Joint Committees which have been established.

19,863. In your diagram you showed exactly the system of Committee work with regard to what I may call the purely business operations of ourselves and the miners. There is one important Committee I should like you to mention. You probably know that the Workmen's Compensation Act in Durham, unlike any other districts in England, is worked by a Joint Committee?—Yes.

19,864. And that Committee exists under an Order of the Secretary of State?—Yes.

19,865. An Order made under the express terms of the Workmen's Compensation Act?—Yes, that is so.

19,866. May I take it that that Committee, which has been in operation for 20 years, may be justly regarded as a successful Committee?—I think it has been extraordinarily successful, because it has avoided nearly all litigation in connection with questions such as disablements. I happen to have in my hand the Durham Colliery Owners' Mutual Protection Association Annual Report. I think it is marked "private and confidential," yet I can say it does indicate that the Arbitration Committee which was set up, and to which you allude, consisting of owners' and workmen's representatives, has sat on 12 occasions and disposed of 466 claims, and the number of claims against members of the Association which were decided by the County Court during the year were 17. I think that that is an indication that by friendly meeting with representatives of the men we are able to dispose of all these very difficult cases connected with deaths and disablement.

Mr. Herbert Smith: What year is this?

Mr. R. W. Cooper: This Joint Committee is a somewhat special Court invested with the powers of the County Court by order of the Secretary of State under Clause 16 of the Second Schedule of the Workmen's Compensation Act, and they have in fact all the powers of a County Court.

Chairman: Yes, it is a Workmen and Employers' Committee instead of the County Court.

Mr. R. W. Cooper: Yes. The Order applies to each of the Associations, the Miners' Association and the Colliery Owners' Association, and so on. There was the same Order made in each case.

Chairman: Durham is the only county with this Joint Committee, I think.

Mr. R. W. Cooper: Yes, or rather it is the only county which has taken advantage of the power given under the Act.

Mr. Robert Smillie: I think Cumberland has too.

Chairman: My book says only Durham, but it may be Cumberland as well.

19,867. *Mr. R. W. Cooper:* (To the Witness.) You think that our experience in Durham to which you and I belong is all in favour of Joint Committees and mutual discussion?—I do. If I may give one other illustration, we have had recently a very difficult situation to meet in connection with the demobilisation of men coming back from the front. We were very anxious to re-engage those men at once in the collieries, but we had not working-places for them

as they came back, and it was a question of who was to be turned away from our collieries to make room for these men. In most of our collieries we established Pit Committees, and these Pit Committees with our managers discussed who the individuals were who ought for the moment to be sacrificed to make vacancies for the men coming back from the front after demobilisation. That system has worked admirably. I just give it as an illustration of the cordial way in which the men and ourselves can work together to carry on the industry in a difficult emergency when it arises. I know there were one or two cases where men said they had not anything to do with the discharge of the pit men and would not work, but in most cases it worked very well.

Chairman: What is the number of this Committee? How many would be on each Committee?

Witness: Generally 5 on each side.

19,868. How were they elected by the men?—I think at their lodge meetings, but that is a point upon which I cannot speak positively.

19,869. They are really elected by the Miners' Federation?—Ours were elected by the managers and workmen.

19,870. You say they are elected by the lodges. Do you mean by the lodges of the Miners' Federation?—Yes, of the Miners' Union—the local trade union.

19,871. Not by the general body of workers?—No, it is the local organisation.

19,872. *Mr. Evan Williams:* (To the Witness.) One question with regard to the point Mr. Smillie put a question to you as to the standard being brought down to the level of the capacity of the poorest colliery. Do you know whether it is the fact that in Durham the poor collieries pay lower day wage rates or lower piecework rates?—No, they pay the county average.

19,873. In the case of a poor colliery not being able to pay, is the county average thereby altered?—No, the same system prevails throughout the county for a colliery whether it makes good profits, or both ends meet, or a loss. The same system prevails at every colliery, and in normal times, until we came under control, if a man was not able to work within 5 per cent. of the county average in his working-place, he appealed for an increase. On the other hand, if the employer found that an excessive wage could be earned by a man getting much more than the county average, he appealed for a decrease, and these cases were heard by the Joint Committees.

19,874. Although it may appear in theory to be the result, in practice it is not the fact that the poorest colliery tends to lower the standard of wage of the district?—In my experience it is not the fact.

19,875. *Mr. Herbert Smith:* I notice in your *précis* that you are interested in collieries in Yorkshire?—I have been interested in the Allerton Main Colliery for about 18 months.

19,876. Do you know the career of that colliery?—Not very well.

19,877. You know the career of that colliery very well?—Not very well.

19,878. It did not go begging in the market very long. It was soon sold when it was known it was to be sold?—It took us, I suppose, four or five months to negotiate terms and probably six or eight months before we came to a final agreement.

19,879. You had got some experience as to what it had been doing before?—The owner of the colliery answered any question we liked to ask in regard to output, cost, and matters of that kind.

19,880. Shall I be right in saying it had a good career?—I think there was a substantial profit made every year by our predecessors.

19,881. In your firm you have a tremendous lot of businesses belonging to Pease & Partners?—I do not know. We have several small businesses, such as briquette making and things of that kind. I have alluded to brick making in two or three different fields and chemical works, and things of that kind.

19,882. How many firms are you a director of?—They are mentioned in my *précis*.

20 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

19,883. Are there not more than there are mentioned there?—No.

19,884. Do I take it you are split up in sections. With regard to Pease and Partners, there are about 40 firms here. One was in Germany before the war that you are interested in?—I have no knowledge of that.

19,885. E. Lloyd Pease?—A first cousin once removed.

19,886. He had an interest in chemical works in Germany?—I do not know it.

19,887. Do you tell me you do not know where your money is?—That was not any of my money.

19,888. This is Pease and Partners?—Nothing to do with it.

19,889. It is under that name?—E. Lloyd Pease?

19,890. Yes, connected with the firm?—He is a director of Pease and Partners. Pease and Partners, to my knowledge and belief, has nothing to do with a German firm. I am not responsible for any interest which may be taken in a German or South African mine by any of my colleagues.

19,891. Pease and Partners' name is in many firms in this country? This is one out of this country?—I do not think that is true.

19,892. Let us see what profits you have been making. Do you give us Horden Colliery?—Yes.

19,893. You give us that as a serious proposition?—Yes.

19,893a. It did not do well, you say?—The three collieries at Horden when they were bought up had not done well.

19,894. They have done well since you have had them?—I am only interested very slightly. Pease and Partners with other colliery firms believed that the coalfield existed which the promoters of the Horden Colliery were anxious to develop, and when the public would not support the appeal for capital we went to their assistance and we subscribed so much in order to help them to develop the coalfield and establish their firm. Our holding is, I think, something like 500 shares in the concern.

19,895. It has paid dividends from 1911 to 1917 of about 10 per cent.?—I should think that is probably correct.

19,896. And added to its capital three-quarters of a million during that time?—It shows what private enterprise can do.

19,897. You quoted that to show us what big risks you are running?—There were enormous risks. There was no firm I ever heard of so nearly collapsing after they really took hold of it; the weight of water was so terrific with the sea coming into that colliery that nobody except men with this extraordinary enterprise would have gone on with the undertaking.

19,898. Look at the enterprise. Paid up capital, £973,915; debentures £300,000. Profits for six years, £45,485. That is in 1911. In 1912, £80,481; 1913, £169,520; 1914, £130,210; 1915, £86,131. That seems your worst year. Then, 1916, £183,505; 1917, £187,079. That is after you take in taxation and depreciation?—Can you tell me how many millions of pounds were paid in wages?

19,899. What I am looking at is this. This does not prove anything to me about payments in wages?—Are you not raising a question of prejudice because these profits are large? I want to point out if shareholders have been rewarded by getting dividends out of that concern the wage earners have probably received 8, 9 or 10 times the amount in wages, and then there is that benefit to the community. Private enterprise has accomplished this.

19,900. The point I want you to realise is that Durham miners were not paid as they ought to be paid to give you that profit?—How much can a Durham miner get at the moment?

19,901. I know what wages were or what was impressed upon Lord Mersey, and it was said you could not pay more than 5s. 6d. for coal hewers in Durham?—I have you not suggested the men are now getting 19s. a day?

19,902. No?—You say in your Report they get 14s. 3d. and 3s. war bonus. Since then they have had

another 2s. That makes 19s. a day, and if they work 250 days a year, surely they are not very badly paid.

19,903. Do not attempt to misquote us. We have given no figures. You owners put in figures showing what the Durham miners were getting. I think it was 14s. a day at that time?—In the Report signed by yourself, Mr. Herbert Smith, on the 20th March, on page 6, there occurs this statement: "Taking the average of the earnings of piece work coal getters in all districts in 1914 at 8s. 10d. per day and now at 14s. plus 3s. war wage"; that makes 17s., and you give those figures, and you know you have had 2s. more since. That is 19s. a day. Now you suggest this is not accurate.

19,904. That will not come off with me, Lord Gainford. That includes all districts. I put to you Durham coal owners put in an average wage over the coal hewer of under 14s. a day. Do not borrow from Yorkshire for any other county?—I am taking the average according to your statement.

19,905. I show the profits that have been made in Durham. I will show you some more which are more startling than these, which you are interested in. It is not your fear if there is nationalisation the country making a bad bargain; you fear losing a good business yourself?—My statements are on record. You need not believe me unless you like, but there it is.

19,906. Do you deny these figures?—I have no figures before me of the profits of Horden. I am not a director of Horden, and I cannot speak of Horden. As a director of a company that has a small interest in it I receive their annual reports. That is all I know about the profits.

19,907. Are you interested in Broomhill Colliery?—Yes.

19,908. Would you look at Broomhill and see if that has been a bad bargain? Paid up capital, £350,000 in 1914; debentures, £135,000. Profits from 1911 to 1916, £405,070; profits in 1915, £52,746. Profits in 1916, £89,764; profits in 1917, £95,385. Then there is a note at the bottom that appeared on your balance sheet that the pits had been working short time through lack of shipping facilities. I do not know what you would have made if you had worked all the way. That is not a bad bargain, either?—No; these are entirely due to the extra trade upon which this colliery entirely subsists, and when the Admiralty were able to allow facilities for ships to come into Amble Harbour we were able to get coal out at higher prices, and we made considerable profits. These profits, or a large proportion of them, are excess profits; and, owing to the war, they are not put into the pockets of the shareholders.

19,909. They were up to 1917. You did not do badly out of 1918?—Take the years from 1904 to 1912, there were only two years in the course of that period in which one shilling a ton was made.

19,910. This is after excess profits have been paid?—You must be fair. If you take abnormal times—

19,911. I am going to take your firm?—You take the abnormal part of the war with regard to profits secured by the export trade and the export prices not so much to Allies as to neutrals. Whenever we obtain those prices it is the Government that gets the benefit of the increase. If you go back to the history of Broomhill, it is a thing that colliery owners need not be proud of. One year we had 39d. profit for the whole of our operations; another 3-10d.; another 5-4d. in profits. A series of years have been lean, and for four years they never got a penny.

19,912. Am I right in saying you are interested in the Consett Iron and Coal Company, Limited?—Not one penny.

19,913. Your firm?—Pease & Partners have not a penny.

19,914. They appear in here as such?—That is not true.

Sir Arthur Duckham: What book is this you are reading from? You say: "They appear in here?"

Mr. Herbert Smith: I do not know that I am bound to supply you with it. He has a perfect right to say if these figures are not correct.

19,915. Sir Arthur Duckham: I appeal to the Chairman. I think we are entitled to know what book this is Mr. Herbert Smith is referring to?—I

20 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

am not aware that Pease & Partners have any interest in the Cossett Iron and Coal Company.

19,916. Have they an interest in the Cleveland Engineering Company?—Not a penny.

19,917. Now come to Thorne. Before we go to Thorne let me take you with regard to accidents. I notice on page 8 you refer to accidents. Are you right in saying that it is admitted there is a diminution of serious accidents?—Mr. Walker admitted it was not so?—I have certainly seen figures. I am not able at the moment to put my hands upon them, which show that there has been a gradual diminution in the number of deaths per thousand, and I thought also it equally applied to serious accidents unaccompanied by death.

19,918. If I tell you that in 1910 there were 59,042 accidents, that averages 336 a day for five days a week, and in 1913 177,189, what then?—Those are all accidents trifling as well as serious.

19,919. All accidents that last over seven days—nothing under seven days?—I do not for a moment discount the seriousness of accidents; far from it. It is the most awful part of coal mining.

19,920. You cannot very well?—I could not.

19,921. If you notice every 70 seconds a person is injured in coal mines, and it needs as much safety as possible?—I agree.

19,922. You talk about interfering with the management of mines when questions of safety arise. Have you had much practical experience with regard to safety?—No, I cannot say that I have. My only son is a mining engineer, and he had charge of three collieries. He used to come home and tell me all the details in connection with the working of a mine and how to try and prevent accidents and promote safety. It is that kind of experience I can claim; it is not because I am an expert myself in regard to underground appliances in connection with accidents.

19,923. Would you consider it as interfering with the management if the workmen were to inspect the mines under rule 16?—They have a right to inspect.

19,924. And make suggestions?—Yes.

19,925. And make reports?—Yes.

19,926. Does that interfere with the management of mines?—No.

19,927. Some managers object to it?—You will find awkward people amongst the miners sometimes.

19,928. Even in Durham?—I suppose so, and possibly in Yorkshire too.

19,929. And even in Yorkshire. I will give you some cases in Yorkshire and Durham too. I am dealing with Durham now. I shall be a Yorkshireman later on. Do you think a man would interfere with the management when he stops at the top and lets somebody else go down when there is danger? Is that interfering?—I mean the men's agent has left the manager at the top because he is afraid to go down?—It depends whether the man that went down was a more suitable man to go down at that particular moment.

19,930. I should think you would want the most suitable man you could find, but the man that went down had no certificate?—If he was unsuited he had better not go down.

19,931. Would you think that was interfering with the management when the man goes down the mine that has fired to fetch the men who are down there and the manager stops at the top?—No doubt he was the most suitable man for that work.

19,932. Are you aware there are scores of people who ask me to go to the mine to give them advice and I do not hold certificates?—I cannot say I know it.

19,933. You are giving a statement that if certain things happen they are going to clear out, and that is one of the questions?—If they cannot carry on a mine unless they can continue it under a system of discipline the mine becomes unworkable.

19,934. Has the Miners' Federation suggested any interference with discipline?—If you set up joint control, which means discussing every decision which has to be taken for the preservation of life, it becomes quite unworkable, and in the interests of the men it is a system which I should say no respectable self-respecting manager can accept.

19,935. Is that from your own experience?—My own experience is that you are suggesting that there

are difficulties when they do not actually occur. My own experience is if the men are working perfectly well the manager I think acts towards them in a humane and sensible way and you will receive from them exactly the same treatment and they do not want to interfere with the discipline.

19,936. Will you take this statement from me that the Miners' Federation does not want to interfere with the manager?—I am glad to hear it.

19,937. They do want to be able to advise as to some method of working that may save life and limb?—Anything that can be made in that direction of course ought to be made and to be received in the spirit in which it is made. Mr. Smillie in his Final Report of the Coal Conservation Committee advised the full control of mines and the production and commercial side. If it is to be fully controlled by the miners on the production side that to me conveys the idea that the miners are not going to be controlled by the certificated mines manager.

19,938. I want to put it again. Are you not trying to misquote? What Mr. Smillie puts is this, that we want some control; we want some say in the financial side of the business particularly if our wages are going to be based on the selling price?—This is what Mr. Smillie says on page 45. I certainly do not want to misquote him. "The mine workers, however, do not stop here. They want a Ministry of Mines, but they want more than this. They want the State to have the ownership and full control of the mines, not only on the production side but on the commercial side also."

19,939. "The State" that is right?—There you want as I understand to have absolute joint control with the State, do you not?

19,940. You misquote Mr. Smillie?—I am sorry if I did, but I now quote his words.

19,941. You said Mr. Smillie said that workers wanted full control?—I was certainly under the impression he said so. I am very glad I quoted his words so that I have remedied any misapprehension that may have existed upon that point. I have always understood the miners wanted joint control with the State. Am I incorrect in that?

19,942. We are asking for joint control but not joint control to interfere with the manager who is put there?—I am glad you make that clear.

19,943. We want to go further than you have suggested?—You want the miner to go on to the market and sell the coal.

19,944. No. What we want is if you are going to fix our wages by the selling price we want to know how we are being bargained away and whether the coal companies and the iron and steel companies are amalgamating. You meet a colliery owner one day and the next day he is an iron and steel director and the next day an iron director or a railway director, and the next day lime and sand owner. That is what is happening in Yorkshire to-day and in Durham too, and even in Pease and Partners. You are in the iron districts and you are in the lime and sand?—Yes, lime and sand.

19,945. Have we not arrived at the time when we ought to have some say at what price you shall sell it at?—No, I think not.

19,946. You think you have a perfect right to sell your coal at any price you like and then come and ask me to work at a pittance wage in Durham now like they did before the war?—I do not regard it as a pittance wage. I think our proposals, in which you are to get a wage based upon the price which is to be fixed by the Industrial Council and get a share in the profit and have an interest in the economic production, is likely to secure the best wage possible which can be got in the industry for the benefit of the miners.

19,947. Would you think it was interfering with the manager if the Committee said to the manager the best way is to work at retreating long wall instead of advancing where fires are breaking out?—I am quite prepared to hear all you have to say with regard to the different systems of working. The decision must rest with me after I have heard all you have to say as to which system should be adopted. There are inspectors appointed who have a right to

20 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

make representations, and they would make representations pretty quickly if a dangerous system were being adopted.

19,948. When you say, must be left with you, do I understand you to mean you want the management?—Yes.

19,949. Do you tell me that Pense and Partners leave it to their managers to work a pit in the way he thinks best?—Certainly, in connection with the system of getting the coal out. If we find that our man is not up-to-date or not adopting the most approved system of mining, we get rid of him pretty sharp.

19,950. Any suggestion that the men make has to be submitted to the directors?—No, the manager is left with a great deal of freedom as to how he works each place in his own district. He tells you all his prices and procedure, but he is the expert in connection with laying out the mine.

19,951. Would you agree with the witness before you, a well-known mining man, that we should have had more recreating long wall if it had not been for the expenses?—Are you alluding to Mr. Rhedes?

19,952. Yes?—I have not had very much experience of the Yorkshire system of mining by long wall.

19,953. He will tell you that?—I hope I shall gain some more experience.

19,954. You call that interfering with management if we said we thought that this was the best method of working the pit and will save life and limb?—Not if you say that. I do not think it could be interfering with the management. The manager would have to hear what you say, and he would have to take into consideration what should be done. I want a system to be established by which your view may be properly listened to, but the decision is to rest with the mine manager.

19,955. It has taken a number of years to convert you as far as you have gone?—It is only suggestions. We have conferences with our men, and we listen to what they say.

19,956. If they offered me £250 to go into a pit with some managers I would not go?—Perhaps there was a bit of tact lacking somewhere. There was some fault somewhere, perhaps on both sides.

19,957. I think there was. I wanted to tell them too much truth, and they did not want it?—Perhaps you said it in a way they did not like.

19,958. On page 12 you make a slight mistake where you put 21s. 2d. Ought it not to be 23s. 5d. before it left the pit?—If so, it is a misprint. I took the 21s. 2d. from the top of the page. It says: "The following table shows the various items of cost and profit on a ton of Derbyshire coal from its place underground to the time it reaches the consumer's cellar in London at 21s. 2d." I think that is in Mr. Justice Sankey's report.

19,959. *Chairman*: It goes on to say: "This 21s. 2d. is for coal as it comes from the pit. For household purposes it is screened to some extent, which makes the price of the best coal 23s. 5d. at the pit"?—I have gone on to say in my statement: "This is for the coal as it comes from the pit." I have put those words in quotation marks.

Chairman: Quite right.

19,960. *Mr. Herbert Smith*: You remember in 1893 there was that serious lock-out which took place when the coal owners locked the miners out?—Yes, I remember it very well.

19,961. Did you ever read that pamphlet which was published showing what Rickett, Smith & Company, coal merchants, made as a profit during those 16 weeks at their place in London?—I do not think I did.

19,962. Over £50,000 in 16 weeks?—I am not aware of it. I do not deny it; I have no knowledge of the fact.

19,963. We need not come to London. Suppose we go to Newcastle and find what is charged pit head at Newcastle, and what was doled out to the consumers there. Is it a fact that at Newcastle and Durham it has cost 12s. 6d. a ton to distribute?

19,964. I should have thought you would have gone into that question, living in that neighbourhood?—All we can do is to send our coal to a railway station

in these towns, and there it is left to reach the consumer by arrangements which may be made there.

19,965. I put it to you that a lot of collieries refuse to sell the coal direct to consumers?—I do not think my colliery firms have been charged with that. I can quite understand there are circumstances which justify the existence of a merchant who finds the customers for a colliery firm, and can give, being a local man, a better price than the owner perhaps would get, if he did not utilise the services of that merchant.

19,966. Is it not known to you that when the Coal Limitation Prices were put on—that is to say, 4s. a ton on pre-war—about 75 firms and colliery companies started to be coal merchants in various towns in England and Wales?—I do not know of it.

19,967. Durham does not do anything of that sort?—I do not know of it.

19,968. Do you think if I named a few you would know?—I am not going to say you are giving information that is not accurate.

19,969. Am I right in saying that coal companies' experience in by-products has been developed by research largely got from Germany which has been proved to be a financial success?—There have been, undoubtedly, chemical laboratory researches in Germany which have helped the by-product industry; but the by-product industry is not necessarily so simple as it appears from the facts which I think have been stated to this Commission. My firm have been always anxious to avoid losing the waste heat and to collect the gases from our old beehive coke ovens. We have gradually established, as far as we could, by-product coke ovens. Of course, they are very expensive to build; but what one is met with repeatedly is the difficulty of securing a market for these by-product articles. Tar, for a certain number of years, was practically a drug on the market. Sulphate of ammonia, when we put up our first ovens, was £12 a ton. When it dropped to £7 a ton, it no longer paid to make it. What the Germans did was to make a good number of experiments, not merely from the chemical side, but also in connection with the excessive heats, and the Germans helped us owing to their peculiar resources in connection with the bricks which stood the heat of these by-product ovens, and it was entirely on account of these bricks that they erected certain ovens which would have been erected earlier in this country if it had been possible. Our great difficulty has been, in connection with by-product works, to get the farmers to realise that sulphate of ammonia is a very valuable manure for the land. In Germany they had appreciated it, and it was on account of the success due to the sales of the sulphate of ammonia in Germany that the by-products were given an encouragement that did not occur in this country.

19,970. Is it right to say Germany learnt us many lessons in coal getting?—No; I think we have taught them as many as they have taught us.

19,971. Are there about 60 ovens in Britain which have been built by Germans?—They had experience in connection with bricks. The most important part in connection with these coke ovens is to secure a brick that will stand the excessive heat. If you have to go to Germany for the material, which we had to do on many occasions, to secure the right bricks that stand the heat, it is advisable to let the Germans make the bricks and make them responsible. The coke ovens we put up were put up by Germans in this way.

19,972. You are not telling us now that we went to Germany for the bricks. We made our bricks in Yorkshire?—I knew you did. We tried with your bricks alongside of the German bricks for a long time, and they would not stand the heats. Under private enterprise we have been improving the bricks all along, until we can make them ourselves now.

19,973. I see you say your firm has already spent a large amount of money in the process of freezing. Did we learn that from Germany?—I thought it was the Belgians who put down the first freezing apparatus. I thought the freezing had been put down first successfully in Belgium.

19,974. You are not right in saying this was the deepest mine that has been sunk?—It is the deepest

20 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

shaft in this country. There is coal worked at deeper levels, but I do not think from a shaft 940 yards deep.

19,975. Would you call it interfering with the management if the men suggested they could not work in an atmosphere hotter than about 70 degrees Fahrenheit?—Yes, if there is no way of reducing it.

19,976. Do not smile, Lord Gainford. Would you like to work in it?—I should not mind it much.

19,977. You would not mind it?—I do not mind working in heat.

19,978. When I tell you men have been made into old men at 50 years of age by working under these conditions there is nothing to smile at?—No.

19,979. There ought to be something done with regard to it?—Everything that is possible to make the conditions as favourable as possible ought to be done within reason.

19,980. Would you say everything has been done that has been possible in these deep mines with private enterprise to do it?—I think you will have got more out of private enterprise with regard to improving the conditions as a whole than you will get under any system of nationalisation that I can imagine.

19,981. If they can do it in France, and they have done it for years, and other countries, fixed a standard of heat that men can work under, what is there to prevent it here, except private enterprise fighting against it?—I do not know the circumstance of any case.

19,982. You know your Thorne pit will be subject to fires and other things?—Gob fires we shall have to try and avoid.

19,983. Would you call it interfering with the management if I said the safe way to work it was to go straight out to the boundary and back again?—If the manager said there is as safe a way doing it another way and he could justify his statement I should have to accept the decision of the mines manager rather than the decision of the expert miner who is not such an educated man.

19,984. Mr. Williams put a question whether you knew bad collieries pay less wages than good collieries. I think your reply was no. Did you ever know good collieries pay better wages than bad collieries?—I have known men earn more money at one colliery than another.

19,985. I want an answer?—I cannot recall any case. I cannot give you an illustration of that.

19,986. You have met in conference and you want a little pit committee set up?—I should like to meet men in conference.

19,987. To take your Thorne pit, if it works out as our other Doncaster coalfield instead of 5s. 6d. in Durham it will be 25s. there?—If we make a good profit I shall not grumble about the men getting good wages.

19,988. Are good wages being made in our Doncaster area?—The principal part of the profit goes to the State at present.

19,989. Now, come to the Workmen's Compensation Act. Do you know, when the Act went through in 1896, there were over 350 interested coal people having direct interests in coal pits who were members of Parliament?—I do not deny it.

19,990. And every clause in that Workmen's Compensation Act that coal interest fought all it could to make it as bad as it could and not as good as it could?—According to their own lights, they were doing their best in the interests of legislation and the State.

19,991. What is being said about our object in getting nationalisation and using Parliament, if we do use it we have learnt from you people?—I do not think that members of Parliament are justified at any time in promoting either their own interests or that of their pockets or of their class—they ought to promote the interests of their country.

19,992. If you people set the example and we take it, what then?—You are attributing a motive to a man because he votes in a particular way or because he happens to have an interest in a colliery. I suggest it is not a fair charge to make against 360 members of Parliament.

19,993. I make in intentionally. A Whip went round for a time to the coal-owners, saying he must be in his place as a division will take place to-morrow night on the Workmen's Compensation Act?—I still believe in the integrity of members of Parliament, and I know they are not going to be influenced by such Whips if the interests are against the interests of the country. I have a better opinion of human nature and human beings than you have.

19,994. With regard to the Workmen's Compensation Act. Mr. Cooper put very important questions, seeing you have an Order by the Secretary of State and you can make your own Orders as you think fit. Have you increased the Workmen's Compensation more than 25s.?—I cannot tell you what the results have been. I have not the figures. I have not looked into the comparison of the figures, and I cannot give you information on that point.

Mr. Cooper will tell you he could not take power under that Order to increase workmen's compensation in Durham.

Mr. R. W. Cooper: That is so. No power exists that would give us that power. That Order merely makes the Committee the tribunal to administer the Workmen's Compensation Act for the time being.

Mr. Herbert Smith: Am I right in saying they would have power under the Act to increase the compensation?

Chairman: All it does is this: that the Secretary of State may by Order, either unconditionally or subject to such conditions or modification as he may think fit, confer on any committee or representatives of the employers power to deal with it under the Order. You had better take a copy of the Order, Mr. Smith. It appears to substitute the Committee formed in that way for the County Court Judge.

19,995. Mr. Herbert Smith: There is nothing in this Order to prevent them increasing compensation?—I gave it as an illustration of how the men and the employers can work together in settling these matters to their satisfaction without going to the County Court Judge.

19,996. Of course, you have some cases that do go into Court?—Seventeen was the number that went into the County Court.

19,997. Some have gone to the Court of Appeal?

Chairman: Yes, they have.

Mr. Herbert Smith: During the last three or four years?

Mr. R. W. Cooper: Yes, as Mr. Smith says. As a matter of fact, the Committee have gone there once and stated a special case by consent, raising a point of law for the decision of the Court.

19,998. Sir Adam Nimmo: You were asked certain questions by Mr. Herbert Smith regarding the results of the Hordern Collieries, and also with regard to the Broomhill Collieries. Do you think it does any good to single out any individual firms with regard to their results?—In asking a witness like myself any questions, it is very obvious that one can only speak from one's own personal knowledge in connection with an undertaking in which one has been directly associated, and to that extent I think taking individual concerns is necessary, but I believe that the collieries such as Broomhill in Northumberland, and Peaso & Partners in South Durham, are more or less typical of our own district. What I say with regard to the management under the private enterprise system in those collieries applies really in principle to the rest of the United Kingdom.

19,999. I suppose you would agree that when you come to deal with the financial returns, you ought to deal with the financial returns of the whole neighbourhood, taking the average return of the whole industry?—If you want to get at the aggregate result with the view of coming to a definite decision on the whole industry.

20,000. I suppose you would agree that the financial return in the pre-war period and for a period of years was a very moderate return?—I think a very moderate return: it did not pay anything like a fair return for the risk of the money which was invested in such a speculative industry.

20 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued]

20,001. Mr. Herbert Smith put it to you, in connection with the question of joint control, whether the Miners' Federation had suggested any interference with the working of the mine. Of course, we have not had the scheme which has been definitely accepted by the Miners' Federation before us, but we have had Mr. Straker here, who gave us evidence on this point, have we not?—Yes.

20,002. Do you remember that he suggested that the Pit Committee would be the directors?—I gathered that that was so.

20,003. What would be the effect of that in your opinion?—It would be chaos.

20,004. Would it not be that there would be a great deal more than interference with the management of the mine?—It would mean not only that the men who were less competent would have a decision in connection with matters appertaining to the life and death of those who were at work, but it would mean that the whole property under a system of that kind might be destroyed.

20,005. I want to ask you again with regard to the effect of the poorer collieries on wages, because Mr. Smillie has made a good deal of this. I wonder if you are disposed to agree that he is wrong? He says that the wages position is really determined by the position of the poorest collieries. Do you think that is so?—Certainly not; it is the average of the whole district which determines the rate, which is the basis upon which wages are based.

20,006. First of all the prices are settled upon the average ability of the whole industry?—Certainly.

20,007. And where we have been working in the various districts upon sliding scales, do you agree that those sliding scales have been adjusted upon the average ability of the district?—I think that they have been generally indicative of what the industry could afford.

20,008. The position of the best colliery is reflected in the situation equally with the position of the poorest colliery?—Certainly.

20,009. And no regard is really had to any individual colliery, whether it is good or whether it is bad?—No.

20,010. We have had several references made to the so-called prejudice to our national interests through the German use of our by-products. May I put it to you that what really happened was this: that the Germans, having special processes of their own, endeavoured to induce colliery owners here to adopt these processes, and suggested to them that they would take the by-products out of their plant over a period of years in order to finance the cost of the enterprise?—I have heard of those proposals, but I cannot mention firms in which they have been adopted.

20,011. Would you take it from me that really what lay at the bottom of this transaction was really a financial arrangement between these companies and the Germans, who were endeavouring to induce them to accept their special plant?—I should think that is probable.

20,012. There was nothing political behind the situation?—Nothing, I am quite sure of that.

Mr. Robert Smillie: Sir Adam Nimmo put a leading question to Lord Gainford on a matter as to which he said he knew nothing at all.

Witness: I have said quite truthfully that I do not know of cases of these firms, but I have heard that such propositions and such financial relations have been suggested. Perhaps I ought to have said that in reply to you.

20,013. In your last answer you said there was certainly nothing political about it?—I say there was nothing political about it if these things occurred.

20,014. Sir Adam Nimmo: It may be as well that some enquiry should be made as to whether what I have suggested is or is not the fact?—Then you must get some other witness, because I know nothing about these German firms that are alleged to have financed coke ovens in this country.

20,015. Now I want to ask you a question regarding distribution. Is it your view that the position in respect of distribution has been a good deal prejudiced by what has taken place during the war? It has been said that consumers of household coal

were discontented with the existing state of affairs, and it naturally falls upon the mine owners when anything concerning the article which is produced at the mine produces discontent. Everybody condemns the mine owner, no matter whether he is responsible or not. When a system of control exists the coal distribution is regulated, and customers are obliged to take whatever the State gives them, irrespective of the wishes of the consumer?—Yes.

20,016. Would you also say that the difference between the pitbank price and the price to the consumer has been greatly accentuated during the war?—It is obviously so. First of all, you cannot get horses and trollies to carry coal in many towns. The difficulty of feeding the horses alone has enormously increased the price for the transport of coal from the railway to the consumer's door.

20,017. Deliveries have been made entirely in abnormal circumstances?—Quite so.

20,018. And you have suggested that there have been the difficulties of men and the high wages that had to be paid and various other disabilities of that kind?—Certainly.

20,019. Do you say that the distributor of coal has had the position prejudiced in this Enquiry by what has happened in that respect during the war?—Enormously, because the distributor in many cases has had his customer, to whom he was previously giving satisfaction, taken away from him, and he has very likely not been able to deal direct with the firm he has previously worked for.

20,020. You would agree, would you not, that there were no such differences in price before the war?—The margin was, of course, very much less than it has been during the abnormal times of the war.

20,021. There was a good deal of competition, was there not, between merchant and merchant?—Before the war, certainly.

20,022. Would it be your view that that maintained a reasonable position as far as the market was concerned?—Competition always tended to prevent abnormal profits being secured by any individual merchant.

20,023. There may have been differences of opinion I take it as to whether certain middlemen are necessary or not, but would you say that on the whole before the war the coal merchant served a very useful purpose?—I think I have already answered that question, and I said I thought in many cases a merchant's existence could be justified; but there are many cases I think in which it might be to the interest of the country that the consumer and the producer should be brought more nearly in contact with one another; and that was my suggestion why co-operation might be beneficial to the general community in securing a cheaper delivery price in some of our large towns and cities.

20,024. I think you express the view that municipal distribution might develop a rigid departmentalism?—I did suggest that, although I said that might not take such an aggravated form as by the State.

20,025. Do you know anything of the work of the Coal Mines Department in the rationing of coal?—Only through our own agent, who has reported to me exactly the procedure in connection with distribution.

20,026. Do you know that it has also some tendency to develop very rigid regulations?—I am quite certain of it.

20,027. Have you heard of cases where under the system of rationing that was carried out some of the largest centres received more coal under the rationing scheme than they had received before the war?—I could not give you an illustration of that; but I have been told that it has been so; and I have also been told many other facts by sellers of a rather similar character—that coal is sent to one place and refused to another that is short of its previous destination, so that the system of scientific transport has not been carried out at all effectively under the Control system which was set up in order to save transport and wagon carriage.

20,028. I can suggest to you that in certain important cases more coal has gone to some of our large cities under the rationing scheme than was taken by the cities in pre-war days?—That may be so; it is not my experience in London.

20 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

20,029. You would not be surprised to hear that, would you?

20,030. *Mr. R. H. Tawney*: Do you know if that is so or not?—No, I do not.

Sir Adam Nimmo: Mr. Smillie put it to you that coalowners had not co-operated quite as much as they might have done in connection with distribution?

Mr. Smillie: I did not put it to him that they had not; I asked him if he thought they had?

Witness: I cannot answer your question; I have not the knowledge.

20,031. *Sir Adam Nimmo*: Do you know anything about the work of the District Coal and Coke Supply Committees?—I only know from the reports of our own agents, who tell me that in the North of England we have worked quite smoothly with the Coal Controller; that he has helped matters rather than retarded them; but at the same time the great difficulty has been in the distribution, that you do not get the article to the person in accordance with the consumer's wishes. Everybody assumes that coal is coal, and that one bit of coal will serve the purpose of a consumer. May I say that once at one colliery we had 19 different varieties of coal which we had to sort separately in order to meet the requirements of our consumers; and if you send the wrong class of coal to a customer he is not only disgusted with it, but it does not facilitate his operations, and very likely the price of the commodities he produces are raised in consequence, and that all in turn is detrimental to the interests of trade.

20,032. Do you know of quite a number of large companies that have had to pay very much more in railway carriage under a scheme of distribution than they paid before?—I know that in certain cases much larger payments have been made and coal has been sent to districts which have never been reached before by dispatch from certain mines.

20,033. Do you know that these District Coal and Coke Supply Committees operate in the different parts of the country?—Yes.

20,034. Do you know whether their membership is composed very largely of coalowners—in some cases entirely of coalowners?—Well, I have always understood that representatives of their interests were appointed on the Committee.

20,035. And that these coalowners have undertaken the vast amount of work and responsibility connected with the carrying out of the distribution scheme?—They have done their best, but they were often thwarted as to the direction in which they desired orders to be given and the character of coal sent.

20,036. They have been thwarted from headquarters?—Yes.

20,037. Do you suggest in that connection that local knowledge has been set aside in favour of direction from headquarters?—It is not only local knowledge, but what has been set aside in that direct touch between a consumer and producer which formerly existed and which has over a period of time resulted in a satisfactory trade being conducted. It has demoralised the whole system of trying to secure for each works the best class of coal to suit them.

20,038. Your view is, I take it, that the sooner the old system is restored the better?—I am certain we shall then get on to right lines and become productive and develop.

20,039. You had put into your hands a Table of Salaries paid to the Managers?—I had.

20,040. Have you that statement before you?—Yes.

20,041. Do you observe that it contains merely a division into those who hold first-class certificates and those who had second-class certificates?—Yes; and I would point out that many of those who hold first-class certificates are acting as under managers.

20,042. So that in this return which has been made you may have in the first category a large number of under managers?—That is quite possible.

20,043. Is it not the case that a very large number of the under managers hold first-class certificates?—Yes, that is quite true.

20,044. So that as far as showing what the managers' salaries are it does not give you a true indication?—It is not at all a true indication. First of all, the column stops at £1,500. I know of salaries

of managers which exceed £2,000—several I know of—and of course one cannot base any real conclusion upon a statement of this character, if I may say so, because, first of all there are 610 colliery concerns out of 1,500 colliery concerns, and a great number of colliery concerns may be quite small and insignificant little land sales. On the other hand, they may be very representative.

20,045. *Sir L. Chiozza Money*: It is nearly half of the whole?—Yes. It depends on which return is given. Now I know that a large number of under managers' returns have been sent in, because people did not know whether the return was to really refer to managers or under managers, and some firms have dealt with the returns in one way and some in another; and I want to point out that if they had been sent to them all it is the small ones which would naturally fill up a form like this first, and if a man has six or eight men in his own little field working a little outcrop of coal he can return that by the next post, whereas a big firm would take a longer time. I do not want unnecessarily to condemn this, but I want it to be a complete return before I draw conclusions.

Mr. Robert Smillie: May I point out that they do not require a certified manager at a small concern employing less than 30 people? When you take the small mines, very many of them do not employ a first-class certificated manager.

Sir Arthur Duckham: May we have it cleared up whether this does include under managers?

Chairman: I cannot tell you any more than it says. All it says at present is first and second class certificates.

Sir Arthur Duckham: It is rather misleading if it is under-managers as well.

Sir Leo Chiozza Money: As this is so important, Sir, could we compel a return from every mine describing exactly whether a man is a manager or an under-manager?

20,046. *Chairman*: Yes, we certainly can. We are getting it. The only point is this: this is the evidence up to date. We shall have a great deal more evidence in a day or two. Would you tell me this: You instance the case of some gentlemen getting over £2,000?

20,047. Were they managers simply or agents?—In the County of Durham several firms that I know have a head viewer who is responsible for a group of collieries. At each colliery there is a mines manager certificated first-class in charge of those collieries, and any difficulties or any points come from the mines manager up to the head viewer. The head viewer himself goes underground like all the other managers. The head viewer, who is a mines manager, and I think ought to be included in a return of this kind, would receive £2,000 in the case I know of.

Mr. R. W. Cooper: The head viewer is generally qualified for the purpose of the Mines Act as the agent. The head viewer may get £2,500 a year, and then the managers are managers at the individual pits.

20,048. *Sir Adam Nimmo*: I think it would have been more illuminating in connection with this return if we had had the schedule upon which it was made up, and also that we should have had some indication of the responsibilities of the men as shown by the number of persons employed and the output?—I think it would have given more useful information. It is incomplete as it is.

20,049. The salaries are evidently greater according to the measure of responsibility?—And also according to the proved capacity of the men.

20,050. I notice that Mr. Smillie made some special reference to the salaries paid in 1913, and particularly to the lower salaries. Is it the case that if you turn to the schedule applicable to 1919 you see very considerable advances shown?—It is so.

20,051. And that you have a large number of managers who have salaries of from £500 and upwards?—Yes; and may I make another suggestion, and that is that, in order to secure complete information, any system of war bonus ought to be included in the salaries now being paid. It is quite possible that a man's salary is fixed at a certain figure, and

20 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

there is a war bonus being given him which may be continuing for some months, and it might be a point as to whether that should be continued or not.

Chairman: We are having all that information. Of course, you cannot do these things in five minutes. There are 3,300 mines to look into, but we will try to do it in 24 hours.

Mr. Robert Smillie: Would you get a return of how many men are paid a certain percentage on so much increased output?

Chairman: That shall be put in hand this afternoon.

20,052. *Sir Adam Nimmo:* It has also to be borne in mind that in a great number of cases they include a supply of coal and the provision of a house?—That is so.

20,053. You were asked one or two questions by Mr. Cooper with regard to the machinery of conciliation in Durham, and I think your view was that it was very good. Do you know anything about the machinery of conciliation that exists in other parts of the country?—No, I cannot speak of that first-hand.

20,054. Would you say that, generally speaking, there is machinery of conciliation in all the districts of the country?—I have always understood that there is, in every mining district, a system more or less similar to that which we have in Durham, but the details of it I could not explain to this Commission.

20,055. Mr. Smillie also put this question to you in regard to the question of joint control—he seemed to be disposed to distinguish between the management and commercial control. Do you draw any distinction?—I think, in regard to management, that it is absolutely fatal to the industry to have the executive control of the management of the colliery entrusted to any joint body. I think the

decision in connection with all cases of management ought to be in the hands of the management, and, of course, the directorate, which is the ultimate management, are in duty bound to place all responsibility upon the agent or the mines manager.

20,056. Is it your view that responsibility in connection with the commercial side would require to follow financial responsibility?—I think that is so, but I believe there is much more opening for bringing to the knowledge of workmen what is being done in connection with the sales of the produce of a colliery, and I think that if the shareholders were wise, wherever they could find a useful, capable person who was going to act loyally in the interests of the concern, they might place such a man upon a Board, that he ought to be there to promote the interests of the concern and not the interests of a more class, to help the concern in its working arrangements, and that in that way he would get a knowledge of the commercial work. I think that system ought to be beneficial, and would be appreciated by the men.

20,057. I suppose you mean by that that they really must have a common purpose based on financial interests?—That is so.

20,058. May I refer, for a moment or two, to the scheme which is proposed by the owners? Do you consider that an attempt to give the men a definite interest in the industry?—Yes, and I believe if the men were loyally to adopt it, they would find it work quite smoothly from the very fact that on the basis of a somewhat similar scheme, so far as wages are concerned, a successful negotiation carried out by the County of Durham is, I think, the best evidence that I can give that a system of this kind would work to the mutual satisfaction of owners and pitmen.

(Adjourned to to-morrow at 11 o'clock.)

SECOND STAGE—SIXTEENTH DAY.

WEDNESDAY, 21ST MAY, 1919.

PRESENT:

THE HON. MR. JUSTICE SANKEY (*in the Chair*).

MR. ARTHUR BALFOUR.

MR. R. W. COOPER.

SIR ARTHUR DUCKHAM.

MR. FRANK HODGES.

SIR LEO CHIOZZA MONEY.

SIR ADAM NIMMO.

MR. ROBERT SMILLIE.

SIR ALLAN M. SMITH.

MR. HERBERT SMITH.

MR. R. H. TAWNEY.

MR. SIDNEY WEBB.

MR. EVAN WILLIAMS.

SIR RICHARD A. S. REDMAYNE (*Assessor*).

MR. ARNOLD D. McNAIR (*Secretary*).

MR. GILBERT STONE (*Assistant Secretary*).

The Right Hon. Baron Gainford of Headlam, Recalled.

Witness: Sir, may I make a personal statement, if I may, in connection with an answer which I gave to Question 20,010 put to me by Sir Adam Nimmo? It was with reference to the German use of our by-products, and I answered, "I have heard of those proposals, but I cannot mention firms in which they have been adopted." I am reminded now that in 1903 the Otto Hilgenstock Company, which was an English firm, was controlled by Germans, and that it

was financed in Germany. But if I was aware of those facts at the time, I admit I had entirely forgotten them, and I think I ought to make that quite clear. That firm had on its Board English directors whom my firm personally know. We employed that firm under a contract to erect ovens for ourselves with an arrangement that they should use, so far as it was possible, bricks of our own manufacture. Under the contract arrangement there was a provision

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

that we might repurchase the whole of the outlay within a period of either two or three years, and although they had for a period the disposal of the bye-products, yet they only received a comparatively small percentage of the returns secured by those bye-products. In that way we secured not only experience in the erection of those bye-product ovens, but we had the experience of maintaining them under their control for two years, and the experience connected with the manufacture of bricks which we regarded as very important for our own benefit in the future. We obtained the full possession of those ovens within two years or three years at the outside of their erection. We subsequently employed the same firm under contract to build other batteries, but they had no financial interest whatsoever in the success of the other ovens when they were built, or of any bye-product which was secured as the result of the operations and the manufacture of coke in those retort ovens.

Then, Sir, there is one other thing you asked me about in order that it might be placed upon the notes, and that is with regard to Command Papers 7401 and 7616. Command Paper 7401 is the Annual Statement of Trade of the United Kingdom with Foreign Countries and British Possessions for 1913 issued by the Statistical Office of the Customs and Excise. Command Paper 7616 is the Annual Statement of Shipping for the United Kingdom for the year 1913.

Chairman: We are much obliged to you.

Sir L. Chiozza Money: Sir, may I ask if there has been an opportunity of enlarging the Report with regard to the mine managers' salaries?*

Chairman: There has not been any opportunity, because we are having the table rather differently arranged with additional information asked for by Mr. Herbert Smith and yourself, which I thought was very valuable.

Sir L. Chiozza Money: Could we have a return of the salaries paid to the postmasters in large and small towns in the United Kingdom with a description of how advancements are made, whether from a smaller town to a larger town, or by what method the appointments are made?†

Chairman: Yes, that will be of assistance.

20,059. *Sir Adam Nimmo:* (To the Witness.) When we adjourned last night I was proceeding to ask you one or two questions regarding the scheme which you proposed for the future conduct of the industry. I observe that it is proposed that wages should no longer be based upon prices?—It is a proposal that they should be based upon profits rather than prices.

20,060. Now the first thing you set out to deal with under the scheme is to provide for a minimum wage. What is the nature of a minimum wage you have in your mind?—My idea is that the minimum wage in the country, which, under the proposals of the Industrial Council, I understand the Government are going to accept, is that there shall be a minimum wage established throughout the whole country by the Industrial Council, and it seems only right and fair that the minimum wage, which presumably will be based upon securing to labour an adequate remuneration to meet the necessities of life, should be correlated together in some way. I do not hide from myself the importance of the fact that where men go underground some recognition should be given them in connection with the dangers as well as the difficulties connected with their employment. But I think it is important to the general consumer and to the nation as a whole that the minimum wage should be correlated, and that it should not be dictated by merely one trade union organisation to the whole country.

20,061. Your suggestion in respect of a minimum wage is that it should represent a fair standard of living?—Certainly.

20,062. And your reason, I take it, for suggesting that the minimum wage should be fixed under the machinery to be set up by the National Industrial Council is that it may be correlated to the minimum wages in the other industries of the country?—That is exactly my view.

20,063. Do you hold that, in the long run, it would be possible to secure a privileged position for the

miners in respect of a minimum wage?—I feel that the privileged position should represent the increased dangers attached to their calling, with, perhaps, some recognition of the discomfort of their conditions as compared with other industries. But while you are on the subject of minimum wage, may I correct something that was stated yesterday by Mr. Herbert Smith in asking me a question? At Question 19,937, Mr. Herbert Smith suggested that the 5s. 6d. in Durham was the minimum wage; 5s. 6d. in Durham no doubt was the minimum wage up to 1912. It was under judgment given, I think, by Sir Robert Romer. But by mutual agreement since then the minimum wage has been increased in the County of Durham to 8s. 8d. In addition to that they have the 3s. war bonus and the 2s. which is called the Sankey increase, making 5s. That brings the minimum wage up to 13s. 8d. instead of the 5s. 6d., which I think was indicated by Mr. Herbert Smith. I think that perhaps ought to be made quite clear.

Mr. Herbert Smith: We had better correct that. That minimum wage of 5s. 6d. existed in Durham until after the war commenced.

Witness: It was 1912, I am informed.

Mr. Herbert Smith: We will call a witness to prove that. Percentages were commenced to be added when the cost of living went up, but not before.

Witness: I made enquiries, because I was rather surprised when I heard the minimum wage was put by Mr. Herbert Smith at so low a figure as 5s. 6d.

20,064. *Sir Adam Nimmo:* (To the Witness.) After fixing the minimum wage as suggested, your scheme proceeds to deal with the items of cost of production?—Yes.

20,065. How do you assume that those items would be adjusted? Would it be between the parties?—There is machinery set up in our scheme for agreeing to the procedure. The accountants in some cases, as will be seen, who are appointed by both sides, will determine the differences if any exist, and in other cases the Joint Committee.

20,066. Would you anticipate any difficulty in adjusting these as items of cost, if highly skilled accountants were appointed for the two sides?—No; I believe highly skilled accountants can deal with the costs. It is their business to do so. I think it is very important that they should have access to every document in every firm so as to secure absolute accuracy, but I also hold the view very strongly that if you are going to secure the best results from private enterprise, it is important that there should be some regard to the fact that these figures should be regarded by the accountants in their detail as confidential, but that they should produce an average result from their investigation for the whole district. It would be the average of the district which would form the basis of the arrangement between the workmen and the masters in regard to the percentage of profits which they should secure upon their wages and capital respectively.

20,067. The scheme is intended to be dealt with by districts?—Yes, by districts.

20,068. And only average results would be brought out and dealt with?—Yes, brought out publicly.

20,069. Now thereafter, I understand, you proceed to determine a minimum return upon capital in respect of profit and redemption?—Yes.

20,070. Having ascertained these different items (the minimum wage, cost of production, and the return from capital) the margin between that figure and the realised price would be the divisible margin between the parties?—Yes. The whole scheme, if I may emphasise the point, is directed to give to the workmen for the first time a real interest in securing increased production. Without increased production you cannot secure decreased cost. If there is an increased production per man per shift, the result will be a diminished cost of production and the margin of difference will be constantly increasing, with the result that the men have a direct incentive to do their best in their respective working-places.

20,071. So that under the scheme the workman would be interested both in the volume of production and the cost of production?—That is the object of the scheme.

*See Appendix 66.

†See Appendix 67.

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

20,072. And I take it your view is that volume and cost of production are of the greatest importance from a national point of view—I think they are absolutely essential for the future prosperity of the country, and until we get into a condition of real increased production, we shall continue to have great difficulty in making our financial ends meet.

20,073. Do you see how we can maintain our export trade unless we get an increased volume of production?—I am very apprehensive of the competition which is threatened us from the United States and other areas where there are coalfields in connection with the export trade, and unless we are able to increase our production and reduce our cost, I am satisfied that not only will we not be able to maintain the magnificent export trade developed before the war, but we shall lose a great portion of it.

20,074. Do you think it would be a great advance to interest the workmen both in volume of production and cost of production?—I feel certain it would be so.

20,075. Then I understand the scheme proceeds to deal with the setting up of machinery to secure the fullest co-operation within the industry?—That is the intention.

20,076. And you think, based upon the principle of co-operation and not joint control, what is proposed is reasonable and adequate to meet the circumstances?—Quite, and I think it is the natural result of all the experience of the past, and it is the natural evolution which should be expected from the operations of the past, if we are to continue on progressive lines.

20,077. Would you go so far as to say that the scheme you propose should meet all the reasonable aspirations of the workmen?—I do.

20,078. *Mr. Sidney Webb: (To the Witness.)* I propose, as time is short, to confine myself to one subject only. I hope you will not think I am ignoring impolitely many very important points. Will you be good enough to help the Commission by elucidating a little further your plans for the future? May I begin with the proposed control over mining royalties? I gather you think that the present position of the royalty-owners, in point of view of the nation and the industry, is not quite satisfactory?—I have always held the opinion that there are isolated coalmen who put difficulties in the way of securing the proper and most economical working of minerals underground.

20,079. You refer to the Interim Report of the Ministry of Reconstruction Committee, and you adopt, I gather, their proposals. You will remember that the Committee made (if I may call it so) an indictment of the royalty-owners on 14 points?—Yes; I have read the Reports, including the one which appeared in the Press yesterday.

20,080. Of course any indictment of that sort always has reference to what we may call the less satisfactory members of the class. It is quite compatible with many of the royalty-owners being quite perfect, is it not?—Yes.

20,081. We are thinking only of those who are less satisfactory (I do not mean in conduct) where there may be difficulties with regard to estates and so on, and it is that class of difficulties which you think ought to be met by an authority?—Yes.

20,082. And you would give this authority, I gather, so far as the royalty-owners are concerned, very large powers?—I would.

20,083. I notice that you say that they should have power to make orders not only with regard to rights of user or working but even ownership?—Yes, subject to fair compensation being paid for real loss which they may sustain by what they might otherwise regard as confiscation.

20,084. But subject to such equitable arrangements you do not shrink from giving to a State authority compulsory powers to interfere with ownership of minerals in those cases in which it may be shown to be required?—When it is proved to be in the national interest in the conservation of mineral resources.

20,085. And in the exercise of those powers you lay stress upon a strong Advisory Council in which representatives of labour will sit?—That is the re-

commendation which we are prepared to accept in principle.

20,086. All that is with regard to royalty-owners?—Yes.

20,087. I wanted to ask you whether you thought anything of that sort was necessary with regard to colliery owners?—I have yet to learn that the colliery owners have been holding up coal which was needed by the nation.

20,088. I do not want to discuss the point, but I gather of course that you are suggesting that the royalty-owners must be controlled even to the point of interfering with their ownership where necessary under proper conditions, but you do not see any necessity for the coalowners being controlled?—I do not, because I believe that the demand for coal which the nation has put forward has always been met by the industry; but in individual cases where the coalowner has required the coal he has not been able to secure it in the most economical way. Therefore I think a case has been made out for compulsory powers being given to a sanctioning authority in connection with royalties.

20,089. It is very natural that we should accept you as a very competent witness with regard, shall I say, to the shortcomings of the royalty-owners, but possibly, might I say, you are not quite so authoritative a witness with regard to the shortcomings of the coalowners?—Well, I have had my attention directed to every shortcoming which can be alleged against them, I think.

20,090. Now may we go to the other end of the industry, the distributive end? I think you are suggesting in your evidence that there might be advantages in interfering with the present organisation of distribution in the cities?—With regard to cities and towns I have less knowledge of distribution than in any other direction, because my experience has been almost always direct with the consumer and with selling in much larger quantities to big industrial consumers than in small lots of hundredweights and tons to consumers in cities and towns.

20,091. But you do occasionally live in London, do you not?—Yes, and I suffer with everyone else from the high price of coal.

20,092. Apart from being a producer, you have knowledge of the difficulties of distribution in London, have you not?—I think they have been magnified at the present time very much.

20,093. But you do suggest that they might be dealt with and especially that possibly (I do not want to take it too far) cost might be reduced by a co-operative or municipal system?—I believe that is possible, and I think it might be an advantage to the community.

20,094. May I draw attention to the fact that if you divide the industry into three parts, royalty-owners, coalowners and the distributive system, you are suggesting the need for rather drastic changes with regard to two of those parts, but not the third? I quite accept it, as probably your view, that the coalowners do not need any reform; but you notice you are suggesting drastic reforms with regard to the other two-thirds of the industry?—I think wherever evils exist you should endeavour to secure reform; but everything in connection with change is a question of balance. If you destroy private enterprise, which I understand is your object, to my mind it is going to kill the whole of the industry, and it will affect not only the royalty-owner and the distributing merchant, but it will destroy the whole industry for the whole country upon which the welfare of a great deal of the industries of the whole country depends.

20,095. It might save time if we left myself out of consideration and kept ourselves to the question. I gather that you suggest if we want evidence as to the shortcomings of the coalowners, it would be natural for us to go to the other two-thirds of the industry: perhaps we might ask the royalty-owners about the coalowners, or the distributors about the coalowners?—I hope you will.

20,096. With regard to the shortcomings, if you may call them so, of the coalowners, you are very strongly against, as I gather, anything in the nature of joint control among the owners themselves?—I

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

have already indicated in my evidence-in-chief that I think a certain amount of co-operative buying of materials might be of advantage. I have also indicated that economy of purchase can be secured by firms if they are purchasing for a group of collieries; but, if you get too many, the advantages no longer exist, and you can get a formation much too big to secure the very best purchasing in the open market.

20,097. At any rate those co-operative arrangements have not hitherto been made?—The tendency has been for the smaller collieries to be purchased to a certain extent by the larger ones.

20,098. There is a tendency to absorption?—To absorption up to a certain point.

20,099. May I point out that there are still fifteen hundred separate colliery concerns and so far as I know there is no joint buying among them or joint sales?—There are a certain number of very small collieries and, of course, there are a certain number of very big collieries owned by one firm; but I am an advocate of the very small concerns being amalgamated so as to co-operate with one another with a view of purchasing upon economic grounds.

20,100. Would you give the Commission your opinion as to whether there exist at the present time any co-operative arrangements for buying or for selling among the fifteen hundred separate concerns?—Not in the true sense of definite organisation to secure that end so far as I am aware.

20,101. And consequently you suggest that economic financial advantage would probably be the result if suitable joint arrangements were made?—Yes. Take the illustration, say, of timber. One timber merchant could purchase timber for a group of comparatively small collieries probably better than six or seven men, even if they went into market one against the other.

20,102. But you do inform the Commission that in your judgment certain economies and financial advantages could be secured if you had co-operative arrangements and joint arrangements among the fifteen hundred colliery concerns or some of them which have not yet been made?—They are comparatively few, but I do not want to exaggerate the importance of that. When I take one item of cost it is quite possible that an economy might be effected; but on the other hand, sometimes an individual firm, although it is isolated, may be able to buy another item at less cost than if grouped with others.

20,103. I think you have some experience of railways, have you not?—Only indirectly. I have never been a railway director, for instance.

20,104. We have practically about 20 or 30 different railway concerns owned by about 200 companies?—Yes.

20,105. Would you be surprised to hear that they all buy separately?—I should not be surprised to hear it at all, and I think if they all bought together the nation would have to pay a good deal more for the commodities they buy than if they bought separately.

20,106. That is your opinion?—Certainly, it is my opinion.

20,107. I wonder if you know what the Government is being advised on that subject?—No, but that is my experience.

20,108. Would you be surprised to learn that there has been very expert advice to the effect that at least 20 per cent. saving on the aggregate purchases of the railways would be secured by unification of buying?—I have no doubt there are a great number of theorists, and some practical men possibly, who would advocate that kind of purchasing, but in actual practice—I have had a great deal of experience of Corporations and County Councils and in connection with large firms—I am quite satisfied when you get the purchasing of commodities placed on too big a scale you do not get an advantage.

20,109. You beg the question when you say "too big" a scale. It is obvious if anything is too big it is bad. What is "too big"?—On a scale such as you suggest in the nationalisation of the railways in this country. I do not believe you would get any economy in purchasing.

20,110. At any rate you have definitely given us your opinion that there are economies to be made in joint purchase by the fifteen hundred collieries?

—In very small concerns in connection with some materials; I do not want to exaggerate those economies, but I think some can be effected.

20,111. And the financial self-interest of the separate concerns has not hitherto led them to make these economies?—No. They have preferred to compete with one another, but there are occasions, no doubt, when they do secure one buyer for two or three in connection with some material.

20,112. At any rate, therefore, that is one point. You will remember that Sir Richard Redmayne definitely said: "In my opinion the present system of individual ownership of collieries is extravagant and wasteful. That is a somewhat daring statement, but I am prepared to stand by it whether viewed from the point of view of the coal-mining industry as a whole or from the national point of view, and I think by thoughtful persons on both sides, both the owners and the workmen, that is pretty generally accepted." Probably you do not agree with that?—No, I do not. I do not think he sustains his proposition.

20,113. Would you help the Commission by taking the various points? You have already said there is some economy—I do not want to exaggerate—by joint buying to a certain extent. That was one of his points. Then he said there would be prevention of waste due to the following fact: the prevention of competition leading to a better selling price for export coal. Is there a good deal of competition between British exporters at the present time?—The controlled price was only removed two days ago—

20,114. Never mind the controlled price, I am speaking of the normal state of things?—Under the normal state there is no doubt competition which secures to the consumer probably the article which suits him best.

20,115. We are speaking of the foreign consumer. Therefore it is suggested that if there were combination among exporters they would secure a better price. You have had experience of combinations, I think, in your industry?—We have tried them, but I do not think they have been a great success. In connection with trying to secure prices and avoiding what is called "cut-throat competition," my experience, taken as a whole, is that there are moments when a demand is so great and the supply for the moment is not equal to the demand that competition appears to run to excess, and perhaps the highest possible price at the moment is not secured owing to competition.

20,116. Surely you would not wish the Commission to understand that that is an exceptional case. I have just sat on a Committee of enquiry into trusts and combinations, and we had evidence from every industry as to the prevalence of combinations and as to their success?—But then I want you to realise that there are also times when exactly the reverse takes place. Taking the average, I do not think that we lose much value, if any, in the aggregate, in connection with the price that we obtain from the foreigner by what is called cut-throat competition.

20,117. May I ask whether your firm does not enter into combinations in any branch of its work?—We confer often with those who are selling.

20,118. You call it "conferring"?—Yes.

20,119. "Conferring" is as good a word as any if it has the effect?—There is no obligation when you confer as to the price at which you will sell.

20,120. But you do confer as to the prices at which you will sell?—We try to get the best we can for our commodities just like any other tradesman.

20,121. And the method you take to get the best price is by conferring?—Sometimes by conferring.

20,122. It is suggested that if the exporters conferred a little more they would get a better price?—I do not think they would over an aggregate period.

20,123. You think you do in your firm by conferring, but you do not think the others do?—When we and they think it is advisable to confer as to the price we should ask from a particular purchaser of our commodity, we confer; but when we think we can do better in our own interest we are under no obligation to continue the conference.

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

20,124. That is what is called a gentleman's agreement?—It is a natural way of conducting an industry for the best interest of the nation.

20,125. But on the whole it pays your firm to confer?—If there are circumstances in the conference which render it advisable, certainly.

20,126. If your firm does, from time to time, enter into these conferences it does so apparently because it pays the firm to do it?—No doubt it does at that particular moment.

20,127. Therefore, with regard to the suggestion of Sir Richard Redmayne, that a conference of this sort would lead to better prices, I think you confirm that?—No, not on the whole. Over a long period or a period of three or four years, you will obtain just as high a value from the foreigner for your produce as you would do under any compulsory obligation with fixed prices.

20,128. But I have not said anything about compulsory obligation with regard to fixed prices?—I thought your questions were directed to that end, but I may be wrong.

20,129. Why do you draw that inference? Let us go back. You have definitely told the Commission that your firm on the whole, I think I may say, found it advantageous to enter into this sort of combination, and that on the whole, in the long run, you get a better price by it?—I do not say "combination."

20,130. Either you do or do not?—"Combination" is a much stronger word than I have used.

20,131. Shall we say "conference"?—Yes, let us adhere to the word "confer."

20,132. By this system of conferring, in the long run, on the whole, your firm finds it gets better prices?—At times.

20,133. Not on the whole? You do not deal with the thing on the basis of one year. Your firm is one of those firms which properly plays for the future in the long run?—We look at it as a whole and there are times when conferences are in the interests of our company.

20,134. Either you will tell the Commission or you will not, whether in the long run your firm gets better prices by entering into these conferences, or do you enter into these conferences for some other reason than because it pays you in the long run?—My answer is that occasionally it may be to the advantage of the firm.

20,135. When you say that it may be to the advantage of the firm you are not answering the question. May I ask with what object you enter into the conference? Are you in business for your health?—We enter into these conferences with a view of securing the best price that we can for our respective commodities. At that moment it is an advantage, but another moment comes when it is not to the advantage of the trade and we do not do it.

20,136. Over a period of years you do enter into conferences with regard to price. Now and again, and taking the period of years as a whole, entering into conferences at those times is an advantage to you? Can you not agree that possibly it would be an equal advantage to the export trade?—But we do it in connection with the export trade now and again.

20,137. Now you do not do it with regard to the inland trade, do you?—Yes.

20,138. You do do it with regard to the inland trade?—Yes.

20,139. Then there is no perfect competition among coal-owners which secures to the consumer the lowest possible price?—There often is.

20,140. I am very glad to learn that there is often competition among the coal-owners for the benefit of the consumer, because that implies that the normal state is not that of competition?—Competition is always operating in the system which is adopted in the industry, and it is through competition that we are able to secure the best results, I believe, in the interests of the nation.

20,141. For the coal-owners?—And for the nation.

20,142. But not for the consumers?—And for the consumers. If you cannot reduce by competition

your costs, you cannot give to the consumer the advantages of reduced costs.

20,143. Apparently it is to the advantage of the consumer that you should reduce your costs, but you do not necessarily give him that advantage in the reduction of price?—As a rule it follows.

20,144. As a rule. Sometimes you do not give him the advantage in the reduction of price?—If you are able to reduce the price owing to the reduced cost, the natural result is to encourage the consumer to buy more largely.

20,145. If you do reduce the price?—Yes, if you do reduce the price.

20,146. But you have just told me that you enter from time to time into combinations to enable you not to reduce the price?—That is exactly how the trade is carried on and I am afraid that—

20,147. I know that. I ask you to explain. The trade is carried on by entering into combinations so as to obviate a reduction in price which would otherwise have to occur if the combination was not made?—Will you allow me to make my point, which is this: that when you are to secure a continuous custom and increasing custom, you have to meet the necessities of the consumers of the country, and there are times when you can, in the interests of your own concern, increase the price against the consumer, and you do not hit his industry; and there are times when you have to help him with a view, either to increasing his consumption, or to enabling him to carry on his concern. Therefore you must have that elasticity in your relations with your customers which is necessary to success.

20,148. You call it "elasticity," but, of course, other people might call it the use of a monopoly. Would that be wrong?—I think it would be wrong as long as you have private enterprise competing in firms for the custom of consumers.

20,149. But you have told me that it is necessary in your interests that those firms should be able to withhold a reduction of price?—No doubt.

20,150. That is what we call monopoly among economists?—I do not see where the monopoly comes in myself.

20,151. You told me the coalowners do not do that any more than other traders?—It is the natural way of conducting a trade. You try and cultivate the custom of your customers.

20,152. But you also try to retain as much of the enhanced price as you can, having regard to what you call their necessities?—Yes.

20,153. When Sir Richard Redmayne pointed out that there might be economy of administration, he said, "There is no doubt about it, I think, that under a system of combination a number of managerial expenses would be less; in fact their administrative expenses would be less." Do you think that there is any possibility of a reduction of the administrative costs of the fifteen hundred separate concerns?—Speaking generally, very little.

20,154. But a little: there would be something?—There are always certain concerns which are not, obviously, at any given moment, carried on so economically as they might be. The world is not perfect. It is like tradespeople in shop-keeping. One shop-keeper does not manage his concern so economically as another, but the competition between him and his neighbours does secure an improvement which would not exist under any other system.

20,155. I think you have forgotten what you just said about the coal distribution trade, because you suggest the stopping of competition there, and its being carried on under a unified co-operative system?—I think if a few people who are buying in hundred-weights can buy at a less price in tons, it is obviously to their interest; but at the same time, I think it is very advisable that there should be no monopoly in the sales so that there should be competition, and so that they can secure the best price which is possible under the circumstances.

20,156. There is the further point as to provision of capital allowing for increase and more extensive development of backward mines. I do not see anything in your proposals which would result in the application of capital to such part of the 1,500 con-

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

cerns as are not able to get the capital?—If the concern can be carried on at a profit there is no difficulty in securing the necessary increased capital for its development. If a concern cannot be worked at a profit, in my judgment it is better that the concern that can be worked at a profit should be developed in the interests of the country rather than maintain an industry which cannot subsist upon its own bottom.

20,157. You are making it very simple for me, putting it down, to divide those concerns into those which can be carried on at a profit and those which cannot; but can we not take into account that some of the collieries could be carried on at less cost if they had better machinery and plant?—I think directly plant becomes antiquated the experience of the past proves that the colliery firm brings that colliery up-to-date so far as it possibly can, having regard to the necessities and circumstances at the colliery.

20,158. That is no doubt what your firm does, I suppose?—We are always devising the best and most economical ways of securing the coal from underground. We may have an old pit, and then we look to see whether it is not possible by driving a drift underground from some neighbouring colliery to secure the coal in the adjacent pit at a less cost than under the more or less antiquated machinery which may have been put up at the colliery several years ago.

20,159. Are you really suggesting to the Commission that all the 1,500 concerns are as well equipped or as much up-to-date as your collieries? Are there not some of the 1,500 which are not quite so ready to come up-to-date, and which have not quite those facilities for getting capital as your collieries?—I have said in my evidence-in-chief that there may be some exceptions in connection with a limited number of collieries, but speaking generally I am satisfied that there is no industry which is carried on in so up-to-date a way and which is superior to it.

20,160. But that is hardly the standard nowadays. I do not see in your suggestions any recommendations for remedying that particular shortcoming of the mines which are not up-to-date and are not able to get the capital. Have you any suggestion?—My suggestion is that the mines which can produce—

20,161. I am not saying the mines which can produce?—But I am.

20,162. Would you apply your mind to this question of the 1,500 concerns, as you have just said, which are not quite as efficient as they might be if they were better equipped. That is a national loss of course. Have you any suggestion by which those less well equipped mines could be brought up to the standard?—My reply is that under the system of private enterprise the tendency is always to bring them up to the standard and very rapidly if it is worth while carrying them on.

20,163. "Jam to-morrow, but not jam to-day," in fact, as the nursery adage says. As I understand, you say there will be a tendency for those badly equipped mines to be better equipped in the future, but at present they are working apparently to our national loss?—If you drive a flock of sheep through a gateway there must be some going last.

20,164. And if we have 1,500 concerns there must be some which are last?—They cannot be always in the same perfect condition with regard to equipment.

20,165. And it is impossible under private enterprise, is it not?—It is impossible in any industry, apart from the colliery industry.

20,166. You do not know of a way in which they could be made more efficient?—No.

20,167. Therefore while you have many suggestions with regard to making the access to the coal better, you have practically no suggestions to make for improving the administration of the coalowners?—I have made all the suggestions in connection with alterations in my evidence-in-chief which I think is in the interests of the trade and the nation at the moment.

20,168. All you have stated in your evidence-in-chief amounts to this, that you do not think it is desirable that there should be any interference with the separate colliery concerns in their organisation or administration of their industry?—Not by legislation other than that which has been indicated.

20,169. Is there any other interference?—I do not know whether there are any regulations which are not quite perfect. I do not exclude the possibility of that.

20,170. You do not suggest that there should be any alteration in the system of there being 1,500 separate concerns?—No; I am not advocating any change.

20,171. I only wanted to be quite clear. Now let me come to the more important point, namely, the relations with the workpeople. You have put forward very authoritatively on behalf of the mineowners a scheme for what I will venture to call collective profit-sharing—I am implying nothing by that. Would you explain a little more about that? You suggest the workmen should forego the present system by which their wages have some relation to the selling price. You suggest that that should be foregone?—No, it will operate, because it influences the margin between the cost of production and the selling price.

20,172. But in its present form?—Yes.

20,173. I suppose there is implied in your suggestion that in the bad years, when margins fall, their standard rate would have to be adjusted as it has been in the past?—Do you mean the standard rate of wages?

20,174. Yes?—Certainly.

20,175. That is to say, in the bad years they would have no security against having to accept a lower standard rate?—It would depend upon the decision of the Industrial Council.

20,176. Do you mean the Industrial Council of the whole Kingdom?—I think that to the Industrial Council will be left the consideration connected with any alteration of the minimum wage.

20,177. Yes, but I am asking about the actual miners' standard rate or county average in Durham, let us say. Do you suggest that the miners' standard wage will be altered by the National Council?—The Joint Committees will fix the local wage in accordance with the scheme of machinery which the men and the masters employ in the district.

20,178. Yes; that is only local, but the question is, what is the basis. I am anxious to learn from you whether you think the basis of the wage under this scheme is to be settled nationally by the National Council?—The minimum wage will be settled—

20,179. Pardon me! By the minimum wage is usually meant a legal minimum below which no employer or workman can descend, but it has no relation to the standard rate which the mass of the workmen have?—I have already explained that the local differences in connection with one district and another will be arranged locally by the Joint Committees in connection with their county organisation.

20,180. Would you leave the local differences out for the moment? That we can deal with afterwards. The question is, what is to be the basic wage upon which these local differences will be adjusted? At present that is settled practically by the Miners' Federation in connection with the Mineowners' Association in one way or another. Are you suggesting that in future that should be settled not by the Miners' Federation but by the National Council of employers and employed representing all industries?—In regard to the first wage payment, it will be settled through the Industrial Council; in regard to any alterations on that, it will be based upon local differences which have to be adjusted as they are to-day. There are no two coal miners, for instance, in a mine receiving exactly the same wages.

20,181. Thank you, but we are quite aware of that?—That is my reply—that these local differences must be adjusted, and then the percentages will come on the top of that based upon the scheme which has been put forward, which will be derived from the margin between the cost of production and the selling price ascertained by accountants.

20,182. We will come to that, but for the moment I cannot get clear from you what you mean by the basis. Let me put it in this way. At the present time the coal miners are getting a wage which is not in proportion to the minimum of some other industries. Now it is suggested that the National Council should lay down a minimum rate, but I never

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEARLHAM.

[Continued.]

understood that the minimum rate was to be the standard rate—that was only to be something below which no one would ever be allowed to go—but the ordinary rate which the ordinary workmen get would nine times out of ten be much above that. Now I gather from you that your suggestion is that the coal miners should normally, and except for supplements out of profits, be on this national minimum rate laid down by the National Council?—Yes.

20,183. That is what you propose?—Yes.

20,184. Of course, that will have to be laid down with reference to the dock labourer and the agricultural labourer, and also, under the equal wages notion, it will have to be laid down with regard to women. Are you suggesting as the basis of your scheme for the future that the miners shall, except for a supplement out of profits, be placed on the national minimum wage fixed by the National Council?—I have already explained in my answers to Sir Adam Nimmo that I regard it as very important in the interests of the nation as a whole that the payment for labour should be correlated in the various industries, and I have regarded the Industrial Council as the organisation which is going to secure that result.

20,185. "Correlated" is, of course, a very nice word, but would it not imply in your view that the higher wage, if it were correlated with that of the agricultural labourer and of the woman, even making allowance for the difference in exertion and danger, would come down?—From the present rate, certainly. I do not think it is likely to be maintained for a very long period at the present high rate.

20,186. Then you contemplate as the basis for your future arrangement a reduction from the present wages of the coal miners?—Well, it would have to be thresholded out by the Industrial Council, with a view to securing justice between the labour in one industry and the labour employed in another.

20,187. That is to say, that the coal miners' wage would depend upon what influence they could bring to bear in the discussions, not with the coalowners, but with all the other trades in the Industrial Council?—That is so.

Sir Adam Nimmo: In respect of the statutory minimum?

20,188. *Mr. Sidney Webb:* No. Sir Adam Nimmo asks me whether you do not mean in respect of the statutory minimum?—Yes.

20,189. But I have been trying to ascertain, and I think you have once or twice said to me, that by that rate you mean the normal standard rate which the hewer would get?—I say those are determined by the Joint Committees. Anything he gets above the normal standard minimum which is arranged by the Industrial Council will be determined by the Joint Committees.

20,190. Yes, but you have pretty well indicated to me that the actual wage of the hewer has got to be correlated (to use your phrase) with that of the agricultural labourer and the dock labourer and the woman?—With regard to the minimum standard.

20,191. Then you do not mean that you would put your percentage of profit on the standard rate, but on the minimum rate. I am sorry to misunderstand you, but you use the words here, "A minimum or standard rate of wages to be paid to each class of workmen in that district." Do you mean minimum, or do you mean standard, because they are vitally different?—Each man would have a different standard rate.

20,192. Each man?—Each class of man—probably fixed by the Joint Committee. If there was, we will say, a margin to be given to the coal hewer, may I assume for the purpose of an illustration that the standard rate of the hewer was 13s. per day, and he got 10 per cent., which would be his proportion of the margin of profit; that would bring his standard rate for the time being to 14s. 3-6d.

20,193. That would bring his earnings up?—Yes.

20,194. I suggest it would not alter the standard rate. You notice you are saying the standard rate would be fixed by the joint arrangements of the district, but in your print you say: "A minimum or standard rate of wages to be paid to each class of workman in that district, and which for the pro-

tection of the consumer should be fixed by machinery to be set up in conformity with the proposals of the National Industrial Council." I do not want to labour this point, but really it is very important to be clear. You are suggesting that a minimum or standard rate of wages should be fixed in conformity with the National Council. That is a very startling innovation in the coal trade, and I am anxious not to misquote you?—I have nothing to add to what I have already said.

20,195. Then it is quite clear the hewer's wages, except for a share of profits which he may be getting, would be fixed on the proposals of the National Industrial Council?—Plus the arrangements which he can get in connection with his wage through his Joint Committee in the district in which he works.

20,196. Then that is not the National Industrial Council at all. It is difficult to understand what you mean. If you mean it is going to be the Joint Committee between the Durham Coal-owners and the Durham miners who are going to settle the standard wage, what has the National Industrial Council to do with it?—It provides that there shall be a minimum standard wage for the—

20,197. A minimum standard wage. A minimum is different from a standard wage?—You may have a difference in your own mind, but I have no difference in my mind in connection with the wage which I regard as having to be determined by the Industrial Council. Whether you like to call it minimum or standard wage, it is based upon his work underground as compared with the work of other labour.

20,198. Let me give you an example and see if we can agree what is meant. I gather the suggestion is that the National Industrial Council should fix a certain wage which should be adequate to supply the necessities of life at a fair standard of living. Supposing we put that for the moment for the sake of argument at 30s. a week, then I understand that is going to be paid to the dock labourer and the agricultural labourer and the woman, but then each grade of worker would have a supplement to that in proportion to the difficulty of his work or the danger or discomfort. Therefore if we started at 30s. for the undifferentiated minimum, the hewer would receive more, and he might receive 50 per cent. more, or something like that, because of the danger and trouble. Is that not so?—Yes, he would receive more.

20,199. It would be assessed on this basic minimum, which would be based on the cost of the necessities of life for the labourer or the woman?—For the country as a whole.

20,200. Therefore, for the lowest grade of labour in the country. Obviously if you were only going to give the necessities of life you cannot give less to the industrial labourer?—That is for the Industrial Councils to determine.

20,201. You start with a base of the actual necessities of life, and the Industrial Council would settle the coefficient of the hewer at something above that?—For his minimum wage, yes.

20,202. I will leave that for the moment. Now I want to go on to this partnership which you suggest between the workmen and the employers in the aggregate in order to give them a direct incentive both to increase the volume and to lower the cost of production. I gather that that is going to be based upon an average percentage of profit to the employers in each district?—Yes.

20,203. That you quite properly say could be got by qualified accountants, who would have no difficulty in ascertaining it. Would the accountants have any authority to do more than accept the facts which were shown in the employers' books? Let me give you a concrete instance: supposing in one particular colliery concern the accountant said, "I notice that your cost of administration is very much higher than the normal, and, therefore, you ought not to be allowed anything more than the normal"; or do you mean that he will accept the actual facts as they are proved to him?—If he had inserted in his books items which ought to be excluded from his cost of production, it is the duty of the accountants to agree upon the elimination of any item of that kind.

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

20,204. The item might be legitimate enough; it might be such a thing as the salary of the Managing Director; but the question is the amount of it. If the accountant found firms extravagantly run, do you mean that the accountants would merely have to take the facts as they are, or should they have any authority?—They would have no authority to interfere with the items if they were properly presented to them and accurate.

20,205. Of course, you have made it clear that the accountants would only publish the average results, but would you mind explaining to me what security the miners would have under this arrangement that the owners were not charging much more—that is to say, were not giving too large salaries, for instance, or were not doing development work and putting it to the profit and loss account?—They would not interfere under the scheme with items of that kind, if they were over-extravagant on the one side or too parsimonious on the other.

20,206. *Chairman*: Assume there was an item, driving a hard heading for instance, which some people said ought to be charged against capital, and others against revenue—who decides that?—The accountants themselves would have to decide the principle as to whether these items should be placed and charged against revenue or against capital, and they would have to agree. I presume there is not any probability of their disagreeing, but in the event of their disagreeing in connection with any item of that kind I should suggest that they should call upon the Board of Trade to appoint an umpire between them, or to have some power of appointing an arbitrator to decide the question between them.

20,207. *Mr. Sidney Webb*: That is only on the point of whether a given item of expense is or is not properly to be included in cost of production?—Yes.

20,208. But my question is with regard to the amount expended. I may remind you that under the Excess Profits Duty arrangements, the Government thought it necessary to prohibit any raising of salaries. Would there be anything to prevent, in your scheme, any raising of salaries?—Not through the accountants. It would be out of their province.

20,209. Would there be any other way?—No, it is not suggested.

20,210. Supposing a colliery concern voted a considerable sum of money to each of its directors. I am not suggesting that your firm would do it, but you can imagine that it might be done. If they were going to divide their profits with the workmen, it would obviously pay them to value their services at a high rate and put that under the cost of production?—Under the system which obtained in this country, directors have no power to remunerate themselves. The remuneration is done through the shareholders in open meeting.

20,211. I am aware of that. It does not matter how it is done. You have heard of companies where there are no shareholders except the directors, have you not?—I believe there are some.

20,212. Apart from those cases, what is there to prevent a company writing up its salaries and allowances of all kinds in order to diminish the profits?—There is the check that the shareholders possess in open meeting.

20,213. But they are shareholders, too?—As a matter of fact this does not obtain in practice. It may be in theory that collieries are run by seven directors who are distributing large sums among themselves, but it is only in theory; it is not in practice; and it is really useless putting any question like that to me.

20,214. May I remind you that at least one-third of the 1,500 concerns are extremely small?—Of course, in theory it is quite possible, I suppose, for 300 shareholders to become directors, and all give themselves enormous salaries and share no profits, but those sort of things do not exist, and it is only in imagination that they occur.

20,215. Thank you. I am glad to hear that testimony to the honour of business men. Now take another point. There is to be a standard rate per ton to be adequate for the minimum return of profit in redemption of owners' capital?—Yes.

20,216. How do you suggest that the rate per cent. should be arrived at?—That should be arrived at by the accountants.

20,217. Pardon me, that is a very important question. Do you suggest that the accountants should decide that the rate of interest should be 5 per cent., or that the rate of interest should be 7 per cent., or that it should be 9 per cent.?—That is the proposal.

20,218. Are you really seriously contending that the whole of the colliery proprietors will leave it to their accountant, in conjunction with the men's accountant, to decide what the rate of interest will be?—I think that is the best way in which you can secure, for the capital which is sunk in a speculative industry of this kind, a fair return, having regard to the whole of the circumstances, because these accountants who would be appointed are men of the highest probity and standing with a very wide experience of all other industries, and they can arrange what is to be a fair percentage at any given period in connection with a return on capital so invested.

20,219. You remember that this percentage on capital plus the share in the margin over and above it will represent the whole of the employers' profits?—That would be so.

20,220. You are proposing, on behalf of the Mineowners' Association, that you are prepared to allow that rate of return for your capital to be determined by this honest accountant?—That is the proposal.

20,221. That the accountant is really authoritatively to settle what profits the mine-owners shall in each district have?—Before he gets his percentage.

20,222. That is an interesting statement. I should like to know whether the mine-owners have quite thought that out, because you do not say that here. I am glad to learn that it is so, that the two accountants, the accountant representing the workmen and the accountant representing the employers, I suppose subject to the arbitration of the Board of Trade, are going to settle what shall be the annual return in the way of profit to the coal-owners of the whole district. Is that the proposition?—That is my interpretation of what the scheme states.

20,223. It is a startling proposal; I am glad to hear it. But now a further difficulty arises: the accountant will settle whether 5 per cent., 6 per cent. or 7 per cent. is a fair rate. On what nominal capital is he going to settle that? How are you going to arrive at his capitalisation of the firm? The accountant will, I suppose, have to take the figures which the firm supplies him with?—The figures of what?

20,224. The capital value. What is the capital value of the concern?—That is, of course, one of the most difficult questions that can be raised, because the accountants themselves cannot undertake to say exactly what is the capital invested in the colliery and compare it accurately with the capital of another concern. The basis of our system is a tonnage basis.

20,225. Pardon me! Let us assume that Pease and Partners raise 10 million tons of coal. You cannot make your tonnage basis till you have two things: one, what rate the accountant will allow your fair profit or interest on, and, secondly, on what annual sum he will calculate that rate. Therefore, if the Mineowners' Association bring forward this scheme the Mineowners' Association must have some idea how the capital value is to be settled?—It will be settled on the basis of tonnage.

20,226. You mean the nominal estimate of 10s. capital per ton raised?—Or some basis which the accountants find satisfactory. The 10s. was to my mind an arbitrary figure fixed some years ago, and my own view is that that 10s. is to-day quite inadequate as representing the capital value of a concern based on a tonnage system.

20,227. You will remember that 20 years ago when Sir George Elliott wished to induce the mineowners to come in he endeavoured to tempt them by offering them 15s. a ton?—I saw the scheme at the time.

20,228. Are you suggesting that some such scheme as that should be put up—that you are going to arrive at an arbitrary figure of capitalisation based on the tonnage raised, and that it is upon that that

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

it will be reckoned?—That seems to me to be the only practical way of doing all-round justice.

20,229. Then you suggest that the two accountants should settle what this annual figure shall be?—Yes, they will determine it.

20,230. Really, this is more and more interesting. The Mineowners' Association are offering to put their whole plant, machinery, and mines in the pot, as it were, district by district, on a valuation to be set upon it district by district by two accountants, and with a return per cent. on that nominal valuation, which these two accountants are to fix. Apart from any facts, they are to arrive at this from their general knowledge of the industry. Is that so?—That is so.

20,231. Do you mean that each separate concern would have a separate valuation, or would it be a common figure for all the concerns?—I suppose the accountants would agree upon a figure for each concern.

20,232. A separate figure?—That it is for them to determine. It is for the district as a whole.

20,233. When you say the district as a whole, does not that imply a common figure for all the firms in the district?—I think there may arise in the development of the scheme differences which may hereafter have to be adjusted. No scheme that I have ever heard of contains provisions to cover every possible criticism, and certainly never secures the filling up of all holes which subsequently in experience actually occur.

20,234. This is the price which you are to be credited with in the books, as it were, for your property?—Quite so—upon which we get a percentage interest, and a redemption of our capital.

20,235. That is the price which you are to be credited with for all your property in the concern, and you are going to leave that to be settled by two accountants on their own view without having settled in your mind whether you propose that it should be a common price in proportion to tonnage for all the concerns in the district or whether it should be a separate price in proportion to the enterprise?—These details, no doubt, would have to be considered jointly with the accountants and possibly with the men.

20,236. You are now suggesting that the men should go into this partnership without having these things settled?—I am proposing that the men should have exactly the same confidence in the substantial firms of accountants that they appoint as the mineowners on their part are prepared to give the accountants whom they appoint on their side.

20,237. You lay stress on that word "confidence"?—Yes, I do.

20,238. I do not want to be derogatory; but you remember what "confidence" means in the Police Courts? It means the confidence trick. I am putting it in your interest?—I have a high opinion of the leading firms of accountants. I am taking firms like Price, Waterhouse & Co., Monkhouse, Goddard & Co., and firms of that standing, whom the Miners' Federation may appoint to deal with their interests just in the same way that we may appoint Messrs. W. B. Peat to deal with it on our side; but to suggest to me that those firms are not going to deal fairly with the men, just as the accountants will deal fairly with us, I think is a reflection which ought not to be cast by a person of your standing, Mr. Webb.

20,239. You misunderstood me altogether?—You suggested the confidence trick.

20,240. It was not the accountants I was referring to. I was referring to the character of the mineowners' offer, that they are inviting the men to forego certain rights, and to come into a new arrangement, and practically it is not yet settled how the capital is to be arrived at, how the percentage of profits is to be arrived at on that capital; and consequently the whole basis of the scheme is nebulous; it means a blind pool?—Not at all. These accountants are the most competent men the country can produce, and to their decision will be left the determination of these matters in our common interest.

20,241. The accountant is a highly expert person, and I have the greatest confidence in him in his sphere, but it is not a question of accountancy that

you are asking him to determine. It is a question of policy—whether you should be allowed 10 per cent. on a million or 5 per cent. on half a million. You are asking the accountant to determine that?—He knows the rate of interest which is obtaining in the financial markets of the world, and it is his business to determine a rate of that kind. I believe—at least we suggest it to you—that no better authority can be secured for determining a matter of this kind.

20,242. Very well; we will leave it at that. Of course, there is an interesting arrangement of this character called the Gas Clause arrangement for Gas Companies' profits. I should like to draw your attention to the fact that if the men's remuneration is partly to depend on the rate of interest, and the nominal amount of capitalisation, as it will under your scheme, it will be very important to them that all new capital shall be raised in the most economical way. You are aware, no doubt, that a gas company is not allowed to issue new capital except on the most advantageous terms?—Yes.

20,243. It would necessarily follow that the same sort of restrictions would have to be put on the colliery concerns?—I do not see that there is any analogy between the two.

20,244. Let me imagine your scheme to be in operation, and imagine that one of the concerns wanted to add new capital?—Obviously for the purposes of development.

20,245. There are two ways of raising that capital, let us say. They might raise it from the existing shareholders on very onerous terms. That is often done. Or they might raise it in the open market—borrow it on debentures, on the most advantageous terms. It would pay them to raise it on the less advantageous terms and share it with the shareholders, but it would not pay the workmen. Do you not think that there ought to be some security in an arrangement of this sort that the capital should be raised on the best possible terms?—It had not occurred to me that there was any abuse crept into the raising of capital in substantial colliery firms in the past.

20,246. Have there not been bonus shares issued? Have there not been shares issued below the market price?—Not to the detriment of the workmen.

20,247. At the present time you are not in partnership with the miners; but the suggestion is that you should be in partnership with the miners and that they should have as much claim and right to profit as yourselves. Clearly the arrangements that you may make when you are not in partnership with anybody cannot be the same as the arrangements which you would be permitted to make if you were in partnership with somebody else?—I do not think the abuse would be likely to arise. If it did arise, it would be time enough to deal with it.

20,248. At present you are asking the miners to come into partnership with you, and you are not offering them any share in the scheme of how the capital should be raised?—That is so.

20,249. When you arrive at the profits, how do you propose to deal with the question of the price of the commodity, of the coal, when it is merely a price between the two departments of the same firm? For instance, as you know, there are the iron and steel concerns which are also colliery companies. Would it not be to the advantage of the concern, if they have to reckon the profits on the coal, to charge a very low price for their coal to the other departments of their concern?—The accountants would have to agree what is the fair value to attach to that.

20,250. The accountants would have to control the price?—No; they would take the price, if it was arbitrarily fixed so as to secure an unjust ascertainment, and they would have to adjust it so that that coal should be charged at the fair market price of the day for the purposes for which it was required and so entered in the books of the company.

20,251. That is to say, the accountants would not be bound to take the fact that such and such a price was charged, but they would have to enquire and put down what they thought the right price?—Yes.

20,252. May I suggest that that applies to other cases too; I mean with regard to all sales. How are the men to know that you are not selling unduly

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

cheap, for ulterior purposes, for instance?—As I have said yesterday, their only check upon the commercial actions of the concern would be through securing a representative on the directorate, if they had not got one already.

20,253. They could not, by having one member on the board of directors, control the operations?—No, they cannot control until they appoint a majority of the directors.

20,254. You do not propose to allow that?—Certainly, if their shareholders elect them.

20,255. For the moment it is not part of this scheme?—It does not preclude there being representatives on the board.

20,256. What I am asking is this: Here is a partnership in which you are asking the workmen to go in; I am only looking at it, so to speak, as a business adviser. I want to know what protection the workmen would have at each one of these points, and you are saying that they have no protection at all?—I am saying that the workman has to accept the scheme as a whole, which we believe is as good a workable scheme as can be put forward.

20,257. When he asks what protection he has against selling at any price which it might suit the directors to sell at for ulterior reasons and thereby give away part of his profits, the answer is, he has no protection?—He must assume that they are going to do their duty properly.

20,258. The directors might conceivably be incompetent?—Quite so, and then the shareholders ought to get rid of them.

20,259. Can the workman get rid of them?—Not except as shareholders.

20,260. You are asking one million workmen to go into partnership with the 100,000 shareholders, and I am asking you what protection you are giving the workmen against either incompetence or malpractices?—The check is not with the workmen.

20,261. Then the workmen are to go into a blind pool?—They get the first plums: they get their wages.

20,262. *Mr. R. H. Tawney*: Is not part of the workmen's income under your scheme to depend on profits?—Yes, and the assumption is that the directors have as much interest in securing a margin of profit as the workman, and they both work together with that object.

20,263. *Mr. Sidney Webb*: Apparently the workmen are not to have any control over the selling price. That you are clear about. Is that so? I am only anxious to know?—Except indirectly through their work in the colliery.

20,264. They are to have no control over the selling price which will be fixed by the directors?—That is the proposal.

20,265. How about depreciation? Before the profits are ascertained, a certain sum would be set aside for depreciation: who is going to settle that?—The accountants.

20,266. That will be left to the accountants to decide how much ought to be set aside?—How much ought to be set aside for redemption?

20,267. I did not mean redemption?—You mean depreciation of machinery.

20,268. Surely that is the sense in which the word is used?—There are so many kinds of depreciation.

20,269. I think I have some acquaintance with this. Let us take the word "depreciation" in the ordinary orthodox sense of the depreciation of the capital invested, the plant and machinery, the enterprise, the lease, the depreciation of the enterprise. If there is any other meaning of the word "depreciation," I am not acquainted with it?—There is a depreciation which is permitted by the income tax authorities in connection with machinery.

20,270. I am talking about that?—That is quite a different depreciation from that on the capital which is sunk in a colliery which has to be redeemed before a certain period.

20,271. That is called redemption?—You may call it redemption.

20,272. No, pardon me, you did?—I called it redemption to make it clear to you; as a matter of fact, we call it depreciation.

20,273. Now may we take depreciation in the ordinary sense. Who is going to settle the amount to be

set aside for depreciation?—Again, these questions in connection with depreciation will all be determined by the accountants.

20,274. You mean that the accountants will have authority, not merely to take the item in the books put down as depreciation, but is to settle how much ought to be there for depreciation?—If he thinks the item is not a fair record.

20,275. Of course it is a fair record of facts, but who is to settle a question of policy?—The two accountants have to settle whether these items are all fair. You cannot leave to one coalowner an arbitrary depreciation unchecked by anybody in a case where an aggregate figure has to be obtained.

20,276. Therefore, the two accountants not only settle the aggregate capital to be credited to the owner for his property: they will not only settle the rate of interest which ought to be allowed upon that, but they will also settle all the items that have come into the profit and loss account, and they will fix in their own knowledge how much ought to be set aside for depreciation. Now we come to reserves, which is not the same as depreciation. There will have to be reserves. Will it be reasonable for an owner to set aside anything for reserve, or will you leave that to the accountants to settle how much should be set aside as reserve?—The reserves which I had in my mind are reserves which are the result of the profit, and come out of the item of profit. Again, if there is any question of diminishing the margin of profit which is to be divided between the men and the owners—

20,277. The whole of the profits have surely to be divided?—The profit between the items of the cost of production—

20,278. The whole of that will have to be deducted?—Yes.

20,279. In arriving at that profit, would you set aside anything for reserve?—Again I should leave that to the accountants.

20,280. Then there is a further item of development, which is a constant item in a colliery, I suppose, and it can go on at a greater or lesser rate. Do you charge any of that development expense to profit and loss?—Again that is an item which will have to be determined by the accountants.

20,281. You leave them to determine the policy?—Yes.

20,282. First of all, you are placing the owner under a great disability, but that is part of the scheme: they are to be placed under the rule of the accountant with regard to all their finances. In return for that, they are to be put in the position, I think I may say, of practically cumulative preference shareholders, because I gather, if in any one year the rate cannot be paid, the deficiency is to be made up in subsequent years from the profit?—That is the proposal.

20,283. That is practically the position of the cumulative preference shareholder—what may be called a cumulative dividend?—Yes.

20,284. That will be done district by district?—Yes. It is proposed that this shall be done by each district separately.

20,285. Each district will stand by itself?—Yes.

20,286. After that, what is left of profit will be divided between the workmen and the employers?—Yes.

20,287. I gather not equally, but in proportions to be agreed?—To be agreed.

20,288. Agreed by whom?—If we can agree among ourselves, so much the better; if not, we shall have to determine how it shall be fixed.

20,289. By an independent chairman?—That is one of the ideas we have. It might be done by the Conciliation Board.

20,290. In the last resort it might have to be done arbitrarily?—It might, if we cannot agree.

20,291. The next question is, the workmen going into this will need a great deal of protective clauses which have not been worked out, but when they do that, they are not protected against a fall in wages. I gather from time to time you have an increase in production out of proportion to the demand. It may be that the demand falls off. Is there to be any restriction on the placing of new capital in the industry?—That has not been suggested.

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

20,292. Let us work that out. After 1900 I think there was a great rush of new capital into the coal industry generally; products went up and prices came down?—There have been great fluctuations, of course.

20,293. Have you known years in which too much capital was put into the coal industry, in fact so much that it became unremunerative?—For a certain period.

20,294. That is my point. Consequently when the workmen and the owners are partners, the workmen will be vitally interested in the rate at which capital is put into their industry?—No doubt.

20,295. When times are good, there will be a rush of capital put into the industry that is permitted by this scheme?—There is no provision to check it.

20,296. Consequently there may be over production?—These things adjust themselves very quickly in the coal trade.

20,297. Pardon me, they do not. We have figures before us showing that you have had 5 or 6 years of bad trade, if you call that "very quickly"?—The production, no doubt, does increase steadily for many years, and the production may be stayed for others, but as a matter of fact there has been a steady increase in the production, meeting national necessities.

20,298. We are aware of those figures?—You have all those figures before you, but I agree with you, there are fluctuations of the enterprise owing to supply and demand, which have a wholesome influence on the trade.

20,299. What influence would it have on the workman's income? He has to get a minimum wage and to rely on his share of the profits?—I am afraid the percentage of the workman under our scheme would fluctuate, as it has done in the past, and we are not proposing that it should not.

20,300. The proposal is that the fluctuation should be at your option, and not at that of the workmen?—It would be at the option of circumstances in the industry.

20,301. Whether Pease and Partners put new capital into the industry is not the circumstances, it is their decision?—Yes.

20,302. Their act will have an influence on the workmen's income. Are the workmen to have any influence in deciding that?—It is not proposed.

20,303. Therefore the workmen will run the risk of suffering a lower income under circumstances over which they have no control?—If the directors are going to mismanage their concern, of course, ultimately there may be no employment for the workmen at all.

20,304. It might suit the employers to play for the future. Cannot you see that it might suit the shareholders to increase the capital value of their concern rather than to divide the profits, and it might suit the workman not to increase the capital value?—I could imagine this in theory, but not in practice.

20,305. You have never experienced this? this is a new proposal?—I know what the theory is, and I know what the practice is.

20,306. Now, going on to the co-operation of the workmen and the owners, you say that machinery should be set up for the purpose of arranging all questions between the owners and the workmen. Did you mean by that that the machinery should enable the owners and the workmen to decide?—We have no difficulty whatever in arranging matters in our various districts. I have already explained to the Commissioners to the best of my ability how we worked in Durham, in reply to some questions that Mr. Cooper put to me, and I believe that that kind of machinery which now obtains will obtain in the future to the best interests of the men as well as ourselves.

20,307. You have altogether a Workmen's Compensation Committee, you have a Disputes Committee and a Joint Committee for the Pit, you have a Joint Committee for wages questions, you have a Local Wages Board under the Minimum Wages Act, you have a Conciliation Board for arriving at the wages, you have a Request Committee—that is about eight separate committees, and, as I understand, on every

one of those committees the workmen have an actual voice with the owners in deciding the questions to which they relate?—Yes, and an arrangement is made as to what is to happen in the event of their failure.

20,308. They are not merely advisory committees, they are executive in their respective spheres?—Yes, according to the rules we have laid down.

20,309. On all these matters you have joint control?—Yes, we have joint control on all these matters.

20,310. When you say that machinery should be set up for the purpose of arranging all questions between the owners and the workmen, you meant by that word "arranging" deciding?—Yes, decisions are arrived at—

20,311. They are arrived at?

20,312. *Mr. Justice Sankey*: I should like to hear the end of your sentence as well as the beginning?—I am interrupted so often.

20,313. *Mr. Sidney Webb*: I asked you what was the meaning of the word "arrangement," and then you referred me to a series of Joint Committees. The series of Joint Committees decide questions within their respective spheres. I want to know whether you meant by the word "arranging" deciding questions?—They come to decisions themselves; if they fail there is other machinery to arrive at a decision, so as to settle any differences which have arisen at these joint conferences.

20,314. Then subject to provision being made for settling differences between the two halves of the joint body, the joint body is entitled to decide the questions which come within its sphere?—Yes.

20,315. You said that machinery of that sort "should be set up for the purpose of arranging all questions between the owners and the workmen?"—Yes.

20,316. That means deciding those questions?—Deciding all those questions.

20,317. Consequently you do allow a very large sphere for what has been called "joint control"?—We allow every possible power under the scheme to the men except in connection with the executive control of the mine, which I alluded to at some length yesterday.

20,318. Then you also go on to say, "Provision for the owners and workmen conferring on all matters of particular or general interest relating to safety," &c. I understand you do not want any interference with the executive, except with regard to safety?—No.

20,319. Are the workers only to confer on those points?—They will have no power in connection with the executive action, but they will have full opportunity of having all their representations fully considered.

20,320. Those eight committees I have referred to, which I have read out to you, have executive power?—If any of the matters to which their welfare relates are matters which come under the rules and regulations in connection with the matters which can be raised, then they will be settled under the machinery which I contemplate.

20,321. I am endeavouring to get at your meaning, and I think I do understand that you believe in the advantages of "joint control" and "executive power" for all those matters which already exist?—Yes.

20,322. But you do not believe in it at all for anything else?—It is a matter of future arrangement in connection with some welfare matter; it is possible it might come within the purview of the regulations which are part of the machinery.

20,323. You here say definitely, "This machinery should consist of the establishment or continuation where already established of Joint Pit Committees or other consultative local committees without executive power?"—"Without executive power."

20,324. As a matter of fact, eight committees have "executive power" now; do you mean to withdraw that?—No.

20,325. Then these words, "without executive power," have reference only to safety? I am trying to understand it?—If you mean that the men should have in connection with their "welfare" a power to

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

compel a certain class of house, we will say, to be built, that would be excluded from the purview of this scheme.

20,326. That is an instance?—That is an instance. "Welfare" is a very wide word.

20,327. I am not asking you about welfare in particular; I am asking you how far you object to joint control?—I say under the limitations which exist in connection with the rules and regulations agreed to, and as regards the various matters which go before each of these tribunals.

20,328. Is not that what I have been putting to you, that you are in favour of joint control where it already exists, but you do not propose to extend it?—Up to the point which has been agreed between us.

20,329. You are not proposing to extend it?—We are not proposing to do so.

20,330. I ask you would it be unfair to say you are asking the workmen to give up their present arrangements for a set of arrangements foregoing the advantages they have got, and entering into a partnership district by district with the owners under which they would have no control over the capitalisation, no control over the rate of interest, no control over the selling price, no control over the policy of the concern, and yet their remuneration would depend on that policy?—We think that is a better system than that which at present prevails, in which the men only have an interest in securing a high price against the consumer by being paid a percentage on the prices realised.

20,331. Regarding it as a partnership, could you as a solicitor, for instance, whom the men came to consult, advise them that their interests would be safe under it?—I should say they would be much safer, and the common interest would work to their mutual benefit.

20,332. Not the men's mutual benefit?—Certainly, the men's mutual benefit, as they would all have an interest in increased production, which they have not at the present moment.

20,333. They have an interest in profit, but the profit does not depend on production. Many of the years in which the production has been greatest have been years in which the profit has not been large?—It depends on whether you are speaking of production per man or the production in the aggregate. Now I am out for production per man, because if you get an increased production per man you will undoubtedly diminish cost, and give the man an incentive to work which he never had before.

20,334. You do not show me how that is necessarily going to be reflected in the net profits?—If you reduce the cost of production you widen the margin between production and cost.

20,335. You have explained to me that that is given away to the consumer?—The price to the consumer, as you know well enough, really depends on demand and supply.

20,336. Pardon me, I do not think that is so?—It has an influence.

20,337. But you have not shown that the miners under this scheme would have any incentive whatever to increased production, because you have not connected the increase in production per man with the increase of the share which they would get in profit. If I had to go to a miners' meeting and had to explain to them that if they put their backs into the work and turned out more per shift they could rely on that being reflected in the actual profit in the district which the miners would share in, I could not explain it to them?—I think you could.

20,338. Perhaps you would explain it to them?—I think they would accept the case that if they are going to share in the benefit that is derived from a reduction of cost—

20,339. They are not?—You might explain it to them in a different way. I think I should be quite fair in explaining it to them, that if they are going to share in the advantages by any diminution of cost, they would be able to understand it with their intelligence.

20,340. All this scheme does is to give them a share in the net profit, which has no necessary con-

nection with the production per shift?—On the other hand, I assert positively that it has as direct an influence as it can positively have on the production.

20,341. And you are asking the men to have confidence?—I have no reason to believe that they have not.

20,342. I say you ask the men in this scheme to have confidence in you?—Certainly.

20,343. Then we will leave it?—Thank you.

20,344. *Sir Arthur Duckham*: You were mentioning in your evidence the question of Government salaries, and you were saying that the salaries paid by Government would not be conducive to ordinary people coming in and working for the Government. The question I want to ask you is whether the Government salaries, some of them, are adequate?—In my opinion, the salaries paid in Government Departments to-day are wholly inadequate.

20,345. Is there not a tendency in Government Departments to get a levelling of salaries?—It has been found in practice practically impossible to devise any scheme except one based upon grading—that is to say, you pay the man for the work which is given to him rather than the work which he necessarily performs. In other words, each man is paid in accordance with the class of work which he does in accordance with the grading in the scheme.

20,346. I presume that the various men would get their increases of salary for that grade by time of service and not by merit?—Yes; under the Civil Service terms, sometimes every year, sometimes after the lapse of a few years.

20,347. He does not get increment by merit?—No, he does not get increment by merit. He gets increment by continuation in the service of the State.

20,348. Have you found in your work in the Government very much difficulty in obtaining special salaries for special men?—I have always found great difficulty in securing increased salaries for special services. I have secured a certain number, but with the utmost difficulty, on account of the Treasury fear of creating a precedent which is going to involve them in very heavy expenditure in other Departments which may press for special service for certain of their officials.

20,349. In your *précis* you speak of the defects in the present system. I would like to ask what, in your opinion, these defects are?—In the present system, I think they are divided into the two chief categories of the remuneration of labour being totally based, as it hitherto has been, on the selling price of the commodity which is produced, and the defects relating to the difficulties which are placed upon the colliery owners of working underground in the most economical manner through provisions inserted in the various leases which he secures from the royalty owners.

20,350. You consider there is trouble from the royalty owners; the colliery owner has trouble?—In isolated cases; I have known an obligation, for instance, for a shaft to be put down, in a royalty, which was obviously, from the mining engineer's point of view, not the best place for the shaft to be sunk for the development of minerals.

20,351. Is the percentage of those cases sufficient to affect the industry as a whole?—No, because the amount of coal which is capable of being worked is so large that in a very short time the necessities of the public are made up by coal which is produced from some neighbouring place in the event of any one place being closed.

20,352. You do not consider then that there are other defects such as the co-operation with regard to working an area? You do not think we have been troubled very much with regard to that?—I think there are cases where some coal has been worked to some shaft under the provisions of one lease which might have been more advantageously worked to another shaft, but which it was impossible really to secure owing to the way-leaves which would be imposed and possible barriers, which, under the lease, might be left between the two different areas.

20,353. What I was asking was the possible defects of collieries not working together for the mutual benefit of the collieries?—I have come across no cases

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

of that kind, unless it be in connection with pumping arrangements. It is quite possible that even in South Durham if all the engineers had met together and arranged for one pumping plant at one particular place some economy might have been secured. There is always a danger of leaving water to find its own resting place by gravitation, and a colliery may be prejudiced by water-bearing stratification and fissures enabling water to pass from the higher seams to the lower, and so on; but there are pumping operations, for instance, in the Rotherham district where colliery owners have joined together in order to unwater a large number of collieries which are working different shafts by common arrangement.

20,354. Would you be in favour of some steps being taken or some measure being passed by which this co-operation between the mines was enforced?—Yes, and I believe a sanctioning committee, such as has been suggested in the scheme, is the tribunal which should be given power to compel the pumping arrangements to be conducted in the most economical way for the production of the coal in a given area.

20,355. Now, just one word with regard to the poorer collieries: Do you see how these poorer collieries could be assisted by their better-conducted brethren or their richer brethren in the neighbourhood in order that they might be brought up to a definite standard for the output of coal?—It is one of those difficult problems which have always engaged one's attention, and which always continue to engage one's attention. To me it seems to be impossible for us to arrange any scheme which is going to support for very long a colliery which is what I regard as below the margin of cultivation, with a view to prejudicing those that are above. As a matter of fact, very few coal seams ever got lost from not being worked, and if a royalty owner or owners of what is regarded as a poor colliery in a given period cannot work the colliery at a profit, the colliery is laid in in such a way as the colliery can be opened if later on the circumstances of the time would enable it to be worked; or another thing occurs, that arrangements are made by which the profitable portions of that coalfield may be developed and worked to some other area which is adjacent thereto.

20,356. How would that work; say you had an area like the Somerset area or the Forest of Dean area, or the North Stafford or North Wales; if all those areas, taken as a whole, are unprofitable, how are you going to meet that case?—Speaking of any given area, you will find a certain number of collieries on the margin of cultivation at any given period, and so it is with the whole country: there are areas which at certain given times, owing to a temporary depression in the trade of the country, where the districts cannot compete with the other districts, and my idea is that those districts will always have a certain natural protection in connection with their own area. They have advantages in connection with transport which enable them to be given a natural protection which will always secure for them some trade, and I do not think any of those districts under any conceivable condition in the industry will be entirely wiped out.

20,357. You have a large number of them which at the present time are being threatened with being wiped out?—They are, because at the present time we are all in the same position, that the cost of production is now exceeding the selling price that we are able to obtain for the aggregate coal that is produced from the collieries.

20,358. *Mr. R. H. Tawney*: May I ask, how long has it been that the cost of production has been exceeding the selling price?—It has been going steadily back this year.

20,359. It was not the case last year, was it?—It was certainly not the case in September of last year; I should say that since September the cost of production has been steadily decreasing while the selling price has been receding, or at any rate has been stationary.

20,360. *Sir Arthur Duckham*: With regard to this scheme for paying the bonus, or the profit-sharing scheme with regard to the workmen, you state here that "These additions to the standard rates of wages in each district would vary in accordance with the variation of the profits shown by each periodical ascer-

tainment in such district." That means to point to a pooling of the district profits as a whole?—Yes.

20,361. Does that not seem to tend to a unification of the interests in that district?—In connection with profit-sharing arrangements between the owners and the men.

20,362. For instance, you have one colliery which is a very well-run colliery, where there is good feeling existing between everybody concerned, and that might be making a very large profit; would not the workers in that colliery have a proper grievance if they had to have their share reduced by a badly managed colliery where there is not that good feeling and there is bad working?—Undoubtedly that is so; but on the other hand, they would obtain the best results from a large colliery where there was very good working.

20,363. Would not those men feel that they were doing their better work for the benefit of other people?—Do you think that would be acceptable to the men; would there not be trouble arising from that?—I think they would have to take the rough with the smooth, under a system of that kind. They must regard the work as a whole for the district.

20,364. I presume that this profit-sharing would go beyond the workpeople. Could you not imagine the workpeople and the others concerned grumbling and being discontented?—I have no doubt they would; and some of that discontent, if it were well founded, would be an element to help to remove the cause of the discontent.

20,365. I do not see any powers here by which they have an opportunity of removing the discontent?—No, they are not given a control in the mining operations.

20,366. Would you consider that any unification in districts would assist this scheme, I mean of the private interests of a district?—I am afraid you would get rid of the competition between individuals in a district, which in my judgment is the greatest incentive to economy and to up-to-date work in the collieries.

20,367. Would you not get your competition between districts?—No, because each district, to a very large extent, has its natural production in connection with its supply area.

20,368. Let me put this to you: Take the gas coal supplied to London. There is a distinct competition in the London area between Durham and Yorkshire in order to secure custom for the coal?—Yes.

20,369. My friend, Mr. Cooper, says, No, no; but I have been in the position of buying, and I know the competition that there is existing?—I am not very well up in the gas trade, because my firm has never sold, or has practically sold very little, coal ever for gas producing to the gas companies.

20,370. There is competition between the districts?—I think there is competition between districts, and natural competition.

20,371. But you do not advocate the unification in districts of the private interests?—No, I do not: I am rather afraid that the disadvantages are greater than the advantages.

20,372. With regard to these proposed colliery joint advisory committees: it seems to me that some of the subjects you have here for discussion are rather bigger subjects than should be dealt with by a pit committee; I mean, for instance, the question of safety lamps: surely that is a big subject?—It is a subject which certainly can be dealt with, in my judgment, by pit committees. The ultimate decision, however, as to which lamp should be accepted must, I think, rest with the management.

20,373. That is the point: do you think a pit committee could properly discuss these larger questions? They might express an opinion, but what I want to ask you is, whether you do not contemplate a committee of this type in a bigger area outside the pit committees for similar subjects?—No. I think the differences in the mining conditions between one colliery and another are so great that each case ought to be considered, such as you have described, by the pit committee of the colliery.

20,374. Then you would not consider that a larger committee in similar areas or districts should be appointed?—I cannot call to mind any particular

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

case where an advantage would accrue by joint pit committees. I am not averse to the idea if you can show me that there is really any advantage in it; but the men who are employed in any one colliery are so cognisant of all the conditions of that colliery, and are not aware of the conditions in another colliery, that I do not see that there is very much advantage in the joint committees being amalgamated between two or three different collieries.

20,375. The collieries are not similar enough in the same area?—No, they vary enormously.

20,376. With regard to this committee, I see this committee reports to a colliery joint committee. Is that the existing colliery joint committee?—We hope it will be in our neighbourhood. We want a little latitude in connection with the arrangements in accordance with the wishes of the men and ourselves.

20,377. There is an appeal committee at the head of it?—Yes.

20,378. Suppose there was a proposed new work, and that the men's representative on the committee proposed a piece of work to be done in a certain way and the manager disagreed, they would have the right of reference to the colliery joint committee, and then to the county appeal committee?—I think they must agree as to the matters which may be referred to these various committees. In connection with the development of a colliery and as to the way in which the colliery should be developed, I think that ought to be decided by the management, and not by the joint committee. I am all in favour of anything that the workmen may think being fully stated and considered by the management, and that the management should have an opportunity of hearing the men's views on anything of that kind.

20,379. Conversely, should the management put before the workmen their views?—The more confidence there is between the management and the men, I think the smoother would be the operations.

20,380. Then your diagram here is not quite correct, because you would not agree for such subjects to go to the county or the appeal committee for decision?—In connection with the development of a colliery—

20,381. Or proposed new works?—or proposed new works which required expenditure of heavy capital, I think the decision must be taken by the management.

20,382. Then this diagram is not correct on that point?—This diagram is based on the practice which obtains in the county of Durham, and we have rules and regulations agreed between us as to the subjects which can be brought up to the committees.

20,383. So that in forming a committee you would have to lay down a schedule of what can be considered and what cannot be considered by the management?—That is so.

20,384. *Mr. R. H. Tawney*: I think you make proposals under three main headings: first, in the body of your report as to the distribution of coal, and then at the end with regard to the control of the owners of minerals, and lastly with regard to the relations between the employers and the employed. Am I right in thinking that you are in favour of the distribution of coal co-operatively to the consumer?—I have explained that I have no knowledge of the reason why there is so much difference between the pithead prices and the prices which some of our consumers in some of our towns have to pay. All I have said is, assuming there is an evil, I think the evil can be cured by co-operation; but I want to be satisfied that there is an evil. I have not sufficient data to say whether that evil does exist.

20,385. You leave it to us to find whether or not there is an evil; but if there is, you advise co-operation?—I think co-operation between small consumers is the way to prevent them being treated unfairly by any middlemen who come in between the coalowners and the consumers.

20,386. With regard to the proposals at the end of your report, what you recommend, as I understand, as the solution of the industrial difficulty is, I think it is fair to call it, a scheme of profit-sharing?—Yes, it is a scheme of sharing profits.

20,387. You are familiar, of course, with the very long history of these schemes of profit-sharing, and with the very many experiments that have been made?—Yes. I think my own firm's scheme has worked admirably with our workmen.

20,388. You know that these schemes have been investigated very elaborately by the Labour Department of the Board of Trade?—Yes, I know there have been investigations.

20,389. And you know that on the whole more than three-fourths of them have been a complete failure?—Most of them have.

20,390. I do not think you are a lover of theories?—I am a lover of the success which attends practice rather than the anticipated success which may attend theory.

20,391. What you are recommending to us is something quite inconsistent with the considerable body of practical experience which has already been obtained?—I do not think so. I think this scheme is calculated to obtain good results, better results than are obtained at the present time.

20,392. But perhaps, after all, I should not be rude in describing that as a "theory." As far as we know and as far as practical experience has gone, profit-sharing, which has now been tried for 50 years, has not produced, in the vast majority of cases, the results anticipated or the results which are anticipated by you here. That is a fact, is it not?—It is correct that there has been a failure from one cause and another.

20,393. Do you think that, in view of that experience, the miners can be expected to throw themselves into this scheme with any great enthusiasm?—I think when the miners realise, as I hope they may, that instead of being dependent on the selling price of coal for the percentage of profits added to their wages, they can secure a further increase in connection with the economy which can be secured in the cost of production, that will be an inducement to them to accept the scheme.

20,394. I put it to you that that is a prospectus which nearly every profit-sharing scheme has put forward, but that the results have nearly always failed to realise the prospectus?—In other industries it has not always been the selling price which has been utilised as an indication of the percentage which should be added to wages. In the coal trade it has been the one factor.

20,395. That is the factor that you are proposing to abandon, is it not?—No. In addition to paying rates of wages on the selling price, we propose for the first time to give to the men an added inducement, not merely to secure an increased price for the commodity which he hopes to obtain, but also an inducement to secure economy in production, and it is an added inducement while not changing the factor on which his wages have been partly based.

20,396. That is to say, it is the ordinary profit-sharing scheme?—It is based, of course, upon production and prices realised.

20,397. I suggest to you that it would have been desirable to consider the past experience on the subject. One cannot feel very optimistic about the schemes in the lights of what we know has happened?—I do not think the experience in shipyards and other places where it has been in operation is of any value whatsoever in considering what ought to actuate one in the mining industry.

20,398. Still experience, such as it is, is of more value than no experience at all. However, I will not pursue that. I understand from your proof that you think the proposal of the chairman and some other members of the Commission, which they have made in their last report, that the owners should receive a profit of 1s. 2d. a ton, too low?—I think that profit has not taken into account any questions which ought to have been under the purview of the Commission.

20,399. We used to be told by witnesses at the last enquiry that 1s. a ton represented 10 per cent.: is that correct as a rough calculation?—I cannot verify that.

20,400. If 1s. 2d. a ton is too low, you want the profit which is put as the basis of your scheme to be more than 1s. 2d. a ton?—One of the reasons is that

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

if there is only a profit of that amount, it stops all development. As coal has to be worked from deeper areas and deeper seams, it requires much more capital in the future to work coal than has hitherto been secured for it, otherwise you get no interest on the money, and you stop all enterprise and all development.

20,401. We have been told by a considerable number of witnesses that the average profit in the coal trade in the last 20 years has not been more than 9d. a ton. Do you, therefore, propose to start as a basis with an increase of 5d.?—I do not want there to be any limitation of profits arbitrarily arranged by the State. I want the enterprise and the development of the industry to be encouraged by leaving the industry quite free.

20,402. I put it to you that your scheme implies the establishment of a standard rate of profit. What I want to get at is what you think that ought to be. We know that you think it should be more than 1s. 2d.?—I think it should vary, and in the future I anticipate that anything like 1s. 2d. will not be an adequate remuneration for the capital which should be invested in the industry.

20,403. That is to say, you propose to begin, as the foundation of your scheme, with a great increase in the standard rate of profit. Is that so?—No. I think if there is to be any standard rate of profit it is most objectionable.

20,404. Is not the phrase "standard rate" your phrase and not mine? I understood there was to be a rate of profit which was to be the basis of the datum line. It is on page 28, paragraph 3, I think. However, I do not want to bether about precise words so long as we understand the scheme; and the scheme is to be that there is to be roughly a standard or basis or datum line of profit?—Yes.

20,405. Your proof suggests to me that you want that basis to be considerably more than 1s. 2d. a ton. What I am trying to do is to reconcile that with the fact that previous witnesses with experience in the coal trade have told us that the average rate of profit is not more than 9d. over a period of years?—There may have been periods where that accurately describes what was secured in the industry; but there are a great number of new factors which ought to come into the consideration of any body of individuals who have to decide questions of this kind in the future. First of all, there is a general increase in the percentage rate which money secures in any investment for the public in the financial world. There is also the case that more capital is required than has ever been the case before in order to secure the same results, and there is also the important point that I have tried already to make that more capital is required in the future in development than has ever been necessary in the past in order to secure the same output.

20,406. I am not disputing your explanation. Clearly, this may or may not be justified. I merely want to get at what you propose. I understand that the first item in your scheme for agreement with the miners and improvement of the relations with the general community is a large increase in the normal rate of profit?—I should leave that to the accountants to decide according to the position and situation of the industry and having regard to the times.

20,407. I put it to you that is what you propose here. With regard to this rate of profit, do I understand that supposing a firm does not earn the standard fixed in any one year it is to make up its profit in the subsequent year or years to that standard before it divides profits?—It is an average of the whole district.

20,408. Does that mean really a guaranteed profit?—It would mean a return on the capital before the profit is ascertained for the purpose of division between the men and the owners.

20,409. That is to say, there is to be guaranteed a profit per cent, or per ton, or whatever it is, over a period of years, and apart from that you propose that there should be no limit to the upward level of profit. Anything above that is to be shared with the miners?—That is the proposal.

20,410. Do you think really the proposal that in the first place there should be a guaranteed minimum; secondly, that there should be no guaranteed limit to protect the community—do you think that is satisfactory from the point of view of the public? Is it not a case of saying to the public, "Heads I win, tails you lose"?—Not any more than has hitherto obtained.

20,411. I am not disputing that; but I say whether it has obtained in the past or not, it is not a scheme which a public body like this Commission can lend its support to. Do you think we can support a scheme like that—that we should guarantee you a minimum, but that we should have no guarantee whatever against an unreasonable increase in profits?—My reply is so long as you have competition between districts and between the firms in any district the consumers will be able to obtain the commodity on terms satisfactory to the community as a whole, and the industry knows that it does not pay the coal-owner to ask a price for the coal which the industry in which the customers are engaged cannot afford to give.

Mr. Arthur Balfour: I should like to be clear; is it a guaranteed minimum whether the colliery earns it or not?

20,412. *Mr. R. H. Tawney:* It is to be a first charge on the district, to be made up in subsequent years?—The wages will be a first charge upon the whole district. The next charge will be the rate to be agreed upon on the capital, based on tonnage, which is to be given as a return upon the capital invested in the industry.

20,413. *Mr. Arthur Balfour:* May I interrupt you there? Supposing there is not enough money to pay that, nobody guarantees it?—Then the capitalist will go without any return on his capital.

Mr. R. H. Tawney: For that year. But before he shares profits with the workmen in the next year he has the right to make up the standard if he was below it in previous years.

Sir Adam Nimmo: The minimum wage being retained.

20,414. *Mr. R. H. Tawney:* Before the Miners' Federation have a right to press for any share in the surplus profits of a good year the firm has the right to repay itself anything it may have lost in bad years?—That is so.

Sir Adam Nimmo: The district?

20,415. *Mr. R. H. Tawney:* The district—that is to say all the firms. I do not want to press the word "guarantee," but it is in one sense a guarantee. It is a guarantee against this surplus being used to raise wages till the profit which was not made in the previous year is made up?—In other words, it is a provision to enable capital to be maintained sufficiently in the industry to give employment and carry on.

20,416. That is to say you are going to secure a living wage to capital over a given time?—You are going to give a return if the industry will afford it.

20,417. And above that you are going to give them a share in any profits which the trade may make, so that the community loses both ways?—The community, except through the shareholders, which will benefit by a division of profits, will have to accept the prevailing price of coal as they hitherto have done.

20,418. Now may I give a practical instance to see if we can understand exactly what this is? We had some figures put in some days ago with regard to the profits made in the September quarter of last year in the County of Durham. I think they relate to 42 mines. Of those, 19 were making a profit of between 3s. and 6s. 6d. a ton, 8 were making a profit of 6s. 6d. a ton, which were reasonably good profits, were they not?—They were under the control system by which the State secured the whole of those aggregate profits, and the profits did not go into the pockets of those who were making them.

20,419. I am not concerned with that?—But I am.

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

20,420. I suggest that you should follow my argument, and you can state your own views afterwards. Do you propose to maintain that system under which the State takes excess profits?—I think it is very demoralising to everybody.

20,421. That is to say you propose to abolish it. Supposing it had been abolished and you had your standard rate of profit fixed, say, at 1s. 6d., do you propose that in the case of collieries which were earning 6s. 6d. a ton the 5s., the surplus, should be divided 2s. 6d. a ton to the men and 2s. 6d. a ton to the colliery owners in the district?—I am not proposing any particular percentage of division of the profits. The profits would be divided between the men concerned in the production of the coal in the district and the capital which has enabled the industry to be carried on.

20,422. I am indifferent for the moment to the question of percentage, though it is a very important one. I want to get at this: supposing you found the profits to be 1s. 6d., and you had in 1918 collieries making 6s. 6d. a ton—that is a difference of 5s. Do you propose that that 5s. be divided in some proportion between the owners and the men, supposing your scheme had been in operation?—Yes; but it is a very big assumption, because in the circumstances which prevailed in September, which were quite abnormal, we were able to secure from the Neutral Powers an export price which varied from the consumer's price by many shillings. In normal periods of time, such as occur, the difference between the export price and the consumer's price at home can only be gauged in pennies. But under the assumption you make you are accurate in your suggestion.

20,423. There were collieries making as much as 12s. a ton. I do not accept—and perhaps you would not accept—that the profit made, abnormal as it has been, is quite unparalleled. Turn your mind back to the South African war. We were told by an eminent coalowner, sitting where you are, that the profits made then were larger. What you propose then is that any surplus should be shared?—That is the proposal.

20,424. Where does the community come in?—The community comes in by the natural competition which always exists.

20,425. Is that not really "theory"?—No: in practice it works out absolutely as I have indicated. Undue demands are not made on the consumer, because the different districts compete with one another for custom, and the different owners also compete with one another.

20,426. You are anxious to protect the consumer against the demands of the miners. You say, "In the interests of the country the coal industry must continue to be carried on under private ownership so as (1) to maintain personal initiative and enterprise and (2) to safeguard the interests of the consumer." You propose to do that by fixing the miner's wage?—Yes, and in many other ways, I believe the consumer is protected under our system that he cannot be under nationalisation.

20,427. You propose to protect the consumer by fixing the wages; do you propose to fix profits?—No;

by the higgling of the market and by mutual arrangement with the men we shall be able to arrange these matters.

20,428. I suggest that the consumer, if he wants protection against the workmen, also wants protection against the owners. You have made proposals for the former, but you have not suggested anything for the second?—He has the same protection that he has always had against the coal owner, and, considering the average interests that have to be considered over a term of years, I think he will see that the prices have not been unfairly raised against him in the past, and he will see that they are not in the future.

20,429. What figures have you in your mind?—I have in my mind all the concerns with which I have been closely associated.

20,430. You are speaking of the industry as a whole?—Speaking of the industry as a whole, I do not think the percentage which has been secured to the capital which has been invested is as good as that which has been secured in very much less speculative enterprises in the country.

20,431. That is why you want to begin by fixing a standard rate of profit?—The idea of fixing a standard rate of interest was to provide an essential advantage in the first instance for the industry and the men; they should be given a good living wage.

20,432. Do I understand that the object of fixing the standard rates of profits is, in the first instance, out of consideration for the men?—It is to make any scheme, as a whole, attractive to the men that they are guaranteed a substantial living wage.

20,433. Do I understand that, in order to attract workmen into the industry, it is necessary to raise the rate of profit?—I think that is always an inducement to good work.

20,434. Do you really mean that the larger the dividend you pay, the more attractive you make the industry to the workmen?—If he is going to secure a division of the profits.

20,435. Has it not occurred to you that if you make the workmen anxious to increase the profits and share in the profits with the owners, that the workmen may combine with the owners to exploit the general public?—I think the general public who consumes the coal will take very good care that they do not pay more for the coal than the industry in which they are engaged can afford to pay.

20,436. How do you suggest to secure that? You have suggested no protection whatever?—Because the consumer, as soon as you raise the price against him, declines to become a purchaser.

20,437. The ordinary household may go without a fire in winter, but is that a very satisfactory way of bringing the men and the coalowners to a sense of their duty?—It brings them very much up against the proposition that the whole of their livelihood depends on the output of coal and they will take care to supply at a price which the consumer is ready to pay.

20,438. Then the only remedy you propose is that there should be a consumer's strike?—That is it.

(Adjourned for a short time.)

20,439. *Mr. R. H. Tawney*: I need not trouble you much more, Lord Gainford. The practical possibility of introducing this plan rests upon its being accepted by the miners?—Yes. I think that unless it is also supported by public opinion generally—I base much more importance upon the public as a whole than upon one of the interests in connection with a matter of this gigantic importance.

20,440. The scheme is a scheme of profit-sharing. Supposing the miners do not want to join in the profits, you cannot very well compel them to?—The miners need not give us their labour unless they have some arrangement for their remuneration.

20,441. I see you say that if any scheme of joint control is introduced the owners will simply stand out of it. You will not play, so to speak, if you do

not have the scheme you like?—I do not think it will be possible to carry on the collieries for the reasons I have given.

20,442. Supposing the miners will not play if they do not have the scheme they like; have you anything to offer?—I always think in each district we are capable of making our arrangements with our own men for the benefit of the industry in the locality and have always succeeded heretofore in being able to do so, and in the event of no nationalisation arrangement being arrived at I should hope it would be possible for owners and men to agree upon the method of remuneration and employment in their respective districts.

20,443. This Commission has arisen out of the fact that you and the men failed to agree in this par-

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

ticular. Have you any suggestion as to what the basis of agreement should be supposing they do not accept your profit-sharing scheme?—We are not unreasonable individuals, if they have suggestions to put forward to us which we can entertain. We thought that this scheme was a real advantage in the interests of the men because it is based not only on the selling price but the cost of production.

20,444. Do you think so still?—I am quite sure of it.

20,445. Now there are one or two questions about the ownership of minerals. You are in favour of setting up a central authority to intervene in the case of mineral owners unreasonably withholding a right to work or obstructing the development?—Yes.

20,446. Are you in favour of leaving the private ownership of minerals as it is as distinct from mines?—Are you speaking in my own individual capacity, or as representing, more or less, the Mining Association of the United Kingdom?

20,477. Let us have your own individual opinion?—I have never been opposed necessarily in principle to the purchase of royalties by the State if a case could be made out, but, speaking from experience, I am satisfied that the trade is not suffering owing to the fact that we do negotiate our leases direct with royalty owners, just as it is being conducted at the present time. I make the stipulation that if that system is to continue we ought to have compulsory powers through a sanctioning authority in the way suggested.

20,448. You mean the present system of private ownership of minerals is not very inconvenient to you as a coalowner?—No.

20,449. What service does the owner of the royalties render to the community?—It is under the customs and laws of the country; it is his property just as much as the surface, which is still his.

20,450. That I quite understand. What I want to know is, if this is a good arrangement or not. Does he render any economic service to the mining industry?—You have had evidence from the royalty owners on that point. I do not think I have anything to add to it.

20,451. Have you not any opinion on the subject?—I think some royalty owners, because they derive money from their royalties, take a keener interest in the welfare of the men who are working, extracting the coal from the ground than they otherwise might do. Apart from that voluntary effort and interest which they take, they are perhaps influenced by the fact that they obtain a certain amount of income. I do not say they are doing any direct service to the country in respect of that property more than any other property they happen to possess.

20,452. The service they render is that some royalty owners take some interest in the welfare of the men. We pay some royalty owners £20,000 a year, and others £30,000 a year, and one £58,000 a year. Are not these rather expensive luxuries to maintain? I suppose if they were purchased by the State we should have to maintain the interest upon the purchase money, and, from that point of view, unless you are going to confiscate property without paying compensation from the nationalisation point of view, we are not losing anything by working under this system.

20,453. I understand the object of your profit-sharing scheme, or one object, is to increase the output?—Yes.

20,454. To offer the miners an incentive to produce more coal?—Yes.

20,455. Do you think he will have an incentive to produce more coal so long as on every ton he gets by strenuous labour anything from 6d. to 1s. is paid to the person who does no labour at all?—I do not think it has an influence, direct or indirect, on the amount of physical effort made by the miners when at work.

20,456. If a certain number of persons make large incomes without working at all, is not that a bad moral for other persons who are working? Might they not say: "Why should we work hard"?—It is exactly the same thing if a miner receives from some relative a large fortune and he has not to do any more work. It is very likely the miners alongside

of him may feel that it is rather hard they have to work, and, with regard to their more fortunate brother, there is no longer any necessity for him to work. It does not affect the amount of physical effort they put forward to secure a living for themselves.

20,457. It depends largely upon the state of mind of the miners. They are not merely machines. It depends upon how they think they are treated?—They are influenced by all sorts of emotions as everybody else.

20,458. As long as you pay a considerable sum to anybody who does not work you can pay more to somebody who does work?—It does not retard production.

20,459. It does not obstruct the colliery owner?—The colliery workmen.

20,460. Do you think it reasonable?—No miner I have ever come across who goes down the shaft is going to say: "I am going this day to work 2 tons 13 cwt. rather than 3 tons, because if I work the other 7 cwt. I am going to give a little more, a fractional proportion, into the hands of the royalty owners." He does not think of that when at the face.

20,461. I do not suggest he does. You have told us already the royalty owners render no service at all, except in some cases they take some interest in the well being of the workmen?—They contribute very largely to the revenue and to local taxation in many districts.

20,462. They contribute to the revenue; that is to say, we pay somebody £30,000 a year in the shape of royalties and we take back possibly half, possibly two-thirds in the shape of revenue. Why should we not take it all, if he does nothing?—Because it would be confiscatory.

Sir Allan Smith: Before dealing with the Witness I should like to draw your attention, Sir, to Section 2 of the Act, and particularly clause (d) of the first sub-section.

Chairman: With regard to punishing persons guilty of contempt?

Sir Allan Smith: Yes. My application is with reference to an article appearing in the "Daily News" of to-day, and I wish to ask whether you will be prepared to say to the Press that, although we show no desire as a Commission to restrict their activities or their privileges, still there are some things that it is undesirable they should do, and whether you will give a ruling as to the effect of Section 2 of the Act in the direction I have indicated. The article which is in the morning's "Daily News" and which appears in the form of a leading article or special reference, and which directly bears upon the evidence we have just been receiving, is this: "Lord Gainford put the owners' position in very definite form before the Coal Commission. They do not believe in nationalisation. They contend that it would be costly to the consumer, disastrous to export, and ruinous to certain industries dependent upon an economic coal supply. But, although they argue this, they are not opposed to nationalisation as a policy. On the contrary, they are for it." Then further down it says: "But the mine owners must recognise that it is their policy and tradition that have made the event inevitable"—that is to say, the nationalisation of mines. It may be the mines are going to be nationalised; it may be the royalty owners have to give up their royalty holdings, but our task as a Commission at the moment is quite sufficiently difficult, first, to arrive at a conclusion and, secondly, to convince the general public that it is well founded. It is sufficiently difficult without comments of this description, which I submit are unfounded in fact, and perfectly unjustifiable. If these are going to appear from day to day presumably educating the public as against the report this Commission may finally bring forward, it will be intolerable. I suggest it is only reasonable the privileges which this extraordinarily constituted Commission enjoys should be safeguarded. The only result I can think of which would follow any further proceedings such as these is that neither the public nor the Press shall be permitted to hear our proceed-

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

ings upon this Commission, I therefore suggest that it is wise at this stage that some notice should be taken of this article and some construction given with regard to the proper effect of Section 2 of the Act.

Sir Leo Chiozza Money: May I address you upon that?

Chairman: Sir Allan Smith is only drawing our attention to it. I have not seen the article. We have received very great assistance from the Press, because through the Press our proceedings have gone forth to the world. If I may say so, I think the Press are to be congratulated upon the very accurate reports they have hitherto given. I am sure they will take notice of what Sir Allan Smith says, and I do not think for a moment there will be further trouble at all.

Mr. Robert Smillie: I agree we should try and prevent this sort of thing prejudicing our judgment. Here is a circular which has been sent all over the country. I have had one sent to me in Scotland. It says: "State-owned Industry. This problem affects you. There is grave danger that the principle of nationalisation may be established by the Report of the Royal Commission on the Coal Industry, which is due on June 20th, before your views have been made known. Coal first, then ———? The industrial world must be heard on the issue. The coal consumer is entitled to ask: Will the State give the same individual service as the private owner? Will coal cost more? The industrial world can see that no snap decision is made. By writing to the Press. By appealing to their representatives in Parliament. By pointing out the danger on all occasions. Please send your views, or apply for information to: Mr. Philip Gee, General Buildings, Aldwych, London, W.C. 2. From the evidence of the Duke of Northumberland, they (the Miners' Federation) are only in for this scheme as a step to something far worse, something far more revolutionary. The confiscation of all land. It is only an expression of opinion, but I think they want to control the sources of production of all industries. I think they want the complete control of the coal industry for themselves." Sir Allan is justified in calling attention to the newspaper article, but surely this sent out by private individuals is far worse. One wants to guard one's self against such things.

Chairman: I am very much obliged both to Sir Allan Smith and Mr. Smillie for drawing attention to this. We must recollect the public are very interested in this scheme which concerns the whole of them. Personally I find some of them helpful. Perhaps it is good at times to see yourself as others see you. I am sure the Press will do all they can to assist us and not embarrass us. I am much obliged to those two gentlemen for bringing this forward.

Sir L. Chiozza Money: I did want to say, as Sir Allan has raised this matter, that I am inclined to agree somewhat with what Sir Allan says. On the other hand a very large number of articles on the other side have occurred in a great many papers, and in addition to that there is evidently a great deal of money being spent by some person or persons unknown in circulating pamphlets. This was given me at the door and one was given to each person approaching the King's Robing Room.

Chairman: You are lucky. I have had none.

Sir L. Chiozza Money: They obviously come from a certain source.

Chairman: I should like them to go to a certain source.

Sir L. Chiozza Money: As the subject is raised I state what I have stated. I should not have mentioned it only the *Daily News* article has been referred to. This is a greater offence.

Chairman: The moral seems to be to stick to the paper you are used to.

20,463. *Sir Allan Smith:* (*To the Witness.*) I will quote from this article: "But although they"—that is the coalowners—"argue thus"—that is to say that they are against nationalisation—"they are not opposed to nationalisation as a policy. On the contrary they are for it." Is that a fair criticism

of the evidence you have given?—It is absolutely inaccurate. I should rather like to have said something stronger, because if there is one thing upon which the coalowners of this country are unanimous, it is that nationalisation of the industry is disastrous to the nation and as all patriotic citizens they are doing their best to oppose it.

20,464. On page 20 you have a statement in your *précis* which is quoted in this article to this effect: "I am authorised to say, on behalf of the Mining Association, that if owners are not to be left complete executive control, they will decline to accept the responsibility of carrying on the industry, and though they regard nationalisation as disastrous to the country, they feel they would, in such event, be driven to the only alternative—nationalisation in fair terms." Would you tell me what you mean by "executive control"?—I mean if a mines manager is not allowed to decide for himself subject to, of course, the direction he may receive from his directors or the owner of the colliery as to what he should do underground in regard to working and developing the coal and to take precautions for the safety of the men for whom he is responsible, that under these circumstances the coalowner would not accept the responsibility or possibly the conduct of these mines. They also feel that if these powers were interfered with by legislation the property for which they are trustees would be rapidly destroyed and under those circumstances they could not undertake to carry on a policy which is going to destroy the property for which they are trustees.

20,465. Is that the sense in which the paragraph in your *précis* was framed and on which you have given the evidence you have?—That is so.

20,466. Coming to this next question of the proposals you make for the future organisation of the coal industry, do you accept this scheme as it is framed or are you putting it forward on behalf of the Mining Association?—I am putting it forward on behalf of the Mining Association as a contribution to the effort which we think is due to meet a situation which has arisen.

20,467. Is this your opinion as well as the opinion of the Mining Association?—It is my opinion that this scheme would work well if it was given a fair trial.

20,468. Do you ask the Commission to consider reporting in favour of such a Council as you give here?—That is what I am asked to do on behalf of the Mining Association, and I also commend it for whatever it is worth on my own humble personal recommendation.

20,469. You appreciate the result of your cross-examination this morning indicates there are many difficulties in the way of the application of the Scheme, which have not been considered?—I do. I cannot undertake to say this scheme is necessarily a perfect scheme in connection with all its details. It is the general principle in connection with improved powers for securing the economic production of the coal that I think will commend it in the first instance, and in the second instance I commend it generally on the broad principle that it extends to the men an interest in their work which they previously have not been given when wages have been influenced by the prices which have been obtained for the commodity which they secure from the minerals in the earth.

20,470. Of course, you appreciate that if you ask us as a Commission to report in favour of the scheme that you give it would be unreasonable to allow the Commission to fill in the details, the details should appear in the words of the scheme?—It is quite possible there are a good number of loop-holes left in a scheme which has not been admittedly very thoroughly considered, and it has only been considered, of course, from one side. If the miners' representatives were prepared to consider a question of this kind which is put forward with a view of trying to arrive at some arrangement on a mutual footing it seems to me it is quite possible that modifications might be made in the scheme so as to make it mutually acceptable.

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

20,471. Do not you think the time has arrived when you ought to be very specific in the provisions of your scheme in order that the Commission may realise what you intend to suggest?—I intend to suggest these proposals. I admit they have not been under the careful scrutiny of either the general public or of the men.

20,472. Have they been under the careful scrutiny of the Mining Association?—It has been under the careful consideration of a committee which was appointed by the executive of the Mining Association, which was given full powers to deal with this subject.

20,473. Would that committee with the powers it has to deal with the subject revise this scheme and give a little more of the details of its administration for the information of this Commission?—I am sure they would be only too glad to do anything of that kind that is in their power.

20,474. *Chairman*: By when can you let us have it?—I was going to point that out if I might. Our organisation has, I submit, been good in many districts. Our organisation as a coal industry for the United Kingdom has never been perhaps fully developed. When matters connected with the coal trade such as legislative proposals which are going to affect the whole trade are brought forward, then the Mining Association is called together to consider proposals of that nature and to confer with the Government from time to time, but the organisation has always been in districts in connection with all wage questions up to the present time, and we have settled all wage questions and all local differences in the locality concerned. Now if we are to go back to the Mining Association, the Mining Association would say at once: "We cannot as an executive of the Mining Association deal with the subject unless our respective representatives on the Mining Association go back to their respective districts and consult them. That takes time and then differences of views occur between district and district. Our representatives will have a difficulty in any short period of time in coming to any decision which I think would be helpful to this Commission."

20,475. *Sir Allan Smith*: Of course that is all very well, if I may say so. We are not subjected to the same amount of latitude with regard to the matter of time as your Association has been and we have to report by June 20th. If we have to make up our minds on a scheme such as this and fill in the details, we may do you a very grievous harm because we have not your advice as to how you think your scheme would work. Is it not for consideration whether, having regard to the fact this Commission has been sitting since the beginning of March, a special effort should be made by the colliery proprietors to work out this scheme a little more in detail so that the Commission might be in a position to test its value?—All I see that would be possible in the time would be for the various districts to be called together and to be asked whether they would authorise a Committee to deal with this subject, each one expressing, so far as they felt inclined at the moment, their view. You see where we are to-day, being the 21st May.

20,476. I understood you to say a Committee had received full power to present this scheme, and, accordingly, has presented it on behalf of the Mining Association, and you have expressed it. Surely that Committee having full power to present the scheme has equally full power to work out the details so that one can understand this scheme?—We have had the opportunity of conferring with our respective districts on the scheme which has been so far presented; and, taking the country as a whole, we have been pleased to proceed with it upon these lines. I feel that we have some limitation in our powers in dealing further with it unless we consulted our various districts.

20,477. It comes to this. The Commission has to apply its mind to this scheme and come to a conclusion whether or not it is feasible?—That is so in principle.

20,478. Let us have the scheme: "The wages of the workers in each district, instead of varying with the selling price of coal, should be regulated with

reference to the profits resulting from the industry in that district." What do you mean by "wages"? Do you mean the standard rate or earnings?—Are you referring to the scheme as drafted on page 28?

20,479. Yes. I wish at the moment an interpretation of the word "wages"?—You are asking me in regard to the first paragraph on the top of page 28?

20,480. Yes?—"The wages of the workers in each district, instead of varying with the selling price of coal, should be regulated with reference to the profits resulting from the industry in that district." What is your question?

20,481. My question is the interpretation of the word "wages." Does that mean the standard rate or earnings?—The total aggregate wages should vary—the wages would be the total money the miners will receive under the scheme.

20,482. *Sir L. Chiozza Money*: Earnings?—The total earnings.

20,483. *Sir Allan Smith*: The earnings. How does that compare with the standard rate of wages referred to in sub-section 1 and in paragraph 2?—They are guaranteed under this scheme which proposes that they shall vary; a minimum standard rate of wages which is to be fixed by machinery in conformity with the proposals of the National Industrial Council. That is guaranteed to them, the next step before the miners can secure anything more is for items of cost to be ascertained with a view of securing what will be the amount of profit which is to be distributed subsequent to the payment which will be the return upon capital and for redemption.

20,484. May I suggest that you follow me instead of asking me to follow you, and we shall get through much quicker?—I beg your pardon.

20,485. The position is this. The wages are to be regulated from profits arising from the industry in the district. You say there are the various earnings of the workpeople, and these are to be regulated by profits. You refer to a standard rate of wage, and you say it is to be regulated according to the price?—The standard rate of wage will be fixed by the Industrial Council.

20,486. According to prices?—According to the value which they attach to the labour in each district.

20,487. Is it not the case in the past these wages have varied with the selling price of coal?—Yes.

20,488. In the future they will vary in the same way; the standard rates will vary according to the selling price of coal?—The standard to be fixed by the Industrial Council will have regard to the facts of labour throughout the whole country, irrespective of the price of coal. That is the first proposal.

20,489. May I take that point? The Durham rates of wages are going to be fixed by certain elements, and one is the state of labour throughout the whole country, not Durham?—It will have some relation to it. I apprehend the Industrial Council would, in fixing the standard rate of wages for the colliery district, have regard to the different conditions they would have regard to the different conditions which may prevail in each district. If you take the County of Northumberland or Durham; at any rate, I am speaking for Durham more especially, houses, or rent equivalent, is given to all the married men.

20,490. In Durham?—In Durham; and, in addition to that, they all get their coal free. That custom does not exist in other parts of the country. It is obvious if a standard wage is going to be fixed by the Industrial Council they should have regard to local circumstances in fixing the standard rate of wages which is to be the guaranteed wages of all men who work above or underground.

20,491. That is referring to a minimum or standard rate?—Yes.

20,492. You say: "A minimum or standard rate of wages to be paid to each class of workman in that district, and which, for the protection of the consumer, should be fixed by machinery to be set up in conformity with the proposals of the National Industrial Council." I understood you to interpret that in this way. The National Industrial Council would settle the minimum rates?—At the present time it is settled

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

by Statute. It seems to me there is no reason why the minimum wage throughout the whole country should not be settled by the Industrial Council in the same way, and may settle the standard rate of wages in other industries as well.

20,493. I suppose you are aware the National Industrial Council is not going to do anything of the kind?—I have not heard what the particular proposals are.

20,494. Have you read the Report of the National Industrial Conference?—Yes.

20,495. Have you not seen that the Government is going to present a Bill especially with regard to minimum wages, and a Committee is to be set up to see what the wages are to be?—I do not appreciate the point.

20,496. It is not a question for the National Industrial Council?—The minimum wages?

20,497. Where are the profits made in a company; in the work or in the office?—They are made in such a variety of directions and in a variety of ways, because you cannot carry on a colliery without attaching to it a great number of interests, and it is the aggregate interests, not merely the difference between the cost of selling coal and the price realised, but it is also the margin of profit which may be secured by other interests which attach to the colliery operations.

20,498. That does not enter the question, but let us leave it at that. What other interests do you refer to? Do you refer to where the colliery company owns ships?—Yes.

20,499. Or indulges in other activities?—Yes.

20,500. Do you suggest the percentage to be added to the miners' standard rate should vary according to the profits of the concern as a whole?—I think it ought to vary as far as possible in accordance with the profit obtained in connection with coal. It is one of those difficulties which brings in complications.

20,501. I suppose you can suggest a case where the actual coal getting might be carried on at a loss and the ship owning carried on at a profit, giving a substantial profit to the shareholders of the company?—I have a case in point in my mind.

20,502. In that case, do you suggest there should be no bonus given to the miners, or do you suggest the profits made in the concern wholly unconnected with mining should provide a bonus for the mining?—I think the fair way is the profit connected with an industry so diverse as shipping should be separated from the question of what is a profit secured upon the coal produced.

20,503. You cannot draw a hard and fast line as to whether the profits to be the subject of division are to be purely the profits or losses applicable to the coal mining as an industry in itself in a composite form, or should be the profits of the composite activities of the firm?—I am in favour of an attempt being made in accordance with the profits realisable on the coal produced.

20,504. The profit on the miners' work would be referable to the Coal Department and not to any other department?—That, I think, is the best and least complicated arrangement that could be entered into.

20,505. I suppose you say the same thing with regard to investments in the company which are not referable to the coal produced?—I think that would follow unless those interests were really closely associated possibly with similar colliery enterprise.

20,506. You carry on this equalising idea from one period to another. You maintain the standard rate of wages during the period of no profits, and then subsequently you pay to the shareholders the profits they have lost before any division took place to the miners. Is that your idea?—If an industry in one quarter does not earn sufficient to secure a return on the capital or an insufficient return on the capital, then the subsequent quarter would make that up before a declaration of profit by the accountants which was divisible to the shareholders and the miners.

20,507. If that were to continue for several quarters, would that not result in this, that there would be such a drag or debit against the possibility of such division in favour of the miners that they would

have to be working at their piece-work speed increased by 100 per cent. output without the slightest possibility of getting a division?—On that assumption, yes.

20,508. Do you think any such provision will induce any set of workmen to put forth efforts?—Yes; because under the scheme I feel positive there will be a margin always to be divided.

20,509. You have not given us, and we cannot therefore ascertain, the value of your scheme. Supposing you give us the particular details which would realise what you mean upon that. We cannot fill in these details, because there is no data to fill them in by?—One can always illustrate the operations by figures.

20,510. To illustrate the operation you say here, and perhaps it is the bedrock of the whole question, that the proportion divisible between the shareholders and the miners should be in certain quantities. Of course, if the proportion is anything like equal that would be one set of circumstances. Supposing the proportion payable to the miners was 1 per cent. of what was to go to the shareholders, that would be another proposition altogether. If 99 per cent. goes to the shareholders and 1 per cent. to the miners, that is one proposition; if 50 per cent. goes to each, that is another proposition. Which proposition had you in mind?—If the output of a colliery produced, say, £100,000 during the course of a year for wages and profits, I assume that £60,000 might go to the men in wages, and that would be guaranteed to them. There would then be 15 per cent. distributed to the colliery interest to secure a return on the capital and the redemption of the capital. That would absorb £75,000 out of the £100,000. There would then be left £25,000 to be distributed on a percentage to the men who had earned the £60,000, and be added in the form of a percentage on this basis, and the balance which would be left of that £25,000 would be distributed to the shareholders, the capitalists, to induce them also to take an interest in the productive efficiency of the colliery.

20,511. That is exactly leaving out what I want to get at. You say 25 per cent. will be left, or any other percentage?—It is merely an illustrative figure.

20,512. The figure I want is the sub-division of the 25 per cent. How much of that is to go to the miners and how much do you think should go to the shareholders?—I think the idea would be a division. Whether an arrangement could be come to on the basis—

20,513. What is the division?—12½ per cent. each.

20,514. That is 50 per cent. of the available three revenues which go to the miners and 50 per cent. to the shareholders?—If that 12½ per cent. appeared to be going to give capital an undue proportion having regard to the interests of labour and the interests of capital, then I think that proportion ought to be changed so that the relative distribution should be fair between the interests of labour and the interests of capital.

20,515. Capital in your scheme has already 15 per cent.?—No, it has depreciation included in that, and that might work out to be 7 per cent. or 8 per cent. itself.

20,516. Capital for a variety of reasons has 15 per cent. You suggest further that capital might get 12½ per cent. which is 50 per cent. of the available balance and the other 50 per cent. should go to the miners. Then you say that might not work, and you might have to suggest a scheme where you give 40 per cent. to the shareholders and 60 per cent. to the miners?—The proposal under the scheme is the division of the proportions should be a matter of arrangement in the district.

20,517. The scheme does not say that?—That is certainly our idea.

20,518. Let us have it that way. You are not going to give a certain percentage to the capital firms?—It is an average for a district.

20,519. The division will be a district division?—Yes.

20,520. That district division would apply to all firms equally?—On a certain basis—tonnage probably.

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEARLAM.

[Continued.]

20,521. You cannot say whether you could fix a figure, or a figure once fixed would be maintained?—No.

20,522. You ask us to accept your scheme without any knowledge or data what is really the bedrock of the whole scheme, namely, the division between the shareholders and the miners?—The proportion of the division payable in our scheme is to be a matter of arrangement in the various districts.

20,523. Supposing you have small and unprofitable collieries in the district and several large and profitable collieries, or suppose there was a large combination that was very unprofitable and several small profitable collieries, do you think it reasonable the district average should apply to the small collieries that could not pay?—It is the custom of the district at the present time. We base all matters in connection with the payment of wages upon the average of the whole county area, and I think on the whole it has worked well and would work well in the future.

20,524. You have indicated certain cases where collieries have gone on working coal and made no return to the shareholders. In these cases would these collieries be subject to the average increase of the district from the point of view of profits?—From the point of view of profits so long as they continued to pay men wages they would benefit in the margin of profit of the whole district.

20,525. Even although the company was actually making a loss?—Even although the company was actually making a loss.

20,526. Would you tell me why it is you have at this stage suggested you should turn over the question of fixing wages from prices to profits?—Because we have been in the County of Durham in communication with the men with a view of securing a system by which the men would have a direct interest in increased production.

20,527. Was that prior to this year or since the Commission was appointed?—It was towards the end of last year when we were realising in connection with all the increase of wages they were receiving, that diminished production was being secured. That diminished production, unfortunately, has been going on, and has been going on ever since the Interim Report. For instance, my own firm have, I think, the same number of men who were at work before the issue of that Interim Report and they then were securing about 800 tons more a week than now with the same number of men which we have employed at the present time. Comparing those men with the work which they did in 1914 in similar places we are satisfied that there has been a diminished production of about 20 per cent. It is in the interests of the country that the production per man should be raised and it was with that view we commenced negotiations with the men to try and give them a direct interest in increasing their output per man. There was a scheme devised by Durham and we entered into negotiations with the men and we thought we were going to enter into satisfactory arrangements with the men. The scheme was not so complete in form as the one here. We indicated to the men that they would receive a percentage of the profit which would be ascertained by our mutual accountants from the books of all the owners in the county of Durham. That was as far as we got in connection with the men when the trouble at the commencement of the year occurred in the whole trade.

20,528. You identify this increased work with the profits of the company? You ask from the men an increased output? If they gave an increased output should they not get an increased profit, whether the company was making a profit or not?—There must be a fund from which they get their profit.

20,529. If the district is not making a profit they do not get their balance?—They do not get a percentage at all.

20,530. You desire at the same time they should increase the output whether a profit is made or not?—Certainly.

20,531. The profit being made by the company and not the men?—They get their wages guaranteed; then you only get a certain return on the capital invested.

20,532. My point is you wish them to produce the increased output whether the company is able to make a profit on the increased output or not?—Certainly, because the increased output will help the cost of production at once.

20,533. You must realise with regard to production and consumption if you produce more than you can sell, the probability is the value of the article will go down?—Yes.

20,534. Would you not agree that if you got the men to produce too much they are doing the best thing to reduce the profits?—No, because the output of a colliery is always measured really by the demand.

20,535. Who measures it?—It is the economic law.

20,536. Who measures the output?—Those who receive the demand from the public have to secure the output from the mines with a view to meeting that demand.

20,537. The output depends upon the number of orders you receive?—Yes.

20,538. How do you reconcile that position with the position that you wish the increased output from the mines?—Because you help to secure a profitable industry and help all other industries if you can secure a profitable industry. If you do not secure a profitable industry your men do not do their best when at work.

20,539. You restrict the production of the colliery according to the orders you receive?—That is the way you always have to meet a supply and demand which occurs and which is always varying to a slight extent.

20,540. Do you not think it would be better if you could give to the miners some inducement to increase their output without reference to profits at all and that you increase wages to the miners directly according to the amount they increase their output?—I should always be prepared to entertain any scheme that would secure that.

20,541. Would it not be more simple than going into a complicated arrangement of distribution?—The difficulty is to find the fund out of which to pay the increased wages.

20,542. You have the fund out of which to pay the wages?—Yes.

20,543. You say you are prepared to pay extra if you get an extra output, therefore, presumably, on the extra output you have the fund out of which to pay for the extra output?—You have a certain amount of capital before you go into the concern which has to provide the wages fund with which to start your establishment.

20,544. Do not you think it would be better to give the working miner at the end of each week according to output some sufficient rate of wages to justify him putting his best into the work?—It would be, I admit, a more direct appeal than is suggested under the scheme, but it would be a greater tax upon the capitalist and, after all, you have to induce capital to enter into the concern with a view to securing success.

20,545. If you have a system which would give you satisfactory output, would your difficulties with regard to capitalists disappear?—If you can provide a fund out of which such moneys could be paid it would be an added incentive to each individual.

20,546. Do you think that a scheme that gives to each miner at the end of each week an added sum for output is preferable to one under which he has to wait for a month, six months or a year?—Yes.

20,547. *Chairman:* Have you in mind, Lord Gainford, the number of districts there would be? You are putting forward a scheme to which we have given very great attention, naturally, and in that scheme you say, "The wages of the miners in each district, instead of varying with the selling price of coal, should be regulated with reference to the profits resulting from the industry in that district." Will you tell me how many districts you had in your mind?—I am speaking off book. My impression is 15 to 20. I think Mr. Cooper could say exactly what the districts are which we have suggested. In our scheme we are suggesting they should be those established under the Minimum Wage Act.

20,548. I know that. One of your ideas is rather to repeal part of the Minimum Wage Act?—Yes. That paragraph is intended to refer to the existing Minimum Wage Act.

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

20,549. I thought the Industrial Council was to settle the minimum wage, that is to say, going by the districts?—I have admitted to the last Commissioner the Industrial Council does not propose to establish the minimum wage. I myself saw no reason why they should not, but I was told the Industrial Council suggested that that should be done quite separately from any other work which has been imposed upon them. If that is so, the Industrial Council would not settle the minimum wage but settle the standard wage.

20,550. You mean the same number of districts as there are in the Minimum Wage Act?—That was the intention of those who discussed the scheme with me. Those districts named in the Minimum Wage Act would be calculated to meet the situation.

20,551. *Sir L. Chiozza Money*: May I direct your attention to the second paragraph at the bottom of page 6 under the heading: "Illustration of Profits." I think you argue there as though it were in favour of the private ownership of mines that the profits have in the first place been uncertain, and, in the second place, remarkably low. Is that so?—I wish to correct an impression which has been conveyed to the general public that profits in the coal industry over a term of years have been high and excessive. I also wish to state for the benefit of the Commission and the general public that it is desirable that private enterprise should be left unfettered if capital is to be attracted into the industry, because it is a speculative character of industry.

20,552. The facts are as I stated them, that the profits are uncertain and that on the whole they are low. Is that so?—They are speculative, and having regard to the risk which is run they are not high.

20,553. You also said you thought the 1s. 2d. profit per ton which was provided by the Chairman's Report, and which is accepted by the Government, is, in your opinion, insufficient—inadequate?—I think it is, if you are going to secure any future development.

20,554. Is it more or less, this 1s. 2d. you were getting—I do not mean your firm—but the industry was getting before the war?—The 1s. 2d. judged by an average, I think, of five years, according to such figures as have been available before the war, is rather more.

20,555. It is more?—I believe it is.

20,556. You could answer this question simply by saying it is more?—I believe it is; but having regard to the value of capital to-day it is quite insufficient to meet the situation.

20,557. I know. My question is, is it more or less. It is more?—It is more.

20,558. Would you look at your scheme in relation to workmen's wages in paragraph 3 on page 28. (1) The workmen are to get a minimum or standard rate of wage. (2) The accountants are to come to an agreement as to what wages are; and (3) There is to be a minimum reduction on profits to the mine owner. You think 1s. 2d. is not enough?—If you want to see the industry progress it is not enough.

20,559. That is to say, you anticipate that whoever fixes this, these qualified accountants will be asked by your side to put up a case for more than 1s. 2d.?—They will put up—

20,560. According to your opinion they will do so?—They will fix what apparently—

20,561. I ask for your opinion. I thought you said in your opinion 1s. 2d. was inadequate. Therefore I take it, so far as you had any action, would ask for more than 1s. 2d.?—Certainly.

20,562. If the coalowners were to get more than 1s. 2d. what balance is to be left for the wage earner and where is it to come from?—From a reduction in the cost of production, which to-day is very excessive.

20,563. You anticipate a fall in the cost of production. Is there any other source from which you think the workmen will get anything after you have got more than your 1s. 2d.?—I think that will be the main source for the increase of wages; there will be a reduction in the cost.

20,564. Do you really anticipate that an excess profit over 1s. 2d. will be equivalent to a fall in

the cost of material, or something of that kind?—I am quite sure there is plenty of scope for it.

20,565. You do anticipate a very considerable fall in the cost of material to the mine owner?—In the cost of production.

20,566. Through an increased output?—Through an increased output, which will have a very considerable effect.

20,567. You anticipate that increased output will result from this incentive given to this scheme?—It ought to.

20,568. If you think 1s. 2d. is not enough, and you want a much more considerable incentive for the mine owner, what margin is to be left as an incentive for the workmen under the scheme of division of profits?—Under the illustration which I have just given another Commissioner, if you had £25,000 to divide that would be a considerable inducement for the workman to do his best with a view of securing as high a percentage on his wages as possible.

20,569. I refer you again to page 6?—Each workman under the scheme would practically become a policeman watching his neighbour with a view of trying to help the economic production of the colliery.

20,570. You do not anticipate by what you describe on page 6 as the speculative character of the industry, there will not be losses in the future?—There are certain to be losses in individual collieries, and certain to be periods when the workman will have to forego any very large percentage. I think taking the coal trade over a period of years the workman will get a very substantial percentage on the standard rate of wage fixed by the Industrial Council.

20,571. You express that opinion?—Certainly.

20,572. Will you contemplate the result of a good year following a bad year? Supposing in a bad year or a moderately bad year of trading in a certain district the amount of profit was such that you gave the workman his minimum or standard rate, but the shareholder does not get quite the whole of his minimum allowance. That bad year is followed by a revival in trade in the next year, and substantial profits are made. You suggest that that profit must in the first place go to make up to the shareholder what he did not get in the previous years?—I do. May I answer your question fully?

20,573. I should have thought a short answer would answer that?—No. I do not think you appreciate one fact, and that is in the wages which the men receive a very much larger sum is involved than in the percentage given to the shareholders which is comparatively small now. The wages must always, I think, be about eight times the amount of any dividend that is contributed to the shareholders.

20,574. Does not that accentuate my point? Does it not mean really that in all probability in the succeeding good year the workman would get nothing out of the profits, and the whole would be required to make up the arrears on the previous year?—No, it means a very small balance in this one year would quickly refund any profit due to the shareholders, whilst there would be a very substantial sum left to be divided amongst the workmen.

20,575. Would that occur where you say you made a profit of 1.6 per cent. per annum in your own firm?—That was the amount divided amongst the shareholders, but there were provisions made for development with a view to securing future profits out of which the workmen get the benefit.

20,576. I am afraid your own paragraph has rather misled me. Your profit is only 1.6 per cent. If you mean you did make a higher profit, but you applied it to development that is another matter?—A certain amount of money is always spent in development before you distribute anything to the shareholders. I want to point out the shareholders as such in this period only received that rate of dividend.

20,577. I put it in a good period following a bad period there would be no incentive to the miner to work as he would be working for a dividend for the shareholders?—No, he would not. It would want a very little sum to make up money showing any

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

interest on capital whereas he runs the chance of getting a considerable advance in percentage in his wages.

20,578. You are going to divide the whole of the profit in future—it is to be pooled?—Yes.

20,579. In this district there are good mines and bad mines. You know in that succeeding year of good trade the profit will not only make up the cumulative preference dividend to the capital to the man but it will make up the cumulative preference dividend to the bad workman or badly managed mine?—I still assert the amount would be really insignificant in the whole county in paying the interest due on the capital whilst the amount would have been very substantial with regard to the distribution of profit to the men.

20,580. I suggest in small collieries the offer would not be attractive to the worker, but destroy the initiative of the individual mine manager or worker. He would know he was working not to give a dividend to himself but to distribute profits for badly managed companies?—I am quite sure under this scheme private enterprise would continue and the initiative which a mine manager has under that system to-day would be maintained.

20,581. If there were 100 mines in the district 20 or 30 of which were much below the standard and those working the better mines knew they were working to make up the losses of past years on the badly managed mines, what then?—I do mean to say that the men would continue to put forward their best under a scheme of this kind.

20,582. The mine manager would put forward his best, knowing he was working for the pool in his district without any advantage to himself and his own company?—He has many other things to influence him to put forward his best.

20,583. It is the argument of a private enterprise; the thing that tells is the profit of the enterprise?—I have said in my *précis* that it is not gain that influences men to do their best. A man has in mind the success and achievements he will secure.

20,584. We have been arguing that all along. May I take you to another part of your scheme. You say, speaking for the Mining Association, that you agree with the Report of the Acquisition and Valuation of Land Committee. You also say you agree to the principle laid down in the Report of the Coal Conservation Committee. You do not expand that. Do you agree with what the Government has done in pursuance of the principle of the Report laid down by the Coal Conservation Committee?—To what are you referring?

20,585. The Government has introduced a Bill to carry out those principles. Do you agree?—Except so far as they may be modified by Mr. Leslie Scott's Commission Report.

20,586. It has nothing to do with Mr. Leslie Scott's Report. The Government has introduced into Parliament a Bill for the nationalisation of electric power?—I think that Bill will have to be carefully considered. I am not at all satisfied that the creation of these enormous stations is always going to be to the advantage of industry.

20,587. Are you aware that Parliament passed the Bill with one opponent?—Are you speaking of the third reading?

20,588. The second reading?—I am speaking of the details.

20,589. Do you agree with the principle?—Yes.

20,590. You agree with the principle that electric power should be nationalised in this country?—I agree electric power should be so arranged and developed as to secure the best economic results. I am not personally in favour of nationalisation of even electric power. I think it ought to be placed under considerable Government control.

20,591. Are you against the Bill?—I am not necessarily against the Bill.

20,592. You know it nationalises electricity?—I know it takes that form. I am still of opinion there ought to be the best provision for the distribution of electricity.

20,593. Would you have voted for it or against it if you had been in the House of Commons?—I should

like to have the Bill before me before I give an answer.

20,594. You say the coal-owners accept the principle. It is upon those principles the Government acted in framing their Bill?—I am in favour of Government control of the distribution and management of electricity.

20,595. That is an experimental industry and in its infancy, and coal mining has been going on for a long time?—It is very useful to the industry with which I am associated.

20,596. It is in a very rapidly progressive and experimental condition according to one of the witnesses?—I know a great number of people who have utilised this power.

20,597. You are in favour of national control of electricity, but not in favour of the nationalisation of coal?—I am certainly not in favour of the nationalisation of the mining industry of coal.

20,598. But you are with regard to electricity?—Under certain prescribed conditions.

20,599. With regard to Mr. Leslie Scott's report—have you read it?—Yes.

20,600. Do you agree with the creation of a sanctioning authority?—Yes.

20,601. Do you know the composition of that sanctioning authority?—It suggested that there should be Members of Parliament from both Houses and there should be experts added to it.

20,602. It is a joint committee of both Houses?—With other additions.

20,603. It is a joint committee of both Houses?—Yes.

20,604. Do you think the present state of Parliamentary business and with the present Grand Committees that are sitting in the House it is practicable that a Joint Committee of both Houses should undertake so important a duty as what is suggested with regard to the coal in this country?—I do.

20,605. Do you know of many occasions lately owing to the pressure of Parliamentary business that is increasing it is found you cannot get a quorum for the Grand Committees?—I do.

20,606. Do you think a Committee constituted in this way is a businesslike way to deal with this question of the coal industry of this country?—Yes.

20,607. Why?—I know that when you approach Members of Parliament and place duties upon them, there is no difficulty in securing competent men from the House of Commons to undertake the work.

20,608. Can you tell me any similar Committee which has been appointed to carry out the duties that are specified on page 5 of Mr. Leslie Scott's Report?—I cannot recollect one at the moment. I am still quite convinced that men sent to Parliament are prepared to help an industry of this kind, such as suggested. It is a different duty which is suggested than when the members are casually called upon to go to a Committee Room upstairs where the proceedings are taken very little notice of by the Press.

20,609. You say that although they have to have in hand a mining department, and the department has to go to them constantly under different heads under which they may be consulting the mining department, including the establishment of an insurance fund with regard to the letting down of the surface?—It is because of the serious character and definite work to be given them that they would respond to the call of duty and attend to their duties.

20,610. I have as high an opinion of Members of Parliament as you have, but that is not the point. The point is that you think it a business-like suggestion that an authority so constituted should have the Government control of coal in this country?—Yes.

20,611. You think it is?—I am sure of it.

20,612. Now with regard to the Mining Department. Do you think this Mining Department should, as is recommended in this Report, have centralised under it all the departmental duties in connection with mining?—I do.

20,613. It should be a separate Ministry?—I think the suggestion in the Report is a very practical suggestion. I have no better one to make.

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

20,614. May I take you to the Post Office. You comment on the Post Office. May I ask you whether you consider the Post Office is efficient or not?—It is a very relative term.

20,615. It is well understood?—I think with more money at its disposal it could supply better facilities to the public; but, having regard to the limitations under which it acts, I regard it as a very efficient service. I am speaking of the personnel as a whole. I am very satisfied with the work and with the performances of Civil Servants.

20,616. In short it is an efficient organisation?—It is as efficient as it can be under the limitations which I have named.

20,617. Is it efficient or not? It is possible to answer a plain question with "Yes" or "No"?—Efficiency is a relative term. If you want to have twelve deliveries of letters in London every day, and you call that efficiency, and if the Post Office is only giving you two and you call that inefficiency, my feeling is that two deliveries in London are quite sufficient even although the Post Office might be delivering more frequently. It depends on the services which you are asking to be rendered by the Post Office.

20,618. In your *précis* you say that the telephones are worked at a loss. Is that true?—That is true.

20,619. Do you mean they were worked at a loss when the war broke out?—I am under the impression that they were.

20,620. Are you aware that your information is inaccurate?—No, I am not, but it may be. I know for a certain period they were worked at a profit, but that period finished very quickly after the acquisition of the National Telephone Company, and recently they have been carried on at a loss.

20,621. I am surprised that you, as an ex-Postmaster-General, do not know that down to the outbreak of war the telephone system did not work at a loss?—I accept it from you. I know they worked at a profit, but I cannot say down to what date.

20,622. But you are a late Postmaster-General. Is it not unfair to reflect upon the work of the Post Office and to state that it worked at a loss when it did nothing of the sort?—I say in recent years it has been, and I cannot tell you the exact date upon which the profits diminished and the loss commenced.

20,623. These are the words you used: the National Telephone Company gave a better service than the Post Office, on which the Post Office has lost. Is that true?—Yes.

20,624. Well, I suggest it is not true. May I point out to you the facts. The commercial account made up in a commercial way for the year 1913-14 showed a dividend of 4.29 per cent. These are the official figures of the Department of which you had the honour of being the head?—No doubt I had the figures at the time, but I did not carry them in my mind after leaving office.

20,625. Are you aware that that is after raising the pensions of the persons taken over from the National Telephone Company and providing £158,000 for increased pay, £243,000 for improved pensions, and that if you take these things into consideration—the increase in pay and pensions—the dividend is equal to 7.29 per cent. on the capital involved for the year 1913-14?—The whole of my case for private enterprise is that those costs do not exist under a system of private enterprise, whereas they do under nationalisation, and it is because of the increased cost which is necessary to the system of nationalisation that I am opposed to it on economic grounds.

20,626. Are you opposed to pensions?—Not under a system of public service; I think pensions are perfectly right, and I have done my best to secure them.

20,627. Do you not think it right that a worker should have a pension?—I do.

20,628. Why in your *précis* do you put it as a point against nationalisation that people would have to have pensions?—Because you stop all reproduction or

a profitable basis, upon which alone the nation can live. If you are going to nationalise the industries, you destroy investments of people in the industry and all possibility of raising revenue to enable your country to be carried on.

20,629. And you say that, although the Department over which you had the honour to preside, namely, the Post Office, after paying pensions and raising wages paid 4.29 per cent. on the capital?—It secured a very profitable monopoly from the National Telephone Company, and, of course, for a period it was able to carry on that industry at a profit; but gradually the Government system, which always means increased cost, came into play, and that profit gradually was reduced, until now we find ourselves in the position of working the Post Office at a loss.

20,630. But you know that is only due to war conditions. You would not compare war conditions with peace conditions?—I think if better salaries even were paid to the Post Office than are paid to-day—and I think there are a great number of officials who might be paid higher—there would be greater losses.

20,631. Do you think the postmasters in towns ought to be paid like the mine managers?—I think they have to be paid in accordance with the duties they are expected to perform.

20,632. Do you know we have a return from nearly one-half of the mine managers? These are not selected returns, but merely those that happened to be first examined, and they are, as every statistician knows, a very fair sample of the whole. They relate to 1,700 mine managers, and are you aware of these 1,700 mine managers, leaving out of account some who get a free house and coal, and taking what they are paid—they are employed by over 600 colliery companies—73 per cent. get salaries of not over £400 a year?—I take it from you that those are the facts.

20,633. Do you think that is a scale of payment which is likely to obtain from a man the best sort of effort? I am speaking of the salaries of 1919?—I presume that is the scale of salary which represents in the market of the country the responsibilities and the services which are rendered by these men. Most of them of course begin young, and they receive increments in accordance with their capacity and increased responsibilities which are placed upon them.

20,634. I thought you said that when you were at the Post Office you wanted to put up salaries?—I think some of those in the highest positions get inadequate pay.

20,635. I put it to you that the mine managers are obviously inadequately paid, because although the cost of living is high, we have 1,251 mine managers getting £400 a year or less?—They have had very large increments during the last year.

20,636. This is including increments, and this is 1919. If I gave you 1913 the figures are far worse. Do you not think that that is very unsatisfactory?—As long as they are satisfied, I do not think it is for you to raise the point.

20,637. Do you know that they are very dissatisfied?—If there is dissatisfaction, I am quite sure justice will be done.

20,638. You have been the head of a public service and you have reproached the public service with paying bad salaries. Now I put to you the mine managers' salaries. You say the salaries must be right, and I have no right to mention them to you, because the managers must be satisfied. Do you think that is a reasonable way to put it?—You have to arrange salaries according to certain considerations, and I am neither here to condemn or to commend any particular salary paid to any particular mine manager. I think as a rule they are paid in accordance with their capacities and their responsibilities.

20,639. And you think that it is a sufficient reward for the man who takes the great responsibility of managing the mine. You think it is sufficient?—If you give me individual cases, I may be able to judge, but I say I should want to know the circumstances of each case to show whether a man was in my judgment overpaid or underpaid.

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

20,640. But here are 1,700 colliery managers of which 1,251 do not get more than £400 a year. I put it to you again: Do you think that is satisfactory?—I have no reason to believe it is unsatisfactory. No facts have been given to me to show those men are underpaid.

20,641. But you know they are agitating, do you not?—I have not received any notice of agitation with regard to any managers with whom I am concerned.

20,642. No doubt yours are well paid, but I refer you to more than one half of the whole industry?—I do not know of that.

20,643. It has not been brought to your notice?—No.

20,644. You would agree, would you not, that such salaries are not sufficient reward for such a responsible occupation?—I have not made that assumption.

20,645. If those facts are true, do you condemn them?—I do not condemn them as they are stated by you.

20,646. Do you believe they are satisfactory?—I have no reason to believe they are satisfactory or unsatisfactory. I take them as they stand, and I have no reason either to condemn or to commend them.

20,647. Do you know what £400 is worth at the value of money before the war? Do you know what it is worth now?—It can be calculated out in various ways.

20,648. It is not worth more than £250, if it is worth that?—With regard to buying some commodities, I do not suppose it is.

20,649. Does not that appear to you to be a very unsatisfactory rate of remuneration?—It depends upon the services which an individual is called upon to render.

20,650. Do you not think it is very likely that the State would pay worse salaries than this?—I think to attempt to standardise under classification, which is the system for all Civil Servants, would be really disastrous in the industry.

20,651. That is the answer to another question which I did not ask?—That would be the result of nationalisation. It would be the standardising of these classes with definite wages and definite salaries rising by increments and not according to capacity, which is the principle which exists at the present time.

20,652. Now if you were the Minister of Mines, would you arrange a standard which would pay men worse than this? Can you imagine a Minister of Mines who would arrange a standard worse than this?—I was always in favour of paying well for good services.

20,653. If you were a Minister of Mines, is it not certain that you would not tolerate this?—I think I should be loyal to the people I employ and do the best for them; but at the same time I do not condemn the rate of pay without knowing what are the services which individuals are called upon to render.

20,654. Do you not think it is probable that if the mines were nationalised a greater proportion of these men would get a rise?—I cannot say that.

20,655. Do you not think it is very probable?—I cannot say that.

20,656. Now to come to the coal control: In answer to Sir Adam Nimmo, I think you said, very fairly, that on the whole you thought coal control had been an advantage to the country?—I thought under the circumstances which existed it was necessary there should be some coal control.

20,657. I think you said it would be unfair to compare the conditions of the war with regard to coal in peace time with the conditions of the war as to railways in war time?—Yes.

20,658. Now I come to the question of the coke ovens. In that connection I think you are chairman of the Coke Ovens Proprietors' Association?—Yes. I have been only recently appointed to the position.

20,659. Are you aware that very considerable additions have been made to the by-product coke ovens during the war?—Yes.

20,660. Do you know that that was due to Government stimulation?—Certainly a great number of

plants were erected under the influence of the Government, and a desire to produce, from patriotic reasons, that which was required for the Government.

20,661. Do you know that nearly 3,000 coke ovens were added between 1914-19?—Yes, but a great many were arranged for before the war.

20,662. Do you know 3,000 were arranged for in that time?—After the war broke out?

20,663. Not arranged for, but constructed?—My information is that in my own district a large number of these were in process of being erected, or plants were being prepared, when war broke out. I suggest to you that all those 3,000 are not attributable to the war.

20,664. Obviously not all could be, but I suggest the greater number were?—It may be so.

20,665. And you are aware that special arrangements were made in connection with the Excess Profits Duty to enable construction to go on?—Yes, but on a different scale to that of the collieries.

20,666. And you know the production of crude benzol rose from 19,000,000 gallons to 34,000,000 gallons?—I take it it is so.

20,667. Do you not think that it is a very great tribute to Government enterprise during the war?—I think it is a great tribute to the individuals who patriotically did their utmost to help the Government in their difficulties, but I am not in accordance with you that it should be attributed to the capacity of the Government as a Government.

20,668. What else is it to be attributed to? When war broke out were we not exceedingly short of these by-products owing to the lack of private enterprise in this country?—For the purpose of such a war as we had, we were, but it was through private enterprise that these enormous quantities of materials were secured which were required by the Government, and procured with the help of the Government. For instance, my own firm produced nearly one million gallons of benzol for the Government from our coke ovens which we had erected before the war.

20,669. I am not reflecting upon Pease and Partners?—No. I give that as an illustration. It was private enterprise which secured these results for the Government which helped them through the war.

20,670. Exceptional illustrations are apt to be deceptive. I speak of the country as a whole when I say that these industries were very much behind in respect of German intervention?—For the purpose of supplying materials required in connection with explosives we had made no provision for such a war as we entered into.

20,671. And that also applied to other industries such as dyes, chemicals and so on, which were allied materials?—There were a certain number of materials which we supplied, and some firms secured their requirements from abroad, but the demand was very small then.

20,672. But in regard to all these industries private enterprise has done very little, has it not?—I think private enterprise has been far ahead of any national effort.

20,673. Is it not the fact that these things were pointed out by writer after writer, scientist after scientist and economist after economist, and private enterprise took no notice and did not establish these industries?—On the other hand private enterprise has experimented. Scientists and theorists had theories which they carried out in the laboratories, but it was impracticable to carry them out in practice. You have to make practical experiments to carry a thing to success and that has been done under private enterprise. I know of no nation which makes the same effort in trying to secure success as we do under private enterprise.

20,674. You have sneered at the scientists, but was it not through sneering at the scientists that we were left behind?—I do not sneer at the scientists. I want to encourage them in every possible way.

20,675. I thought you referred in rather a slighting way to the theorists and scientists who worked things out on paper?—You were condemning practical firms in this country because they had not

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

produced things which scientists had suggested and which were things capable of production according to theory.

20,676. But they had worked them out?—They had worked them out on paper and in the laboratories, but it is for practical men to put them into operation, and with regard to all these paper proposals of scientists and theorists, when you put them into practical operation and experiment with them, you find all sorts of difficulties which it takes time to cure. It is under private enterprise that you are able to meet the situation and the difficulties and overcome your difficulties.

20,677. Are you unaware that all these things were worked out on paper, and that great factories in Germany and elsewhere were turning these things out at a great rate while we were not turning them out?—I am aware that the Otto Hilgenstock Company had ovens in Germany, and that they produced a certain number of by-products and more, for instance, than the Simon Carvé had done in France; but we were experimenting with our ovens and materials in this country, and the moment the Germans did show that the Hilgenstock system was a better system than the Simon Carvé we at once went into it, and we have developed it in the way you have described, and so successfully as to meet the situation created by the war.

20,678. Were you not aware our coking coals were imported into Germany which coked them and got the by-products, and we bought the by-products sometimes from them which we might have made ourselves?—Yes. They applied the patent to the production of our coke in the retort ovens. They had superior bricks to us. We had a good deal to learn with regard to the manufacture of these bricks themselves, but we are now able to manufacture the bricks ourselves and able to erect these ovens, and all over the country by-product ovens are being successfully carried on.

20,679. Is it not the fact that the Ministry of Munitions employed a number of men of theory, of whom you have not a very high opinion, and under their guidance we did this?—Of course, Lord Moulton was of the utmost assistance to us.

20,680. Therefore, after this long series of interchanges it may be true that these industries were neglected before the war, and under Government auspices they were magnified out of all knowledge during the war?—It is not true to say they were neglected.

20,681. They were largely neglected?—No. The inducement to secure these retort ovens is the price obtained for the by-products. For a long period before the war the by-products obtained such a poor price in the market that it was not a commercial proposition, and no nation would have thought of entertaining the idea of putting up by-product plant with a view to securing these results. Not only at one time was tar an absolute drug in the market, but the price of sulphate of ammonia fell down to £7, and at such prices it is quite impossible to regard coke ovens of the retort character as a commercial proposition. They are extraordinarily expensive to put up, costing between £2,000 and £3,000 apiece. It is for those reasons and for the quality of coke, which is not equal in the view of most furnace managers to that which is produced by the other kind of oven, that any delay has occurred in their completion and erection.

20,682. Are you aware the Government not only stimulated the erection of coke ovens and stimulated and secured a larger production of these things, but it induced the farmers to depart from their conservatism, which was like the conservatism of the colliery owner, and induced them to use sulphate of ammonia, and so made a market?—I am glad the Board of Agriculture did something in that direction.

20,683. Does that not give you a higher opinion of a Government Department than the opinion you expressed some time ago?—No.

20,684. On page 23 you say my friend Mr. Sidney Webb and myself are in favour of central control. May I ask from what part of the proposals we put

before the Commission you derive that opinion?—I am afraid it is a general assumption from the character of the questions which you ask.

20,685. Is it not entirely contrary to our proposals?—If it is contrary, I accept your view and withdraw that suggestion.

20,686. You have made a great deal, as I think we all do, of the importance of retaining individual responsibility in the mine manager. Do you know that nothing has been suggested here to interfere with clause 2 of the Coal Mines Act as to the direct personal responsibility of the manager for the safety of the mine? Do you know that that is left intact by every proposal which has been made?—I think there have been several proposals, if I mistake not, by which the appointment of the managers would rest very largely with the men, and I think that is subversive of discipline and of executive authority.

20,687. I do not admit that that has been proposed, but if it had, do you think that would be more subversive of discipline than what Sir Malcolm Delevingne told us when he spoke of the not infrequent interference of the directors with the mine manager?—I know of no cases where directors have interfered unduly with their mine manager in the matters which appertain to his department.

20,688. But you are aware that he gave evidence on general knowledge which even you do not possess, as to the mining conditions of the whole country?—I am not a Government inspector.

20,689. If you heard of such things you would condemn them, would you not?—I should think that that is an improper course for directors to take.

20,690. With regard to the proposal you put before the Commission of keeping intact the whole of the economic organisation of the industry and keeping intact, for example, 1,500 boards of directors, do you think that that is a good thing and that they really perform a useful function?—Yes, I do.

20,691. Do you think the expense of maintaining them gives you a sufficient return in the economies of the industry?—I think it is a better system than State control.

20,692. I think you would agree so far at any rate with those who had given evidence like Sir Richard Redmayne, that our mines are very unevenly managed from cases of very good management to cases of very bad management?—I can only repeat my illustration of this morning. If you have a lot of sheep going through a gateway, some must be lost. You cannot have exactly the same position in regard to managing one colliery and another.

20,693. Do you not think if you took one of our large mining districts and if you had one of those districts organised under a capable board of directors, in which you functioned the very best brains of the mining industry of that district, that you would raise the technical level in the district?—No, I think you would lose that personal touch between the directors and the management of the concern which is vital to the economic production of coal in the national interest.

20,694. But why?—Because the moment you get large groups under one directorate you lose that personal influence and that personal touch which in this world, I believe, are essential to successful enterprise.

20,695. I thought you yourself described (I was attracted by what you said) the value of really capable men earning large salaries—I think you instanced a case of £2,000 a year and more—who instead of managing one mine had a number of mines to manage?—Yes.

20,696. Is that a good or bad thing?—I think it is a good plan within limitations.

20,697. Are there not cases where there is a very considerable group of mines under a very capable man?—I do not call one to mind. There may be in South Wales, but I do not think there are in my district.

20,698. If you had a capable man who is paid a really adequate salary, and if that man is responsible to a capable board of directors—the best experience of the district—do you not think you would get better results than now?—No, because even the best of men

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

cannot have a personal insight and oversight over a very large number of collieries. His capacity is limited like everyone else's, and it is essential that he should be able to keep in touch with everything that is going on at all the places under his charge, and he should be in constant touch with the managers of those collieries if the country is to secure the best they can from him.

20,699. I have only one other thing to trouble you with. You have read, I take it, the Report which the Chairman and three members of this Commission (one of whom has had unhappily to retire, Sir Thomas Royden) presented to the Government and also the Majority Report of those members in favour of the principle of nationalisation?—Yes.

20,700. Do you know while the six members recommended nationalisation in principle without going into detail, the Chairman and three other members in paragraph 9 made this recommendation: "Even upon the evidence already given, the present system of ownership and working in the coal industry stands condemned and some other system must be substituted for it—either nationalisation or a method of unification by national purchase and/or by joint control," which means the method of unification by actual purchase or joint control?—Yes.

20,701. You have read that, and you realise that 10 out of 13 members of this Commission as originally constituted have recommended a change of system?—I think these words which I have quoted somewhere occur in that Report of the Chairman's that it is on the evidence given. I think other evidence has been given, and I hope evidence will be produced which may show that, having regard to all the circumstances of the case, with a certain effective voice and certain directions being given to the men, the present system of enterprise still is the best system and in the interests of the country.

20,702. And it was in spite of that paragraph, and in spite of these Reports, that you wrote on behalf of the Mining Association that "if owners are not to be left complete executive control, they will decline to accept the responsibility of carrying on the industry, and though they regard nationalisation as disastrous to the country, they feel they would, in such event, be driven to the only alternative—nationalisation on fair terms." You wrote that in spite of these recommendations?—Yes, for the reasons I have already explained.

20,703. What do you mean by "complete executive control" in this paragraph on page 20 of your *précis*? Do you refer to the technical management of the mine, or do you refer to the joint management of the industry when you say complete executive control?—What I mean by complete executive control is that the directors and their managers should direct the underground operations and also direct the arrangements for the commercial transactions in connection with carrying on the industry.

20,704. There is no doubt about it that your paragraph refers not solely to the managerial responsibility in the technical sense but also to the conduct of the industry in its commercial sense?—Yes, in connection with expenditure and all matters really involving discipline.

20,705. So that the Mining Association, after ample consideration, has come to the conclusion that unless it is left in effective commercial management of the mines, it is driven to the only alternative of nationalisation. Is that the true interpretation of this paragraph?—I think so.

20,706. You do not, therefore, accept the fact that the Government has accepted this Clause 9 and the other parts of what is called the Sankey Report, and you hope in giving evidence to change the mind of this Commission and His Majesty's Government on the subject?—I am sanguine enough to hope that anything I may have said may have made some impression. I do not know whether it has or not. At any rate, really to be perfectly frank with this Commission, I rely much more on the feeling of the country as a whole in connection with a matter of such gigantic importance as this as reflected by their

representatives in the House of Commons than I do upon the action of the Government in a situation such as it was placed in a few weeks ago.

20,707. At any rate, unless you can retain this complete executive control of the industry, which refers not only to technical control but commercial control, you would rather have nationalisation?—I think it would be quite impossible and impracticable to carry out the working of the collieries under any such system as has been suggested by those who advocate nationalisation.

20,708. That is to say, you have made up your mind—the mind of the Association—that the million men who work in this industry are not over, so far as you are concerned, to have any real or effective voice in the commercial control of the industry they work in?—I have told you and I have told the Commission that my view is that if they want more control than they can secure under the various provisions connected with the Joint Committees and Conciliation Boards and organisations which can be and have been set up, the only way I see for them to secure it is by getting direct representation on the managing authorities of these companies.

20,709. As shareholders?—They must come in with their financial interest just in the same way as every other director must possess a financial interest, so as to work for the success of the concern.

20,710. So that unless men become shareholders they are not to have a voice in the management, commercially, of the industry for ever?—That is my view. The industry would collapse at once otherwise.

20,711. You think that in a gigantic industry of this kind the people are to be divorced for ever from the management of it?—No, I do not say they should be divorced. I want to bring the management into as close a touch as possible with the workers, and I believe it exists now.

20,712. Would you doubt whether dissatisfaction exists?—I doubt very much that it exists in the form in which it is suggested by some people.

20,713. That is to say, you believe the miners are satisfied with their position?—No man is ever satisfied with his position. They want to advance their position in every direction and that is quite legitimate.

20,714. But in the long run is it not the fact that you cannot carry on an industry of this kind which requires the hard work and risk of a million men of the country, unless the men have some voice in the control of the industry?—Unless you have their goodwill and you have their confidence and they have yours, you cannot carry on this industry under a system of private enterprise.

20,715. But if you have not got that confidence and goodwill, what would you say? If you could be satisfied that there is really an honest desire on their part to have a real voice in the control of the industry, would you then concede it?—I do not believe the men in their heart of hearts desire to have that executive control which is suggested by your question.

20,716. I should be inclined to agree with you if you really believed that, but I am only putting this: If you were satisfied that there was an honest desire—and Mr. Smillie and other representatives of the miners express that honest desire—do you not think that is a very serious human factor which you have to take into consideration without which you cannot proceed in the name of common sense?—I do not think I have anything to add to what I have already said.

20,717. Even then you would not concede it?—The men themselves know well enough that they could not carry on the collieries if they were to possess any executive control. They are intelligent men and they work perfectly well and reasonably with the mine managers under the rules and regulations which now obtain in the various localities. When I have said that I have practically said all I can, because I am quite sure the men are sufficiently content to deal with the situation as it arises in mutual confidence with the mine managers on all questions that really affect their welfare.

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

20,718. Then it comes to this that they are too sensible to desire nationalisation?—I believe most of them are if they are only informed of the true facts of the position.

20,719. And if they did want nationalisation, I suppose it would be a proof of their lack of sense?—It would not be a proof of lack of sense, but I think it would be proof of lack of their having had full opportunity of ascertaining the true facts of the position.

20,720. *Mr. Arthur Balfour*: I think you agree that it is very important that the consumers should be protected?—Yes. I want the consumer to feel that no injustice is done to him.

20,721. And if at any time there were such large groups of private ownership in this country that that was a menace to the consumer, it would be necessary for the Government to take some steps to meet that?—It is exactly that which I am afraid of in any proposals of unification. You will then secure by amalgamation of large concerns an opportunity of squeezing unfairly the consumers of fuel in the country upon which the industrial welfare of this country depends.

20,722. But at the present time no charge of that kind can be brought against the private owners?—No, the private owners I think have kept within reasonable limits and there is sufficient competition so as to secure for the consumers a fair market as between a willing seller and a willing buyer.

20,723. I suppose the miners' trade union has a very powerful influence?—Yes, the most powerful influence which has been ever seen, I should think.

20,724. And particularly so when combined with the Transport and Railway workers?—Yes. It becomes almost a danger to the State when it is endeavouring to secure its own wish against the interest of the nation as a whole, and under a force of that character.

20,725. Therefore do you think it is necessary that the State should have some controlling influence in that direction to protect the consumers of this country?—That is one of the reasons why we suggest the Industrial Council should correlate the wages of those engaged in industry, so that no undue pressure should be placed upon the Government by any powerful organisation beyond what can be legitimately secured.

20,726. Collieries do fall into natural groups, do they not, in the coalfield?—They do, but there are often very great differences between adjacent collieries owing to underground conditions sometimes. It is attributable to great faults which run through stratifications which entirely alters the character of the coal in adjacent areas.

20,727. I take it you do not think, under private ownership, there is a possibility of further advantageous grouping?—I think further grouping would become dangerous to the State, at any rate having regard to the firms with which I am best acquainted.

20,728. But you would not consider that, owing to the fact that there are certain poor collieries, that is a sufficient argument to nationalise the whole of the collieries of the country?—No. I think if a colliery is not being successfully managed, because it has inadequate capital or the individuals connected with it have not the necessary capacity as compared with some of its neighbours, in a very short time such a colliery like that may be absorbed, and perhaps to the general interest of the community, by one of its neighbours.

20,729. I rather gather from listening to your evidence that you think if the mines were nationalised, you would reduce the efficiency of the whole merely to help a few poorer collieries?—I think one of the ideas is that you should carry on a certain number of collieries which are what I may call below the margin of cultivation and prejudice other collieries which can be conducted economically and to the general advantage.

20,730. You are aware that ballots are taken from time to time as to whether strikes should take place or whether the Sankoy Report should be accepted. Do you not think it is a very serious question with regard to ballots of that kind which are taken that

some third party should take the ballot and not the parties interested?—It has never been the duty, I think, of the coalowners to interfere with the method which the men adopt in arriving at their decisions. They take their own ballots in their own way. I have often thought the questions put to them were put in a somewhat leading way which does not secure exactly the free and independent view of those who cast their votes under the system of ballot as it is generally taken, but at any rate I think whatever the process of taking the ballot may be, that the process ought to be known to the general public, so that they can form a conclusion in regard to the value which ought to be attached to such a ballot.

20,731. Do you not think that we are reaching the time when the State, in the interests of the consumer, should take a ballot of that kind?—I think it would be resented very much by trades unions if they might not take a ballot in their own way, but I can imagine in the interests of the State that the result might be detrimental to the State.

20,732. Do you think it is reasonable that in grave questions of the kind that we have had before us recently boys of 16, 17 or 18 should vote?—It does seem rather absurd that, with no experience, their voice should frequently prevail against those of experienced men who have worked for many years underground, and have had much greater experience; but under the system of democracy which we have at present reached, with equal voting power, or very nearly equal voting power, it is very difficult to refuse men who go underground the same privileges as their neighbours, and I do not suggest myself that there should be any legislation to prevent men and boys recording their votes, although I think it is important that perhaps less weight should be attached to their views to that which may be attached to the views of experienced miners.

Mr. Frank Hodges: Are you referring to ballots in the abstract or any particular ballot?

Mr. Arthur Balfour: Any ballot on any important matter.

Mr. Frank Hodges: Thank you.

20,733. *Mr. Arthur Balfour*: With regard to the interference with wage questions by the Government, do not you think very often a strike takes place owing to the delay which occurs in obtaining the decision in a Government Department, whereas if the matter were left to the owners and men, it would be settled much more quickly?—If you have the machinery ready to your hand so that a grievance is at once attended to, I think that prevents dislocation of trade. Whenever there is delay in arriving at a decision, you have strikes and dislocation of the industry threatened. I do not think under any State system you are likely to have so rapid a system as you have under the arrangements that have been mutually suggested between the owners and the men.

20,734. Is it not the fact that there are a great number of collieries where the men and owners are in close touch and agreement?—That is so, and I think there is no industry where the owners and the men are in more friendly relations than they are in most collieries of the country.

20,735. In that case, would it not be a fatal thing to jump from that to a completely different set of conditions under nationalisation?—I think absolutely fatal.

Mr. Herbert Smith: Would that not be for us to reckon up without asking the witness whether it is wise or not?

Mr. Arthur Balfour: I have asked him the question. Before such a thing is done, and seeing that every human being in the country is interested in the whole question, do you think that a referendum should be taken of the whole country?

Mr. Frank Hodges: I think that this is a matter for the Commission.

Mr. Arthur Balfour: I must have the opinion of the Chairman.

Mr. Frank Hodges: I thought this Commission was the body to come to a decision on that.

Witness: If I may be allowed to answer that question, I should say I believe there are more objections to taking a referendum than there are in its favour. I believe the proper system is, through

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

parliamentary representation, ascertaining the views of the people in connection with questions, as they arise, which need the interference of the State.

20,736. *Mr. Arthur Balfour*: Would you be prepared to accept the finding of a referendum if it were taken?—I should sooner prefer to leave the parliamentary system to operate than to have referendums in connection with matters of this kind.

20,737. Without the question of nationalisation of mines being a matter of considerable moment in a general election?—I do not think on a question of this kind, without the matter having been considered by the constituencies, it is the duty of Parliament to deal with any question of so gigantic a character as the nationalisation of the country's industries.

20,738. You have had great political experience. Is it possible to divorce politics from the collieries of this country if they are once nationalised and managed by the nation?—I think not.

20,739. On page 28 of your proof, when you are dealing with this scheme, you deal with the question of the proportion of the amount of profit between the owners and the workers. What do you propose, with regard to that profit, as regards Income Tax? Is Income Tax to be deducted first?—I am afraid that the State would be certain to desire to deduct from the profits ascertained, just as they do at the present moment before the distribution of wages; but if the State would forego its call of Income Tax upon the men's wages and leave them only to pay Income Tax in the event of their wages reaching an Income Tax limit, I should not object.

20,740. It has been suggested to us that a good deal of coal that is exported from this country might be usefully used here. Do you think that an export duty of 1s. is detrimental to the country?—I object to the imposition of an export duty on coal for two reasons: one is that it prejudices certain areas unduly in the coal industry and assists others, but it also does this—it limits the area of the Continent which we can reach in competition with the foreign competitors, and to that extent it diminishes the trade which we are able to secure, and consequently reflects upon the other industries which depend on transport service overseas.

20,741. To come back to the wage question, do you think that sooner or later the wages that are paid to the miners, or indeed to any class of the community, ought not to come out of the taxpayers of the country, but that it should come out of the industry?—It should come out of the industry.

20,742. At the present time you are aware that it must come out of the taxpayer to some extent?—Yes, I understand there is a deficit anticipated by the Chancellor of the Exchequer which is to come out of the taxpayer at the present time. The Government has received numerous protests with regard to that.

20,743. *Mr. Arthur Balfour*: The fact remains that the Government is paying a large portion of it?—The Treasury inform me that they have received over £7,100,000, and a great deal of that would be lost in nationalisation.

20,744. Do you think that it is a dangerous practice to commence paying wages to any worker in this country out of the taxation of the whole population?—Yes, I object to all these subsidies, because I think they are most demoralising to the industry itself and on financial grounds; I am quite sure that the State cannot stand it.

20,745. With regard to baths and drying arrangements, would you approve that they should be made compulsory?—My experience in connection with baths is very limited; but so far as I have been able to look into the matter there has been no demand by the men for baths at the pit-head. Where baths have been erected in connection with new cottages most of these baths have been abused, and utilised for other purposes than for washing. There have been suggestions made that baths should be put up at central positions—sometimes at the pit-head. In some districts I think it would work well, but where men are exposed to all kinds of inclement weather they would much sooner go home than they would walk long distances in their dry clothes, which they have had put on at

the pit-head, and then walk home in rain and sleet and snow, and reach home in their ordinary clothes, and leave their pit clothes behind them. They would much prefer to reach home in their pit clothes. But that something more ought to be done in securing adequate washing arrangements for the miners, and that they should be induced to wash more freely, I think would be admirable, and ought to be supported by some steps being taken of some kind or another. The Hordeu Colliery, for example, are proposing to erect immediately central laundries and central baths for their workmen. If they will utilise them, I think this sort of experiment ought to be followed by other firms very rapidly.

20,746. Do you not think, in view of the French and Dutch experience in bathing arrangements, we ought to educate, not only the miners, but all the workers of this country into having a bath at their works and going home in dry clothes?—I would not necessarily say at their works. I think you ought to try and educate them in the system of washing at their own homes and having a proper hot and cold water supply in their houses; but, of course, the expense is considerable; and as the cost of building houses is equivalent to about one shilling and sixpence per ton of coal raised to add to that cost by hot water arrangements would add very materially to the imposition on the trade if it were made compulsory. I think these facts ought to be before the Commission, because it is an item of expense which is really connected with the whole of the housing question, which must be dealt with on its own basis and dealt with separately.

20,747. That would not be a recurring expense forever. It might happen once or twice?—I think that the cost of housing is so considerable now that the expense would probably be permanent.

20,748. If it were decided that they must have baths and must have drying arrangements, would you approve of the Income Tax Authorities allowing the expenditure to be put against revenue spread over, say, five years?—I should like to see anything done which would encourage the creation of public opinion in favour of baths, but at the same time I always hesitate to commit myself in connection with special advantages being secured in connection with revenue, because when you get one special advantage for one purpose there are so many others, and the Revenue suffers.

20,749. If it were made compulsory that baths must be taken, do not you think it would be reasonable to limit it to men of 25 and under or even 20 and under?—I think that is very difficult. I am quite sure that the young men are keener about swimming baths than the older men, and would be much more likely to use any baths that are put into houses or placed at the pit head.

20,750. Do you realise that if the mines were nationalised the penalties under the Mines Act would disappear, because one Government Department would not be inclined to sue another Government Department?—I think arrangements ought to be made that the penalties should exist, no matter what the system is.

20,751. Another important question is the question of distribution of coal through City Corporations or District Councils. A witness suggested to us that that was a perfectly feasible scheme and would reduce the cost of distribution. Do you agree in that?—I am not very sanguine that a large Department created of Corporation employers with very good horses and very good lorries, such as Corporations always feel it essential that they should possess, would deliver coal any more cheaply than is done in the present competitive system of merchants.

20,752. Regarding the question that Mr. Webb asked you with reference to the arrangements about new capital, and so on, surely all those questions could easily be provided for by a competent accountant like Sir William Plender?—That is my impression.

20,753. There is no difficulty in arriving at an agreement with the mine workers on those questions?—I think not.

20,754. We have been every day in various agreements in our businesses?—Yes.

21 May, 1919.]

THE RT. HON. BARON GAINFORD OF HEADLAM.

[Continued.]

20,755. Are you aware that the Requests Committee, to which some reference was made by Mr. Tawney, does not decide any question unless it is unanimous?—Mainly these Committees do not decide matters; they consider. But, of course, all questions which under the rules are under appeal to the Conciliation Board are decided ultimately; but there are a certain number of questions upon which only conferences take place, but that is an agreement with the men under the rules which they and the owners have agreed to.

20,756. With regard to the workmen's compensation committees, they also do not decide. If they disagree, the person has to go to the County Court?—They are an executive body only when they are unanimous.

20,757. With regard to the national councils, I take it that you do not mind who fixes the standard wages or the minimum wages so long as somebody fixes them. You are not tied to an industrial council?—I am not tied to the industrial council or any other tribunal, but it did seem to me that when an organisation of that kind was put forward, it should be sufficiently representative of the nation to deal with the problem.

20,758. With regard to the 1s. 2d. profit, is it not fair, when you consider the capital that has gone into the industry since 1914?—There are two considerations which I think are always lost sight of in connection with this matter: One is that the 1s. 2d. is based upon profits. Now, there are a large number of concerns in which there had been nothing but losses. Those losses are never taken into the total account before the ascertainment of the profits. It is the profits only which come into the calculation and not the losses, and then there is also this point, which I think is very seldom sufficiently realised, that there is always lying in connection with the working of the colliery a large amount of capital which is dormant. Take, for instance, my own firm: We calculate that we have generally something like £600,000 which at the moment is not earning money. It is money being spent for future developments, and while those developments are going on, it is yielding no profit, and if you take any particular period you will find there is a large amount of money being spent upon which, up to a given date, there has been no return whatsoever, and the 1s. 2d. does not provide interest; we should regard it as capital with a deferred yielding capacity.

20,759. Regarding the minimum wage scheme under your proposal, does it not appear to you fair that, whereas the mine-worker would be paid his wage whether the trade is good or bad, that under those circumstances the owners should have their, what I call, minimum interest on their capital made up?—That seems to us to be a fair proposition, because the standard wage is guaranteed to the men, and therefore, if you are going to carry on the industry profitably, you must have some kind of return on capital, or otherwise there is no inducement for any development work or progress to take place.

Mr. R. H. Tawney: Would you ask him if the standard wage is guaranteed against production?

20,760. *Mr. Arthur Balfour:* I am asked to ask you if the standard wage is guaranteed against production?—It would be left entirely to the industrial committee to decide whether, having once fixed a standard wage, circumstances justify its alteration subsequently. I can imagine that it would be fixed for a considerable period at a time.

20,761. In the Industrial Council or some other authority?—Yes.

20,762. It is suggested to you that, because the electric light undertakings of this country can be nationalised, it is a reasonable thing that the coal mines shall be nationalised. Surely the production of electricity is a much more simple affair than

mining coal?—Of course it is, because in connection with electricity everybody wants to be treated alike and to secure a supply on similar terms. That is one of the advantages which can be put to the national side of an industry.

20,763. With regard to the post office, it is suggested that it made a profit?—That is the telephones in one year.

20,764. Taking the whole undertaking—post office, telephones and telegraphs—and really finding out what is the capital employed in the post office, which does not seem to be at all clear, is there any profit?—There has hitherto been always a loss—not always, but for a considerable period in the working of the telegraphs. The telephones I have already dealt with. They were carried on for a short period after the absorption of the National Telephone Company at a profit; they are now losing money. The postal services up to the time of the war were always carried on at a profit, and under the system of the penny post. With regard to the penny being increased to 1½d., the advantage in that has been more than met by the increased cost of labour which has now to be paid to the employees of the post office, and the profit has vanished.

20,765. Again, have you any information as to the extent to which houses have been erected by the owners?—I have been given a return.

Chairman: I am afraid we must go into this in the morning, because a number of the gentlemen here have an important interview with the Coal Controller at 5 o'clock, and it is already past the hour.

Witness: If I may say so, the figure that I should like to give is that during the 10 years from the 1st January, 1904, to the 1st January, 1914, there has been spent on building or purchasing new houses in Durham £1,711,000; in restoring and substantially improving old houses, without including outside current repairs, £339,000; or an aggregate of £2,050,000. In Northumberland similarly the figures are £377,000 on building or purchasing new houses. In restoring and substantially improving old houses £139,000; or a total of £517,000; making a total for the two counties of £2,567,000.

Chairman: Now Mr. Smillie wants to ask one question.

20,766. *Mr. Robert Smillie:* I am sure we want to come to a unanimity on the question of nationalisation, and I want to put a proposal to you. Would you be willing that the mineowners and the miners should take a joint ballot of the miners, the shareholders in the mines or the official staff in the mines and the Directors on the question of nationalisation? We will abide by the result. Will the owners?—My reply is that whilst I am not authorised to speak on behalf of the Mining Association in connection with an important proposition of that kind, yet I think that the question is so vital to the nation as a whole that the decision in a matter of this kind ought to be left to Parliament and not to local interests.

20,767. You have said that it is not the miners, but certain interests. I want to put it on behalf of the miners that I believe that they would abide by the result of the ballot. We would take the vote generally between the mineowners and ourselves?—I do not think that a decision arrived at by the mineowners and shareholders in one industry which affects the whole industries of the country ought to be taken, because I think it would exercise an unfair influence upon the interests of the nation as a whole, and I think these questions ought to be left to the nation as a whole, and not to the industries concerned.

Chairman: There are certain questions in regard to the distance which I understand one of the subsequent witnesses will deal with. Therefore I will not trouble you about it. I am much obliged to you for the assistance you have given to the Commission.

SECOND STAGE—SEVENTEENTH DAY.

THURSDAY, 22ND MAY, 1919.

PRESENT :

THE HON. MR. JUSTICE SANKEY (*in the Chair*).

MR. ARTHUR BALFOUR.

MR. ROBERT SMILLIE.

MR. R. W. COOPER.

SIR ALLAN M. SMITH.

SIR ARTHUR DUCKHAM.

MR. HERBERT SMITH.

MR. FRANK HODGES.

MR. R. H. TAWNEY.

SIR LEO CHIOZZA MONEY.

MR. SIDNEY WEBB.

SIR ADAM NIMMO.

MR. EVAN WILLIAMS.

SIR ARTHUR LOWES DICKINSON, }
 SIR RICHARD A. S. REDMAYNE, } *Assessors.*

MR. ARNOLD D. McNAIR (*Secretary*).MR. GILBERT STONE (*Assistant Secretary*).

Chairman: Gentlemen, I have had a letter from the Ministry of Labour written by the Secretary, under date 21st May, 1919, to the following effect: "I am directed by the Minister of Labour to request you to be good enough to inform the Chairman of the Coal Industry Commission that the name of Sir Arthur Lowes Dickinson, Senior Adviser to the Financial Control of Coal Mines, has been added to the list of officials to assist the Commission as assessors." I am sure we are very glad to have Sir Arthur Lowes Dickinson's assistance.

Gentlemen, the next witness that we are going to call is Mr. F. P. Rhodes, who I think comes from

Yorkshire. Now we had the masters' case presented to us very fully by Lord Gainford, and the Commission considered it necessary to administer to him, in the course of the proceedings, 1,098 questions. I think that, as Lord Gainford has been so thoroughly examined by over one thousand questions upon the matter on that issue, when we come to the other witnesses for the masters we might perhaps exercise a little discrimination in the length of our cross-examination. I therefore propose, when Mr. F. P. Rhodes has given his evidence, to ask Mr. Herbert Smith, the Yorkshire Miners' Association Agent, and a member of the Commission to cross-examine him on the one side, and Mr. R. W. Cooper upon the other.

MR. FREDERICK PARKER RHODES, Sworn and Examined.

20,768. *Chairman:* Your proof, which is headed "The Mining Association of Great Britain (Coal Industry Commission)," says in the first paragraph: "I am a member of the Executive Council of the Mining Association of Great Britain, chairman of the Dalton Main Collieries, Ltd., and also at the head of two large manufacturing concerns. I was a member of the Royal Commission which reported on the subject of mining royalties in 1893, and for over thirty years was the secretary of the South Yorkshire Coal Owners, and managed their affairs. I retired from that position some time ago, and have simply been requested to attend here to-day on behalf of South Yorkshire and also on behalf of the Mining Association of Great Britain, because I happen to have known the coal trade in that district for a longer period than the other gentlemen who are now connected with it. I have been more or less connected with the trade for over fifty years, and am generally conversant with the mining industry throughout South Yorkshire and also, to a considerable extent, in the adjoining districts." Those are your qualifications and the circumstances under which you give your evidence?—Yes.

20,769. I will ask you now to be good enough to read the remainder of your proof.

"*The Effect of Nationalisation upon Individual Effort and Enterprise.*"

It is difficult to answer this question without referring to individual effort and enterprise in the past, as without looking to the past it is not easy to enter upon predictions with regard to the future. So far as South Yorkshire is concerned I think that the

statement 'the present system of ownership and working stands condemned' is incorrect. I believe the development that has taken place has been greater and more rapid than would have been the case under any Government Department, or, in fact, under any system in which the whole of the mines had been vested in one hand, whether national or private. I remember the district in the sixties when there was a very limited output from a comparatively small number of pits mostly clustered round the town of Barnsley and working a limited area mostly adjoining the outcrop. That state of things has been altered under private enterprise until in the last pre-war year the district produced over twenty-eight million tons, and within the last fifteen years even, an area of coal greater than the old portion of the district has been developed.

It has been suggested that coalowners have lagged behind, firstly, in the adoption and use of better methods for the purpose of ensuring safety, and secondly, in the adoption of better methods for cheapening production and increasing output. I submit that that stricture, even if it contains an element of truth in some respects, cannot justly be applied to South Yorkshire in respect of measures for securing safety, which have generally been in front of and not behind the Home Office authorities, but it must always be remembered that it is experience that brings knowledge, and that knowledge and progress must therefore be gradual to be safe.

In a large proportion of the pits gunpowder was abolished and safety explosives used in its place before there was any compulsion to take to that course.

22 May, 1919.]

MR. FREDERICK PARKER RHODES.

[Continued.]

The exhaustive experiments carried on by my brother, Mr. Charles Rhodes, at Aldwarke Main, which commenced in 1882, demonstrated the dangers of the old type of safety lamp; the reasons for them, and the methods to be adopted to obviate them, and as a result the right and improved type of lamp was adopted long before there was any compulsion to do so, and an important step taken for securing safety.

Furnaces were abolished as a means of ventilation and the fan substituted in advance of statutory requirements, and so far as I know, everything has been done to keep the industry abreast of the times.

In the newly-developed portion of the district, the owners have been faced with the difficulty which presented itself owing either to some slight change in the character of the seam worked or from the heat experienced as working depths increased, or possibly from both. Gob fires made their appearance and caused trouble as the depth increased and presented a problem that was urgent. I do not believe that any central body could have dealt with this trouble more rapidly or better than private ownership dealt with it. The best brains in the district collaborated and worked together. The services of Professor Haldane were called in, there was no restriction on the spending of money, and every effort was made to secure safety.

A laboratory with staff was set up and worked under Professor Haldane's direction for the purpose of investigation and research, and for exhaustive experiments to endeavour to discover the best type of rescue apparatus.

So far as water is concerned, South Yorkshire affords an apt illustration of the benefits of private enterprise and initiative. For a long time past the South Yorkshire owners have known that the water question in the future would become serious unless grappled with, and the best brains at their command have been brought to bear on the solution of what is undoubtedly a difficult problem, and I believe they have moved faster and to better effect than any Government department could have done. After mature consideration the question was brought to a head by a report from Mr. C. E. Rhodes, together with one from myself. Those reports dealt, firstly, with the engineering questions involved, and, secondly, with the best method of attaining the objects in view. Authority was at once given to act on them. The result was that sixteen or seventeen large collieries combined themselves for the purpose, purchased the whole of Earl Fitzwilliam's system of water levels and pumping plant, which at the present moment safeguard the whole of the district lying to the deep of a line drawn roughly from south to north from a point near the town of Rotherham for a distance several miles away to the north. I prepared the scheme for raising the necessary funds and apportioning cost and for operating the scheme for the benefit, not only of existing collieries, but also of those to the deep in the future, and prepared a plan for obtaining from Parliament the necessary powers for extending operations to the extreme northern and southern edges of the coalfield, and protecting the whole district once and for all. It is only right to say that Earl Fitzwilliam dealt most fairly and liberally in the matter.

It was proposed to promote a Bill in the next session of Parliament for this purpose, and I am sure that private initiative would carry that scheme through far more successfully in the hands of men who know the district, and know what they want, than would be the case if it was directed and controlled by some central authority, or, as a matter of fact, by any Government official. The present proceedings have stopped that.

I should have liked to have seen it carried through and to have made it my last work for the benefit of the district.

Private initiative and enterprise has also gone a step further in the direction of co-ordinating sales and purchases of stores by collective action on the part of some of the larger pits instead of by individual purchase as at present, and under my direction the necessary scheme was prepared and is being acted

upon. It must not, however, be taken to be assumed that the creation of an authority for controlling sales, if it proceeded far enough to amount to a monopoly, would in the long run be beneficial either to owners or to the community.

It has been suggested again that if the mines were all in one hand something would be done in the way of great central power stations to generate power and so avoid waste of fuel consumption. There is undoubtedly truth in the suggestions that have for some time past been made as to the desirability of establishing great central stations for power generation, providing local conditions are suitable and the methods adopted are prudently conceived and wisely carried out. It is clear that to obtain the full advantage of any such system the generating station should be in a convenient situation in so far as the pits are concerned which supply the fuel. That assumes that you decide to generate electricity by the consumption of fuel at one point of generation, but a great deal can be done by utilising available sources of power without that course being adopted, and for some time past a number of the principal companies have been engaged in formulating a scheme by which all heat produced at coke ovens or blast furnaces, and not already required, should be utilised on the spot in addition to utilising any steam power which may be lost at present, by capturing it and using it by means of mixed pressure turbines. By this method no power produced at any of the collieries can be wasted or allowed to escape.

Each of the collieries and works are to be connected by cable, so that they may be able to give and take power and supply the surplus to others. The necessary cables were ordered some time ago and are now in course of erection, and if it had not been for the war the system would have been in full operation to-day. At the Staveley Coal and Iron Company's works they are at the present moment able to supply the neighbouring town of Chesterfield with electricity. Clay Cross is lighted by gas from the Clay Cross Company's ovens. The Grassmoor Company supply gas to Chesterfield.

While, therefore, gentlemen have been indicating to the Commission what collective ownership would bring about, private ownership and initiative have in fact been anticipating, as far as possible under the circumstances, the suggestions thrown out where they were practicable at the moment from the point of view of the ordinary business man, and a further and greater scheme for central generation has been under careful consideration.

Several municipal bodies are also at the present time supplied with waste gas from South Yorkshire collieries direct for lighting, thus reducing their fuel consumption at their gas works.

I certainly do not like, as one who has taken some part in the development of the district, to sit down under the suggestion that has been thrown out in the course of this enquiry, that I and my associates are either ignorant or incompetent, or have neglected any duty that should have been performed or allowed profits to come before safety.

I believe that nationalisation, which I assume means State purchase by or on behalf of the State, will not cheapen production, if by that expression is meant the production of the total amount of the coal supply of the nation in return for a lessened total expenditure. It may, of course, lessen the cost of fuel to some individuals if you supply some at less than cost and others at more than cost, or it may lessen the apparent cost by supplying everybody at less than cost and falling back on what is called 'the State,' which here means simply the other industries not nationalised, and the general body of consumers, to make up the deficiency, though I fail to see where, under that system, any benefit would be derived by the community at large. Nationalisation means simply the creation of a monopoly vested in the State, and a monopoly operated by the State is a disadvantage to the community, for all monopolies have a tendency to eliminate or discourage individual effort. All monopolies possess the power, of covering up mistakes and loss by increasing prices, and the possession of power always constitutes a temptation

22 May, 1919.]

MR. FREDERICK PARKER RHODES.

[Continued.]

for its exercise in an emergency. Objections of that kind, however, would apply with far greater force to a private monopoly, and from the point of view of the community at large it is immaterial whether such a monopoly would be controlled by owners or workmen or both.

I am bound to say that from the point of view of one interested in the consumption of coal, apart from its production, I view the prospect of the loss of reasonable competition and private enterprise, and the submergence of the industry in one hand, with very considerable apprehension, for unless the trade of the country can be carried on, and the goods that the country produces are produced at a price to enable them to be sold abroad, then the nation as a whole must eventually starve. If production is reduced, exports must be reduced, and if that occurs what is to take its place—something must be exported to pay our way, and how can other industries do it if strangled for want of the fuel on which they depend, or if unable to obtain it at a figure which will enable them to sell their goods?

Consequence of the Removal or Decrease of the Reward Earned by Private Capital.

One very important point in connection with this should be borne in mind. The Commission has laid down suggested limitations which would regulate or restrict the remuneration that private capital invested in coal mining might receive. I do not propose to discuss or argue about the figures that have been put before the Commission. The members of it have no doubt had enough of those, but I would like to draw attention to one thing, and that is the assumption that the capital of collieries is represented by a sum of 10s. per ton of annual output. I have always had doubts as to the accuracy of that figure, but it is extremely difficult to arrive at a true total figure and therefore, so far as existing pits are concerned I will make no further comment beyond the expression of that doubt. But, assuming that capital funds for the development of the industry are to be provided by private enterprise in future, then it should be pointed out at once that any remuneration based on the assumption that the capital of a colliery undertaking is 10s. a ton is absolutely erroneous and without foundation.

It may be that the alteration in value of the monetary unit accounts for many changes, and probably that alteration in value is largely, or, at any rate, partly accountable for the increase in values generally—but if you take a pit sunk and equipped in the years immediately preceding the war, and contemplate putting a similar pit now on the next adjoining coalfield, then the capital that was sufficient before the war will be utterly inadequate, and the capital you will have to raise and expend now must be more than double the pre-war figure.

If, for instance, you consider the cost of coke ovens and bye-product plant, it is impossible to put down one to-day equipped with the necessary accessories, without more than doubling the cost. It is suggested, and one hopes, that the cost of material will fall, but in so far as this depends on the wages of labour, or the price of the articles into the production of which the consumption of fuel largely enters, I do not see how any articles in which that is the case can be expected to be lower. If, however, it is assumed that the cost of a fully equipped colliery in the future will be £1 a ton—and I am sure it must be more—it is obvious that any remuneration which might theoretically be considered sufficient to justify the retention of existing capital is totally insufficient as an inducement to attract additional capital. Remember that for four years development has been stopped—remember the years that it takes to sink and equip a great modern pit—already a serious situation has arisen, and we are in that way alone ensuring a coal famine in the immediate future, and the present threat to the industry is accentuating that position.

It is known now that the average profit derived from the coal mines in the past, spread over a period of years, has not been extravagant, and certainly not more than profit derived from other trades, less

speculative in character, but the additional capital has come in as required, first because in periods of prosperity people are led to embark in what they then believe to be a profitable industry, and second, because everyone imagines or hopes, and generally believes, that the particular adventure he is embarking upon will be one of the plums of the industry and not one of the poorer type.

If, therefore, private capital is intended to be utilised in future, the remuneration to which it is suggested present capital should be restricted is absolutely inadequate to attract it, and remember it must in some shape keep coming in to the old concern as well as to establish new ones.

Larger Units of Working.

Speaking generally I can see no advantage in larger units of working, except in those cases where collieries send their produce into one common market or work coal that might be more advantageously worked by one concern rather than by two, and where it is in their common interest to amalgamate.

It is a mistake to suppose that because small pits exist in some districts, it would be an economic gain to replace them by bigger ones. Where they do exist, and the subject is enquired into, it will generally be found that they represent the best method of working the particular area in which they are situated.

I cannot see where or how Nationalisation can actually affect the working conditions of the small collieries one way or another or how it could lessen cost in production or increase output of coal.

Waste of Coal.

In dealing with this subject I cannot see any gain that could be derived either from Nationalisation or from any form of Unification, and I am desired to say at the outset, on behalf of the district I particularly represent, that we desire to dissociate ourselves from the statement made by Sir Richard Redmayne that private ownership in the past has been either wasteful or extravagant. It is perfectly true that coal has been left in the pit, and it is equally true that some coal will always be left in the pit. Mr. C. E. Rhodes gave the reason in his evidence. Small coal at one time was undoubtedly left in the pit; if, however, it had been brought out of the pit it could not have been sold, but there was a demand for the other classes of coal and by taking that course the pits were kept working and the men employed.

In our main seam, namely the Barnsley bed, in most pits some portion of the upper part of the seam must be left in to ensure the safety of the roof in the working faces, and the extent to which this occurs does not depend upon considerations of profit or loss. The whole of this coal, however, is not lost, as part of it is recovered."

I have read that as part of the proof, but really my brother dealt with it in his evidence.

"I have never been able to see that the allegation that coal has been wasted in barriers is altogether correct, if it is assumed that all those barriers represent coal needlessly left.

It is true that barriers have been left in many cases and it is difficult to see how they can be dispensed with entirely. In some cases they must exist for the mere purpose of ventilation, in other cases they may be dispensed with by adopting other methods of providing air-tight boundaries, but I do not believe that it would make any material difference, as far as barriers are concerned, whether the mines belonged to private individuals or whether they belonged to some central authority operating them for the nation. I know of none left as mere boundaries.

Effect of State Employment as against Private Ownership.

I do not believe that this would make the slightest difference. I have never observed in my limited experience that the mere fact that a person was an employee in a Government office increased his activity or induced an abnormal desire to work, and I believe the true incentive to work in the past has been found,

22 May, 1919.]

MR. FREDERICK PARKER RHODES.

[Continued.]

and in the future will be found, in the need of the individual to earn money for subsistence, or to earn more money for the desire of gain or for the provision of the various things that tend to ameliorate life and benefit either a man or his family.

Dual Control.

I agree generally with the view that has been expressed by Lord Gainford in the *précis* of his evidence, which is in the hands of the Commission, on this part of the subject. There is no doubt that advantage could be derived both by the workmen and the mineowners from co-operation in the industry on which both depend.

Every thinking man for a long time past must have had in his mind what methods could be adopted so to carry on the various industries as to benefit all those actually engaged in them; and I have always thought that in the long run the only sane and true method of equitable participation in the benefits derivable from any industry between all concerned in it would be found in some system of co-operation or, if you like, co-partnership. But in such system, like any system which in the long run is to succeed, one must ensure, or at any rate assume, that the article produced by the industry is to be sold at a higher price than its cost, and that those concerned in the industry reap the benefit of the difference; and any such system can only be established and operated with success with the consent and goodwill of all engaged in it. I, as an individual, have never seen much objection to some of the suggestions that have been put forward by the miners. I have never personally thought that in the long run it would be any disadvantage that some of them should be fully acquainted with the working of the concern, and it has always been my view that if they decided really to co-operate and improve, and not to obstruct, benefit could be derived, though I believe that they exaggerate that benefit to some extent. For instance, it may be they could not tell those of us engaged in the industry anything we do not know at the present time, but at any rate it would be an advantage that they should be sure that all parties did know all the facts that were available and present to their minds as well as to ours.

I have always believed that they would rapidly appreciate the difficulties inherent in carrying on a complicated commercial undertaking such as coal mining, and I am sure that any suggestions they could make with regard to safety, with regard to the state of things underground or the like, could never do any harm, and very likely would be of value. As an instance of this I have always supported the examination of pits by representatives of the men, appointed under the Act, by the men themselves, and never could see any objection to the proposal, but it must be borne in mind that eventually, whether in a colliery or any other concern, and particularly in a colliery, there must be one authority and one person who, as manager, should in the last resort be supreme. You could not carry on a colliery successfully if the authority of the responsible manager on the spot was lessened or interfered with any more than you could expect a colonel effectively to command a regiment unless he had the necessary power to see that his orders were carried out. I think Lord Gainford in his *précis* has indicated the outlines of a scheme which would be workable and could be carried out. But either that or any other scheme depends on willing co-operation for its success—without it then it is useless."

20,770. I have been requested to ask you, when you got to that point in your proof, about the districts which are referred to in his Lordship's scheme. I do not know whether you are the gentleman who is going to tell us that, or whether it is one of the later witnesses who will do so?—If I might be allowed to make a suggestion, I am perfectly ready to answer any question to the best of my ability, but I have not taken part in the preparation of the scheme. I have neither had the time nor the opportunity for doing it.

20,771. Could you tell us who has taken part in it?—Yes—Mr. Hugh Bramwell, who follows me, and also, I think, Mr. Thornycroft.

20,772. One of the gentlemen associated with you passed me a note with regard to asking one of the witnesses questions about the district?—I would suggest that you ask Mr. Hugh Bramwell as to that. I ought to say also that the scheme has not originated recently, but it has been under consideration since October, 1916, and the Committee have been working at it all the time, and have had to deal with all the various points which have occurred, and he will know the reason why they have not been adopted.

20,773. We are obliged to you. Will you please continue the reading of your proof?

"Conclusions to be Drawn from Experience of Other Countries.

I do not think, from such knowledge as I possess, any definite conclusions can be arrived at from the experience gained in other countries or in the Dominions as far as nationalisation of mines is concerned; for the reason that no country that I know of has applied nationalisation either to the whole or even to the majority if its mines.

Germany apparently has gone as far as any nation, but the facts there do not help much. In Germany you have had in the past two great monopolies or trusts working side by side—one monopoly under which a considerable number of the mines were vested in the State, and the other monopoly in which the remainder of the mines were controlled by a huge combination or cartel. I believe that that cartel operated in the direction of an artificial price for home consumption above the figure that ordinary demand would have justified, and I also believe that the effect of the State monopoly was possibly to some extent to check or counteract the effect of the private monopoly. But it is impossible from the state of things that existed in Germany to draw any accurate conclusion and apply it to any position in the future where either this or any other country may elect to operate the whole of the mines for the benefit of the nation. There does not appear therefore to be any reliable precedent or guide, and nationalisation here must therefore be an experiment or leap in the dark, taken in reliance on theories alone, and will be a dangerous venture. Its sponsors appear certain it will succeed. I believe it will not. But I am sure of this—that if it fails it will be the greatest calamity to the community, and will entail disaster that unfortunately will fall first on the industries outside it, and lastly on its authors."

With regard to the increase in output by use of machinery, if I may, I will read this because it is in the proof, but really my brother dealt with it in his evidence.

20,774. If you please?—

"Increase in Output by Use of Machinery.

I think the suggested increase in output by the use of machinery is doubtful, and should not be relied on in any estimate of probable output.

There are always difficulties in getting coal cutters in as the question of price arises; but assuming that difficulty is cleared away, their use to advantage is limited by local conditions. Where they are of real use is in seams where the character of seam and floor are suitable for their use, and particularly in thin seams. In some cases they give excellent results, and are used—they have one drawback, as they often limit the direction in which the faces must travel.

In some cases conveyors are of benefit, but under South Yorkshire conditions in our principal seam, I cannot see how their use can be much extended with any advantage in output.

In South Yorkshire, and particularly in the newer pits in the Barnsley seam, I agree that a good deal can be done, and is being done, to replace ponies by machinery—although I doubt if it will increase output—but it by no means follows that while you can lay out new pits to adopt particular methods you can do the same in all old pits which have been developed under entirely different conditions.

22 May, 1919.]

MR. FREDERICK PARKER RHODES.

[Continued.]

Neglect of By-Products.

It has been suggested that this part of the industry has been neglected in the past. It has not—its extension depends on the demand for coke and it cannot be developed to advantage unless coke can be made and sold at a profit, and in the past the demand for coke has been fluctuating and uncertain. Before the war the supply was rather in front of the demand.

All trades want coal; but it is not so with coke, which is more limited in its use, and by-products really are by-products—they can only follow coke which is itself produced at a profit, or, at any rate, not at a loss.

Germany developed her bye-product industry on the cartel system. There the cartel fixed and maintained the price of coke to the home consumer at a profitable figure and then developed the by-products on that basis. In other words, the German users of coke paid for it.

You could not have done that in England, for several reasons, not the least being the fact that the German law facilitates combinations and enables them to be maintained, while English law does not.

And it must be remembered that only some of the seams that are worked produce coal that will coke.

Distribution and Transport.

I can see no great saving here and do not agree with the evidence given as to saving already effected during the war by reorganisation of areas of supply. Railway economy, there, so far as it may have been achieved, has been obtained at the expense of the consumer. I have always been convinced that so-called pooling of wagons will never fulfil the expectations of its advocates.

You cannot eliminate the middleman entirely—he will be there under State or private ownership either in his present capacity or another, but there is no reason why local distribution should not be undertaken by municipal or co-operative bodies, and that is the direction in which improvement can and should take place.

Compensation in Event of Nationalisation.

Some suggestions I have seen put forward as to compensation for collieries or minerals if acquired by the State are unsound and unfair.

They have often been based on so many years' purchase of income. That might do as a somewhat doubtful basis for a guess as to possible value of the whole, but is absolutely wrong as to the value of the different units.

If adopted it would result in a dying pit or diminishing mineral area being dealt with at a substantial figure, while the developing colliery or mineral area of far greater prospective value would be treated as of little value though worth far more if sold to someone else to-day. There is only one fair value, and that is the price that a willing purchaser would pay to a willing seller, both taking all circumstances into account.

The past annual return is clearly an element in value, but it is only one, and the probable future return is in many cases of equal value and in many cases of far greater value.

Effect of Royalties on the Industry.

I cannot see where any saving to the industry can arise here. If the State became the owner of the minerals it must (in justice to the taxpayers) charge a fair rent for them. If it acquired them at a fair price from the present owners the incidence on the industry should be the same. If it acquired them at less than value or confiscated them, that is a different matter; but up to now no English Government has contemplated that action, and if ever it did, the consequence to national credit would be so far-reaching it would not pay.

The acquisition of minerals from present owners is, however, by no means the simple and easy subject that many seem to think. I and others devoted a great deal of time to the subject in 1892 and 1893 on

the Royal Commission which then enquired into the matter, and neither time nor pains were spared to get to the bottom of it; but the more it is examined the more complicated it becomes, and we were all eventually (although there was divergence of opinion at the commencement) driven to the conclusion that it was useless to consider it as a practical proposition if dealt with by itself alone.

Severance of surface and mineral ownerships have caused all sorts of variations in rights of ownership, of support and the like. In many cases some seams are owned by one owner, others by another, and the surface by a third. Large sums have been advanced on security of minerals, exchanges effected of lands reserving minerals, of land for minerals, and in other ways—sales have been made at one price with right of support at another price without it, or with a qualified right—settlements have been made, and in many ways you cannot touch the present ownership without the certainty that you must injure a number of people who would not be confined to the owners, and the uncertainty as to where the mischief may extend.

In many cases the right of support for surface is of little value except as a means of obstruction. In other cases the loss of it may mean the absolute destruction of the surface. As an instance, I do not see how the development of a great part of the new South Yorkshire coalfield can proceed much further without restoring valuable agricultural land to marsh and fen from which it was reclaimed. Some 60,000 acres in the level of Hatfield Chase of coal containing lands nearly all owned by different freeholders depend on a drainage system based on a fall of about 10 inches to a mile and will be lowered at the intake end. Many of those freeholders own both surface and minerals, but many do not. There the right of support is a very real and serious matter, and the title of these freeholders to their coal is neither better or worse than that of the largest royalty owners. It is a small owner's question just as much as a large owner's question, and in some of our collieries many small freeholders are lessors and have held on to their land through bad times with the object of eventually letting their coal. I have, however, always been in favour of doing away with the unqualified right to obtain an injunction to prevent letting down and for powers to obtain the right of wayleave where required on fair terms, and to make it impossible for anyone to hold up minerals to the detriment of the nation.

But all these can be attained without depriving the owner of the possession of his minerals. In South Yorkshire and the adjoining districts there has been little cause for complaint against lessors. The rents are moderate and have not increased, but the reverse. The terms of modern leases are as fair as can be, and I would either let or take coal on them without hesitation, and am glad that I have been able to take a leading part in their evolution. In any large body of men there must always arise some individual cause for complaint, but in South Yorkshire that does not affect the truth of what has been said. The Duke of Norfolk, Earl Fitzwilliam, Col. Foljambe, and others, and their predecessors have been fair and equitable in their dealings, and in Earl Fitzwilliam's case, his conduct in letting coal to other collieries for developing the district, instead of keeping it for his own collieries and working it himself for his own private benefit is commendable."

I would add to prevent any misconception, and sailing under false colours, that I and my family do own royalties.

20,775. *Mr. Herbert Smith:* Will you tell me how many collieries besides those you mention here you are interested in?—I am Chairman of Dalton and a director of Monk Bretton.

20,776. Have you anything to do with Carlton and Frickley?—No.

20,777. Not at all?—No.

20,778. Have you anything to do with the Doncaster Coal Fields Yorkshire Main?—No. My only connection with the Doncaster collieries is as a lessor. The coal under my estate where I live is let to the Markham Main Colliery Company.

22 May, 1919.]

MR. FREDERICK PARKER RHODES.

[Continued.]

20,779. Do we take it from your evidence that you agree with all your brother said as to the method of working?—Yes, I do; except in one respect. I think, if you look, you will find that there is either a printer's error or an error in one question and answer in his evidence. I should like his attention to be drawn to it. If you remember you put a number of questions to him as to working out to the boundary. The Chairman interpolated a question and asked him—I forget the exact words—was there any pecuniary reason why long-wall should not be worked. My brother answered, you have to wait so much longer before your workings get back to the pit bottom. It is obvious what he was referring to was not long-wall working, but working back from the boundary. All workings are long-wall in South Yorkshire; some are long-wall out and some long-wall home.

Sir L. Chiozza Money: We quite understand that.

20,780. *Mr. Herbert Smith:* Your brother went further than that. He admitted they did not have long-wall retreating, because they had so long to wait for some profits?—He said that was one disadvantage. In considering that you have to bear in mind, and I am not at all sure that the gain at the end does not outweigh the disadvantage at the beginning. It is perfectly true you have longer to wait for your return, but when you do come back home your return increases. To my mind, the real objection to working out to the boundary is it fixes your boundary for all time. You never know in a colliery where your exact boundary is, because it may be that whereas your take extends over a particular area, and the adjoining colliery take extends over an adjoining area, some natural division may come which neither of you know of, a fault or something of that kind which makes a piece there impossible to work from that colliery that would work from there. (*Illustrating.*) If you go to the boundary and come home you can never rectify a thing of that kind.

20,781. That is an exception and not the rule?—I do not know that.

20,782. You and I have had experience, Mr. Rhodes?—Yes.

20,783. Can you tell me a colliery in Yorkshire where what you speak of has happened?—In my experience in most of the collieries the original boundaries have been changed.

20,784. Tell us one?—To begin with, the boundary between Monk Bretton and the Carlton was varied by agreement to enable it to be worked with advantage to the two pits. That was long after they started.

20,785. As far as Monk Bretton and Carlton were concerned, owing to Carlton stopping, Monk Bretton was not opened out and Carlton got it?—I am not speaking of the old Carlton Company, but the new one.

20,786. I suggest that the pit you have some slight interest in has already run out to its boundary?—I hope we are not trespassing; which is that?

20,787. Hickleton. Why did it go out?—I am not interested in Hickleton.

20,788. You are the Secretary of the Association?—Yes; but I should not like to say I know the private concerns of every individual member of the Association, although they do trust me with a lot of information.

20,789. What did you do; you went to the boundary to prevent the other people stepping in?—No.

20,790. Yes; it is admitted. Your brother admitted it was owing to expense that you did not go to boundary and bring this coal back?—I could not say that myself entirely.

20,791. You do not agree with your brother?—In some cases you must go out to the boundary. I think that is the case where you work the thick coal seam. In Staffordshire, the Baggridge Pit of Lord Dudley's, it was necessary to drive right to the boundary and bring the coal back.

20,792. Turning to page 2 of your evidence you say: "I submit that that stricture, even if it contains an element of truth in some respects, cannot justly be applied to South Yorkshire in respect of measures for securing safety." I want to submit to you it can?—Very well,

20,793. First is it not a fact that the Doncaster coal field is a danger zone?—I should say the Doncaster coalfield is one which from its local conditions and character requires continual and incessant watch to ensure safety, and I think it gets it as far as it is humanly possible.

20,794. Is that an answer to my question?—I think so.

20,795. Would you not look upon it as a danger zone?—I say unless there is careful watchfulness you are continually running risks.

20,796. Let us see if there is continual watching. I suggest to you that watching does not remove danger that ought to be removed by one or two methods. You know there have been any amount of gob fires, and they are still going on?—I know there are gob fires. I know they have been reduced, and they are a source of continual anxiety to those concerned.

20,797. Although there are gob fires there, if a man takes a match down in his pocket he would be fined for taking that match down?—Quite right.

20,798. I suggest if a man should be fined for taking a match down it ought to be compulsory upon owners to adopt a method to prevent gob fires that are more dangerous than matches?—If you can point out a method by which gob fires can be obviated you will be a benefactor to the community and your suggestions would receive consideration immediately. I do not know how one can prevent the forces of nature from initiating spontaneous combustion.

20,799. There has been one thing suggested, and your brother and other eminent men said it was too expensive; that is to say, retreating. There has been another method suggested. We want to claim to see the hydraulic stowing. Your people said that was expensive, as it would cost 10d. a ton?—With regard to retreating from the boundary, so far as gob fires are concerned, you have advantages and you have disadvantages. I would not pretend for one moment to be an authority capable of giving an authoritative opinion as to the best of those two, but I know what the advantages and disadvantages are. The advantage of going out to the boundary, so far as gob fires are concerned, is this. Your waste is behind you and you leave the fire behind you, if one breaks out. The disadvantage is you cannot get at it in the same way. The system adopted in the Doncaster coalfield at present is this. They have a continual analysis of the air going on, and the moment that that analysis shows that there is any slight development of heat taking place anywhere above the normal, then they immediately take steps to get at it before it develops into a fire. That is the method they adopt.

20,800. *Chairman:* Mr. Herbert Smith's question is this: He suggests to you there are two methods by which this difficulty could be overcome, and that the reason why neither of those methods have been adopted is that both of them were too expensive. Is that true or not?—It is not true. I would say this with regard to hydraulic stowing. I am not sufficient of an expert to be able to give an opinion one way or another. It has never come under my own personal notice, and I would rather not deal with it from hearsay. It has come in since my pit days were over.

20,801. *Mr. Herbert Smith:* Is there any necessity to get to a fire behind you; is it not necessary to stow it away?—You must be able to get at it to do that.

20,802. You must not; that is what I submit. I submit that with stowing if the air is kept from it there is no continuation of the fire?—If you make sure air will not get to it, if you can do that, you have solved a great problem.

20,803. I submit what we do is to stow it up and keep air from it?—That is right; we try to do it as far as we can.

20,804. Air is percolating through packs?—Air will try to get back to the point from where it started, if it can. That is the secret of ventilation.

20,805. That is the point. Air will take the shortest circuit for home again?—Yes.

20,806. And the men would not be working in 110 degrees of heat like they are in some cases?—That is not hardly correct. The object that is in view at the present moment is to cut up the pits into what you

22 May, 1919.]

MR. FREDERICK PARKER RHODES.

[Continued.]

and I would call panels, and it is done in two ways, if you have coal on the side of the panel, in that case that side of the coal is not merely packed but stowed tight to keep the air from the coal. The air goes up the centro gate, splits, comes along the face, comes down the side, the object being to throw the waste dead behind as far as possible in that panel. The other method adopted which Mr. Chambers at Denaby adopts and prefers is to carry out the same system but creates his panels by means of tight packs. I am not prepared to say which system is the best. One able engineer prefers one, another equally able engineer prefers the other. They are both the same thing and both after the same point.

20,807. When you say not hardly correct, do you mean they ought to work in an atmosphere like that?—I did not go on to say what I ought to have done. The effect of drawing the air up the centro gate and along the faces is to cool the face. When you draw all the air on to that and cool the face you increase the heat in the gates; therefore, the atmosphere in the gates I daresay in some cases was approaching to what you say. I believe they have got them down to something like 80, or less.

20,808. It is still proving owing to the cost there is only one remedy, and that is to retreat?—I am not sure. It is a very moot point. After all, I am only an amateur, although I have lived with them so long. I know something about it. I would rather take a more competent opinion to decide it.

20,809. I do not look upon you as an amateur?—Possibly not an amateur altogether; still I would not set up my opinion against an engineer.

20,810. Now, going forward with regard to research, &c., and rescue operations. Do you think Yorkshire is equipped for that?—I think so.

20,811. Do you say when there was that disaster Cadeby was well equipped?—There was a great doubt as to the right thing to do.

20,812. That is not many years since?—No.

20,813. That was in 1912-13?—Are you speaking of the accident when Mr. Pickering lost his life?

20,814. Yes?—It is further back than that.

20,815. It was in 1912-13. I know it because I had to come away from Amsterdam to get down the pit. The King and Queen visited the place at the time?—I suffer from the defects of old age. I remember things a long time back better than things close to. I thought it was further back.

20,816. With regard to safety, you tell us certain things happened and experiments were made and your brother was improving the old type of safety lamp. Ever since I remember we have been gradually trying to improve it, but we are a long way behind yet?—I do not think myself we shall ever be satisfied with the safety lamp. We shall keep on trying to improve it. The lamp I would like to see myself if it could be brought about is an ideal electric lamp; but you cannot rely on the electric lamp alone. You must have the other in combination with it.

20,817. What I would like to see is more ventilation and more naked lights down the pit?—In that case if that pit has to be inspected I should let you do it and stop at the top.

20,818. You know what Professor Haldane and Sir John Cadman said that they would go down Bentley with a naked light?—I remember that statement. I had my own opinion about it at the time.

20,819. It was a statement made on oath?—I thought I should not be the man to carry the light.

20,820. With regard to electric lights, we are always bound to have a safety lamp?—You must; you cannot help it.

20,821. Has there been a desire and intention in Yorkshire to introduce electric light?—I think my brother has experimented with hundreds of different types of electric lamps. I know perfectly well that if we were only satisfied about it there would not be very much objection to the introduction of electric lamps, and for this reason. You may think that the mere question of expense in introducing the lamp is a factor against doing it. I do not think it is. If, for the sake of argument, you could light the coal face in the same way as you light this room with electricity the amount of work you would get done

would be so much more. It would be better done. The better the light the easier the men can work and the better work they will give, but they are all limited by the consideration of safety.

20,822. That sounds well in here. Let us get to practice about what happens in the pit. I suggest to you that you fix your price for a man to get coal by a contract, and it does not trouble you much with regard to the light you give him. It is a question of cost because the electric lamps have not been put in more systematic?—If you give him better light you get a better return from your bank and you immediately reduce your cost.

20,823. Then why have they not put them in? There have been plenty of requests as far as we are concerned?—There is a great divergence of opinion about it. I should not like to express an opinion as to which is right.

20,824. You say you would not like to express an opinion as to which is right, then why do you want to express an opinion and say it is not a matter of cost? Why differ with that? I know it is a question of cost?—I do not think it is a question of cost. I do know that in the early types of electric lamps, how laid down I cannot say, the great doubt was as to whether in the event of a breakage the extinguishing of the spark would act immediately so as to prevent any possibility of igniting gas.

20,825. Now with regard to these pumping stations. Tell us what collieries that includes. It has been on the carpet, as we say in Yorkshire, and pits are waterlogged now?—I have had that in my mind for a great number of years. The late Inspector of Mines, Mr. Wardell, and I took it up and we endeavoured to see if it were possible then to create a scheme for dealing with the water at the level at which it then existed—I am speaking now of the water on the Barnsley side of the district—we found that we could not at that time get all interests together. There were very divergent opinions as to what was the right course to take and what was not. Eventually the work was allowed to stop; Mr. Mitchell put down pumps at the Mitchell Main Colliery to prevent it getting further to the deep of Mitchell Main. Now as time has passed on and you have this great Doncaster coalfield and all the new developments of coal lying to the east of the Midland Railway Company, again the subject was taken up and a number of us met and discussed it. As the result, my brother and I were asked to report upon it, and we did. I will give you the names of the collieries that combined, as far as I can, trusting to memory. They were John Brown and Company; Dalton Main; Manvers Main; Denaby and Cadeby; Wath Main; Cortonwood; Mitchell Main; Houghton Main; Hickleton; Brodsworth; Bentley; Bullcroft, and the Yorkshire Main. I think that is all. I am trying to remember them in my head as they stand on the map. There were 16 or 17 altogether.

20,826. They practically do not touch the area that is affected at the present time?—No; we were all agreed upon this, that what we did was sufficient for the present. If we left it there we should be simply doing work ourselves for the benefit of the others, who in their turn would not pay any proportion of the cost.

20,827. So that private enterprise stopped its progress?—It is impossible to deal with the Barnsley side of the district in the way we deal with that. On that side of the district we had already a system of water levels extending right across. By acquiring that we were placed in possession of the necessary means for intercepting the water. On the Barnsley side there is no system of that sort, and it was necessary to create machinery for the purpose. To do that we wanted Parliamentary powers, not to do the work, but when we had done the work that anybody who was benefited by the work, the other mines, or in the future, should pay a fair contribution towards the cost. If not, the colliery not yet born would come in for nothing.

20,828. Would I be right in saying that the collieries you have named are practically the plums in the district?—I should not say all of them.

22 May, 1919.]

MR. FREDERICK PARKER RHODES.

[Continued.]

20,829. Would you not practically? I will take one out; but I will not take more than one out?—I am afraid I should take more than one.

20,830. Well, I will not take more than one out?—You may take this, at any rate, that the best part of the district is represented.

20,831. You would not ask me to take Manvers out?—No; that is an ideal pit.

20,832. The £1 shares are worth more than 42s.?—I darsay.

20,833. You would not take Denaby & Cadeby out?—Denaby Park Gate is a nice seam. That is better than Cadeby.

20,834. Take the Wath Main?—That is a good concern. It was my brother that re-organised the Wath Main, and made it from a poor concern into a good one.

20,835. Even since I remember it was a good one?—No.

20,836. I used to live next door to a man who had £1,000 in it. He never drew less than 10 per cent., and sold his £1,000 for £5,000?—I should like to have bought that £1,000.

20,837. Would you say that Cortonwood was a bad one. The shares are selling at 54s.; that is to say, the £1 shares?—I remember Cortonwood Colliery being sunk in the early seventies, and for a period of over 25 years it did very little at all. In its later years it has been an excellent undertaking.

20,838. The last dividend it declared was about 25 per cent.?—I think it was. It has a very small capital and, instead of dividing its profits, it has put them into development.

20,839. Should I be right in saying that in any of these collieries, including Dalton Main and John Brown, you could not buy a £1 share for less than 40s.?—I would not give 40s. for one in Dalton Main.

20,840. There are none to sell, I see?—Those of us who sunk Dalton Main met with difficulties, and we went on until our capital was doubled and our hacks began to get too weak to carry the strain. Then we amalgamated with John Brown & Company to get financial assistance.

20,841. On page 3 you refer to private initiative and private enterprise. Your words are: "Private initiative and enterprise has also gone a step further in the direction of co-ordinating sales and purchases of stores by collective action on the part of some of the larger pits"—what large pits are they? Are they one firm?—Again I have to rely upon memory: Yorkshire Main, Hickleton, Bullcroft, Brodworth. I am not sure as to whether there is another or not, so I will not mention it.

20,842. Now go to page 5. Are not colliery companies now amalgamating, as you know very well, not only with regard to collieries, but other works in addition?—The tendency undoubtedly of the present age is in the direction of amalgamation of supplies of raw material. You have an instance of that in The United Steel Company, where you have the steel works and collieries at Rotherham, the iron stone mines at Frodingham and the iron stone mines in the Hematite district, all amalgamated in one concern.

20,843. As far as collieries are concerned this is going on. Take Yorkshire Main, Bullcroft, Brodsworth, and Hickleton. In Derbyshire are they not all practically managed and owned by the same people?—You may say this that you will have people with other interests in all the concerns, but I should not say they were owned by the same people. For instance, Hickleton was sunk really as an offshoot from Manvers. Brodsworth was developed and that is partly owned by the Old Hickleton shareholders and partly by the Staveley shareholders that came into it.

20,844. Bullcroft the same?—Bullcroft is an entirely different concern. There are a number of shareholders in Bullcroft not limited to it. You will find a number of directors in Bullcroft directors of Brodsworth?—Yes.

20,845. In all these firms there are a number of the same directors?—There are different interests all through.

20,846. Amalgamation is going on. Is not that done with the idea of creating a monopoly as far as private enterprise is concerned?—No.

20,847. Let us see if it is not so. If workmen meet those employers they say, "Well, we belong to so and so and we cannot do it unless so and so does it"?—That may be so.

20,848. It is done as a defence for themselves?—That may be so.

20,849. That in itself is combination?—No, not quite. It is utilising another struggle for your own assistance.

20,850. Is it not combination?—No, I should not call that combination.

20,851. Does not one price list practically cover the whole of the Doncaster area?—I should hardly be prepared to say that. I should say the price lists did to some extent at different pits. Naturally they would approximate because they are working the same coal in the same district.

20,852. And varying in thickness?—Yes. You do not as a rule find any two price lists that are exactly alike.

20,853. With regard to waste of coal. Do you tell us seriously that this coal is bound to be left in Barnsley bed, top coal?—I think so. I have often discussed the subject with my brother. If you could get that coal out, and get it out with safety, obviously you would increase the yield of the seam. You have to pay for the total thickness of the seam; it is so much per foot, whether you get it or you do not; therefore it is your pocket interest to get every foot you can. Speaking of the Barnsley Bed, I should not care myself, with my limited experience, to work in a hank in the Barnsley bed coal where the false roof or bid was on the top of the coal unless there was some of the coal left up as a roof as the face was moved forward.

20,854. You and your brother do not agree with this?—I think we should both be in agreement.

20,855. Your brother said that they would expect men to fill tubs behind timber. I said that would be breaking the Mines Act?—We know they do get what they can out of the waste behind, because it is natural they should, and they get paid for filling it. Provided they can do it with safety, there is no reason why they should not do it. He said he should not expect men to be wandering about in the goaf behind picking up coal.

20,856. Could it not be got in retreating or in hydraulic stowing, over a particular area of it?—I do not think so.

20,857. I am sure it could. I have had some experience of it?—I would not pit my experience against yours, nor would I act on my own. I should rely upon the advice of an engineer. I do not think it is safe to get that top coal in the faces of the Barnsley bed unless you happen to have a roof where the rock comes on to the coal. In Shireoaks you get at it close to the roof, but where there is a soft bind you want something underneath it to carry the props.

20,858. Come nearer than Shireoaks. Take Dinnington. Will you come to that?—It is the same.

20,859. With regard to these little pits, I am interested in this. You and I have met on many occasions. We are meeting from a different point of view to what we met last time. Now we are talking about little pits you tell us these little pits are a good piece of business, and when we were putting our case before Sir Edward Clarke you made a special plea that little pits could not afford to pay. Do you remember that?—I did not mean the little pits. I mean the pits about the Barnsley district which are working thinner and inferior seams.

20,860. You put it you had a number of little pits around Barnsley and around Sheffield?—As a matter of fact, I do not know of any about Sheffield except the Ganister pits.

20,861. Yes, you do?—I do not remember any.

20,862. You have three stages of minimum wages?—That is true.

20,863. Is not the Nunnory the second division?—That is not a little pit.

22 May, 1919.]

MR. FREDERICK PARKER RHODES.

[Continued.]

20,864. Is not Tinsloy?—That is a good big pit.

20,865. Tako Waverloy or Woodthorpe?—That is shut up.

20,866. That is working?—I should not call Waverloy a big one.

20,867. What you said then is not correct with this?—I think so.

20,868. Then I do not think so?—What was urged was it was absurd, really, to take the whole coalfield as being one for the purpose of minimum wage. You ought to discriminate between the collieries with reference to their ability to bear the minimum wage. It was pointed out these pits about Barnsley could not carry it, and I daresay some there could not carry it.

20,869. Do you agree pits are seriously taken into consideration when the wages are being discussed for workmen. Does that form a decision?—Every pit must be taken into consideration.

20,870. Do you agree the worst pit is generally taken to form the wages basis?—As to price lists or remuneration.

20,871. As to price lists and profit too, if you like?—As to price lists, the answer is the circumstances of the little pit are both to be and must be taken into account.

20,872. You make a reference to putting in mechanical appliances in place of haulage by transport in the pit. Do you know Yorkshire seems to have the worst record in the figures you have put in for distance our men have to travel, that is, the men have to walk to and fro in the mines?—Are you speaking of riding men?

20,873. Yes?—Not the question of the machinery?

20,874. Do you know that is correct according to your figures?—I will take it, if you say so.

20,875. Mr. Gibson put them in on behalf of the coalowners?—I have not them before me. As you know them, I will take it as correct.

20,876. With regard to transport, putting in machinery instead of ponies. Would it not be wise to go further and say mechanical appliances ought to be used to reduce human labour. They are tramping in tubs anywhere up to 1,000 yards in Yorkshire?—I do not know of one. If there is one, I should say it ought to be altered. You may take it at once from me as an admission, that, although price lists provide for the payment of tramping rises above a certain distance, tramping rises represent waste.

20,877. You would admit that the method that has been adopted, which has been an out of date method, has been more profitable to the employers to get it done by the workmen than by putting mechanical appliances in or ponies?—I would not say that entirely, although, undoubtedly, in all these things, of course, cost naturally comes into consideration. To-day the method of producing compressed air is far in advance of anything that we had 20 years ago. It is suggested that you could utilise electric power for the purpose. I am one of those who in South Yorkshire, at any rate, should hesitate very considerably before employing electric power for that purpose.

20,878. There is no need to put in electric power, is there, when you can get compressed air?—I say the methods of producing compressed air have been immensely improved in recent years.

20,879. With regard to the introduction of machinery such as coal-cutters, has it been your experience that men have fought machinery?—My experience is wherever you introduce any alteration it is only natural that the two parties to the argument, like all Englishmen and even more than all Englishmen, I think, all Yorkshiremen drive as hard a bargain as they can for their own side, and undoubtedly when you make a change there is a certain amount of difficulty. I put that on one side and assume you would get over the difficulty. Even then I do not think their use can be extended beyond a certain limit.

20,880. I suggest they can be extended about twice as much as they are at present in South Yorkshire?—They may be, I would not say. When you are working, say, the Barnsley Bed at a considerable depth and when you want to work it boardways on,

I do not think you could work it with a machine board on. If you wanted to work it at all you would have to work it on end, and I do not think then you would get any advantage because you cannot do very much holing.

20,881. You do put machines in so that it can be got on end?—Where you got the greatest advantage from a machine is where coal wants holing, and when you can replace the labour of the men in holing by the machine.

20,882. You have somewhat tried to defend the position and say both sides tried to drive the hardest bargain?—Yes.

20,883. Do you think it is not a hard bargain when men have been paid 2s. a ton to get out by hand, and you put machines in and offer them 1s. 5d.?—You and I at the moment are in the position of two bargainers. You put forward what you think the right figure from your side, and I should consider it from ours, and probably something between the two is correct.

20,884. Do you know they have been offering at one colliery to get it done and fill it on conveyors at a 10d. a ton basis?—Instead of what?

20,885. Instead of 1s. 10d.?—I cannot say. I do not know if it is so. I should have to know the circumstances to know if it is a fair offer or not; it may be.

20,886. As a matter of fact, it is being done. It is being done under a cloak. I am talking about coalowners?—I may have been accused of many faults, but I have not done anything under a cloak.

20,887. With regard to inspection, you say you have always been in favour of this. On that you are talking personally?—I personally have always been in favour.

20,888. And you cannot talk for the coalowners?—I have no right when I talk for a whole body to express an opinion on their behalf without first asking them what their views are. As an individual I have always considered that was an excellent thing, and where I could I have encouraged it.

20,889. I suggest you are giving evidence on behalf of the Mining Association?—I am.

20,890. Not individually?—I am.

20,891. That is an individual explanation?—Yes.

20,892. I cannot get from you what I want. You are interested in Rotherham?—Yes. I am Chairman of the Dalton Main, that is all.

20,893. I talk about the John Brown Rotherham Main?—No; I have no interest in Rotherham Main.

20,894. You were the Secretary of the Coal Owners' Association during this war?—I was at the beginning, and I undertook to carry out the whole conduct of the Coal Control in South Yorkshire and also to attend to the Association's business; but when the Petrol Committee refused me petrol to get to the station and I had to close my house and go away elsewhere, I felt I was not called upon to fight the folly of a Government Department any longer, and I gave it up.

20,895. Any letter I got from your office was signed by Parker Rhodes?—No, & Co.

20,896. It is signed Parker Rhodes?—Yes.

20,897. If I wrote I wrote to Parker Rhodes. Your firm were acting as Secretary to the Coal Owners at that time?—My firm. I asked the coal owners to let them take it over and release me.

20,898. Let us see how you look at Pit Committees. It was suggested we should meet and try and improve output, and any offending party should be dealt with, whether workman or manager?—Yes.

20,899. Do you know at Rotherham Main Colliery the manager fined 25 workmen one night, and when it came for him to be fined he resigned his position and said he was not going to take any part in the Committee?—I do not know that I took any part in that.

20,900. Mr. Rayner was the manager at Rotherham?—He was the manager at Rotherham Main.

20,901. He fined 25 men, and he was fined £1. He said he was having nothing to do with the Committee now. Is that what you call dictating to the manager?—I think I remember what you are talking about. The question, if I remember aright, arose with reference to a man's train being late as an excuse for being late in getting to the colliery. If I

22 May, 1919.]

MR. FREDERICK PARKER RHODES.

[Continued.]

am right, that particular dispute arose in the case of men who came late who came by tram. The suggestion was that tram and train were the same things. I think it was contended on behalf of the owners they were not, and I can see a very good reason why they should not be. A train is only one; a man must catch his train or lose it; but the tram runs every ten minutes, and if he chooses to delay half an hour for a tram, that is a different state of things. There were reasons for that, good or bad.

20,902. The manager, when equally fined on the same terms, refused to have anything to do with it?—Yes.

20,903. He refused to be interfered with by the workpeople. Do you call that interfering in management?—I think it was between him and the committee—not the workmen.

20,904. The question was between him and the Workmen's Committee?—Yes. Again, you are speaking with better knowledge than I. I know of it second-hand. I was not present at those meetings and I took no part in them. If I had been, I possibly might have done something, as I often have done.

20,905. With regard to by-products, you say you have not been behind in them at all. Suppose I read you an extract that appeared in the "Yorkshire Post" as far back as 1917: "German interest removed from a Crigglestone Company. Our Wakefield correspondent writes:—All enemy interest in the Crigglestone Collieries Company (Limited), near Wakefield, has been eliminated, and the concern is now all British. A few years ago the colliery came to a standstill owing to the company reaching the end of its financial resources. When the pit closed down the effect on the district was little short of disastrous. After a time, however, German scientists who were interested in a patent coke oven came along, and, working the pit in conjunction with the coke oven, turned what had been a failure into a great success. All went well until the war broke out, when certain important servants of the company were provided with fresh quarters. Enemy interest has now been removed altogether." That is from the "Yorkshire Post" in the spring of 1917?—What is the name?

20,906. The Crigglestone Collieries Company?—I should say that was a very fair example of newspaper inaccuracy.

20,907. As a matter of fact, it was not an inaccuracy?—It was.

20,908. Crigglestone was in financial difficulties and closed down until a German firm came and put down ovens and made it a financial success?—There was a company formed to exploit that. They called in a German firm to build the oven. They held out a very glowing prospectus as to what the result would be, which did not materialise.

20,909. Will this be another newspaper inaccuracy? This statement was made by a member of Parliament?—You must not ask me in advance to accept what a member of Parliament says.

20,910-11. This is the 27th March, 1917. As a matter of fact Germans did come to Yorkshire and put down any amount of coke ovens?—That is true, and at the same time it is incorrect. What happened was this. There were two great companies who were engaged in the furnishing and construction of by-product plant. The Otto Company was one, and the Simon Carves Company was another. Those two companies do not work on the same principle, and at that time there was not considered to be any objection at all to utilising either the services or the knowledge of a foreigner. What happened was this. At Dalton Main we put up a by-product plant. We did not put it up ourselves. We called in the Simon Carves Company. They put it up and found the whole of the capital. We paid for it over a series of years. They undertook the management and disposal of the products until we got into it, and when the necessary time arrived, and we had learned all we could from them, we determined the agreement and took over the management ourselves. That happened in other cases. When it happened with the Otto Company it is right to say Germans were

in it, although that company was held out as an English company. We know now it was financed to a very large extent by German money.

20,912. Therefore the Simon Carves was not a German oven?—No. If I suggested that before do not let me attach such a libel as that.

20,913. There was any amount of German money.

20,914. *Sir Arthur Duckham*: This was the Otto oven?—There was no doubt about it in the Otto Company.

20,915. *Mr. Herbert Smith*: Do you know the Yorkshire Iron and Coal Company at Ardsley and Tingley?—No, I have no knowledge of that concern, or its workings.

20,916. Its chairman referring to the report of their bye-product plant said that from a commercial point of view that property was their most valuable asset, and it was a good thing a company like this came along to show them what they knew to make it a success. One of the directors following that up, Mr. Ritchie said although they had an adverse balance of £24,552 it would disappear by the next balance sheet owing to the success of these ovens. Am I right in saying ovens were put up at Hems-worth by this firm?—I say they were put up by arrangement with those firms.

20,917. There was a denial the other day there were more than eight in Yorkshire?—I do not know that anybody denied it. Everybody utilised that method. They could put it up better than we could and at the beginning, what Lord Gainford said yesterday was perfectly true: they had really a monopoly of the right brick.

20,918. As a matter of fact am I not right in saying they did not bring a single brick into Yorkshire to do any of the work?—I cannot say that.

20,919. Bricks were got in Yorkshire?—At a later period of development we found out how to make them ourselves.

20,920. Not even in the first coke oven they put up?—I cannot say that.

20,921. Mr. Smillie said there were seven or eight firms. I want to prove there were more than seven or eight?—I admit it; there were odd ones. I can give you the names of the collieries who put them down if I thought for a moment. Naturally no colliery invested its money in the construction of coke ovens if they could get financed by other firms, and pay on easier terms.

20,921A. *Sir L. Chiozza Money*: It was done by German enterprise?—Not altogether.

20,922. Not altogether; it was German enterprise?—Some were done by the Otto.

20,923. *Mr. Herbert Smith*: If you are going to argue there was no German money, as a matter of fact there was German money in it, I think?—It may be so. I should not dispute it.

20,924. So you are in favour of adopting as much safety as you can on behalf of the workmen. Are you prepared to agree that no workman ought to work in anything higher than 70 degrees F.?—I do not think in those deep mines in the future very likely you will under any circumstances get it down to that.

20,925. I suggest you will if you only have methods to do it?—I do not know how you could.

20,926. Ought you to expect men to work in that atmosphere? Dr. Haldane and Sir John Cadman told us when they got to 80 degrees they lost 20 per cent. in exhaustion?—That is very likely correct.

20,927. Is there any right to work continually in that?—I cannot say. That is a matter in which they ought to have a voice. It is for them to say.

20,928. You would not call that interfering with management?—I should not call that interfering with management. If the men said the heat in this place was so great they could not work in it and they must earn their living elsewhere—it is a free country.

20,929. Have the owners had this scheme under consideration since 1916?—Yes. Let me say at once I have had nothing to do with it. I have not had the time, and I could not find the time to deal with it.

22 May, 1919.]

MR. FREDERICK PARKER RHODES.

[Continued.]

20,930. If a statement was made a few weeks ago there was no scheme prepared it is not correct?—I should not say that. You will hear from the gentleman who took part in it. I do know that scheme was commenced in October, 1916, or, rather, a Committee was appointed in 1916 to elaborate a scheme for improving the relations between owners and workmen and the future conduct of the industry.

20,931. Your scheme is simply a kind of co-partnership?—That is the underlying principle.

20,932. You do not suppose Yorkshire people would accept any such scheme as that, do you?—I do not know; it is for them to say. If you do not adopt some method of that kind and if you are told that you must discuss some new method, what other is left?

20,933. Let me ask you this: What power would workmen have to say it is going to be a success or not when, as you know, in Yorkshire in many pits there is fictitious capital put into the pits. You know some places where a shareholder has two shares and they give him a bonus or dividend and instead of having two shares they call it three?—I should not call that fictitious capital. That capital must have been capital accumulated out of profits and that must appear in some shape in the shape of additional sinkings or in development.

20,934. Take if you like one particular colliery, and call it B without naming it. In five years every man that had three shares has had his shares made into five, and he has had a dividend of not less than 25 per cent. Is not that fictitious money?—I should not be inclined to say that; but again I do not want to get into an argument about the scheme because I have not been in it in preparing it. As I understand what is intended is the true capital of the concern, whatever it may be. Mr. Bramwell will tell you. He has threshed it out.

20,935. This scheme that is outlined here simply means that we ultimately get to an umpire; he has the final settlement of any difference?—I suppose in any transaction you must either arrive at an agreement, or you must provide for a method of settling your difference.

20,936. Do you remember the case of Hemsworth, when we went to arbitration in Yorkshire? We went and got a decision?—That is West Yorkshire?

20,937. Yes; but you see you are representing the Coal Owners' Association?—At the same time I am not omniscient.

20,938. We went to arbitration at Hemsworth; and in less than three weeks the Company closed the pit and said that they would not have the umpire's award?—You never found me in a question like that.

20,939. Now take the case of the Ravensworth Colliery—there we went to arbitration, and because the umpire did not give what they thought he ought to give, they closed the pit again, and the owners' Association supported him?—That is quite outside of my district; but I know that the South Yorkshire Coal Owners did not support him.

20,940. The South Yorkshire Coal Owners have run away from the decisions of umpires. Do you not know that you ran away from Sir Edward Clarke's award? He awarded 7s. 3d. per day and you said "No, we will not pay it; we will close the pits"?—That is opening up a controversy that is too complicated to go into before this Commission.

20,941. You put your case before Sir Edward Clarke, and Sir Edward Clarke gave 7s. 3d. minimum, but your people said, "No, we will not have it"?—That being so, it is only fair to give briefly our answer. We had given an advance in minimum wage through the Conciliation Board. Having given that advance through the Conciliation Board, application was made to Sir Edward Clarke for the alteration of the statutory minimum. We pointed out to Sir Edward Clarke that we had already given through the Conciliation Board what we were then asked to give. He said in effect, "I have nothing to do with what you have done voluntarily; I fix a statutory minimum." We said, "Then that being the case, we are not going to pay both." The result of it was that there was a stoppage, and we eventually came to an agreement.

20,942. I do not think you would wilfully misquote our position?—I think not.

20,943. The position was that either party had a right to go to Sir Edward Clarke after a certain period?—Quite right.

20,944. And as a matter of fact the agreement was that any advance given by the Conciliation Board would come under minimum wages?—The minimum wage was increased.

20,945. And it was also reduced twice by the Conciliation Board?—Certainly.

20,946. It acted both ways?—Yes.

20,947. It was simply that because you had not got your own way you would not have it? Do not you know that in Yorkshire we have decided that we are not going to have any recourse to arbitration?—I have no doubt you have.

20,948. Mr. R. W. Cooper: You were asked some questions by Mr. Herbert Smith about technical matters like fires and safety lamps, and you were asked a question about the Doncaster coalfield. I suppose in the course of your experience you have come into contact with mining engineers practising in other parts of the British coalfield as well as Yorkshire?—Yes.

20,949. Without making any invidious comparisons, have you found the mining engineers in Yorkshire quite up to the standard of British engineers?—Naturally, I should say they were first.

20,950. Have you in your neighbourhood an institution of mining engineers?—Yes.

20,951. Similar to the North of England Institution of Mining Engineers?—Just on the same lines.

20,952. Do the members meet periodically; and read and discuss papers?—Yes, they meet, I think, monthly. It is a very extensive association: it is called the Midland Institute and it embraces not only Yorkshire, but also the Derbyshire and Nottinghamshire coalfields as well.

20,953. And do, as they do further north, if any member has any new idea to communicate, make that the subject of a paper which is read and discussed?—Yes.

20,954. You were asked about safety lamps, electric lamps and so forth. Of course, you are very familiar with the Mines Act, and you would be aware that by Section 33 of the Mines Act all safety lamps introduced into a pit after the 1st of January, 1913, must be approved by the Home Office?—Yes.

20,955. You were asked a question about the water pumping arrangements that you carry out in Yorkshire. Did you prepare a Parliamentary Bill?—Yes. I was busily engaged in preparing for the Bill.

20,956. What happened to the Bill?—Well, when this enquiry commenced, of course, that and everything else stopped till we can know where we are.

20,957. You are now in a condition of suspense, are you?—Yes.

20,958. You were asked a question with regard to a number of collieries who were parties to that pumping arrangement, most of which you said were successful concerns?—Yes.

20,959. Am I correct in supposing that the shares in each of those companies are of a small denomination—£1 shares?—Yes. The rule is, all through South Yorkshire really—there may be an exception or two—but the rule is £1 shares.

20,960. Are they publicly quoted on any local stock exchange: Sheffield, for example?—Some of them.

20,961. Are some of the more successful concerns publicly quoted?—Yes.

20,962. Is it open, therefore, to any members of the public, if shares are being sold, to go into the market and buy them?—Certainly, if he thinks it worth while.

20,963. So that if our friends in the Yorkshire Miners' Association cared to invest in these publicly quoted companies, all they have to do is to instruct a stockbroker?—I know of no reason at all why they should not.

20,964. You also said that, although the same persons probably held shares in most of these companies, yet nevertheless there were a considerable number of holdings in the company?—Yes.

20,965. From your general knowledge of South Yorkshire companies, do you think that, taking the South Yorkshire companies as a whole, the shares are held by a large or small number of shareholders?—

22 May, 1919.]

MR. FREDERICK PARKER RHODES.

[Continued.]

By a considerable number, and I may say, with regard to that, that I cannot understand one figure that has been put before this Commission. There has been a figure repeatedly mentioned of 37,000 as being the total number of shareholders in collieries. I do not believe it is correct. I asked that some steps might be taken to try to check it, because, looking at my own knowledge of what they are in South Yorkshire, I thought there was an inaccuracy, and at the present moment, with returns only from three-fourths of the output, they have arrived at over 200,000 names. Some of those, of course, would be duplicates, no doubt, but it satisfies me that that suggestion that the total number of shareholders is limited to 37,000 requires consideration and careful examination at any rate, if it is accepted as a figure which has any material bearing on the labours of the Commission.

Chairman: We will have that gentleman called: What happened on that was that a return was asked for, and the return was sent from Somerset House and was circulated, but after what Mr. Rhodes has said, I certainly will have the witness here and will ask him questions.

Mr. R. W. Cooper: We had better try to get at the facts, if we can.

Witness: There may be confusion in this respect. There are, of course, a number of concerns which own both collieries and other properties. For instance, if you take the great firm of John Brown and Co., who are armour plate makers, iron founders and shipbuilders, they also own several collieries, and it may be that they are not included in a return of that kind.

20,966. *Chairman:* We are very much obliged to you for calling our attention to what is quite an important point, and I will get the witness here to see what the exact facts are?—I merely say that it requires a little careful consideration.

Chairman: And I say that it shall have it.

20,967. *Mr. R. W. Cooper:* You were asked a question about what I will shortly call "watering" capital. The capital that you were thinking of was the true capital of the concern?—Yes.

20,968. May I take it that the nominal share capital of a concern is by no means necessarily the true capital of a concern?—Not at all: it is very often more than its value, and very often less. Unfortunately I have not been in a position to be able to carry out any watering of capital, but if it takes place, it ought, when it is finished, to represent the true capital at the time.

20,969. We know the difficulties since the war began. You were asked about the introduction of cutting machinery. Am I right in supposing that the true object in introducing cutting machinery is to increase the output?—Yes, it increases the output, and in my opinion you get that where coal requires holing by the men, and when you can set a machine to do the holing that the men would do; but you can only use it, of course, under circumstances where a machine can be used.

20,970. And that depends on the conditions of each pit or each particular seam?—Naturally, or part of a seam.

20,971. This is very elementary, but I suppose one of the effects of increasing output is to reduce the cost of production?—Undoubtedly.

20,972. So that you get more coal to sell, and the original quantity of coal is produced at less cost?—You reduce your standing charges.

20,973. Now leaving the question of companies alone, I want to ask you a further question: I suppose in the course of your practice in South Yorkshire, being a royalty owner yourself, you have some idea of the number of owners of royalties in South Yorkshire. Are they numerous?—A considerable part of the South Yorkshire area is in comparatively few hands, but there is a large number of freeholders and persons owning smaller coal areas. That applies particularly in the newer part of the coalfield. When you get past a distance of about five miles south or east of Doncaster, you have very little in the way of large estates. They are nearly all freeholders.

20,974. You mean people having comparatively small estates?—Yes.

20,975. Have you cases in South Yorkshire, for example, of a coal area being held by several persons in undivided shares?—I do not know of one in South Yorkshire. I know that they do exist occasionally, but I do not know of one in South Yorkshire.

20,976. I observe in the pamphlet you read, it is stated there, speaking of a time before the war, that there are 8,000 recipients of coal royalties?—There again I cannot help thinking that that figure must be inaccurate. It looks to me, if that is an Inland Revenue figure, as if it had been arrived at by taking the total number of persons who paid mining rights duty, but that by no means indicates the total number of owners of minerals—not by any means; and I ought to say this, that personally I cannot see any difference between the case of an owner of minerals who at the present moment is deriving income from his minerals, and the case of an owner who will shortly begin to derive income. Possibly my opinions on the subject may be prejudiced, because they affect myself; but using the knowledge and judgment that I have, such as it is, I invested my savings (and they were the result of hard and continuous and grinding work) in the purchase of mineral property. I have waited for years and years for that to materialise. It now has materialised; it is just let. I—as I think all right-minded lessors ought to do—gave the lessee plenty of time to develop: I fixed a nominal rent: nothing at first, and then a comparatively nominal rent of £50, and then gradually rising over a period of years, extended so long that under no possible circumstances could the certain rent be an injury to the lessee. But it appears to me to be wrong to say that because I did that that the State should step in and say, "We take your property and pay you nothing for it, because you are not getting an income from it at the present time."

20,977. I am not suggesting that that would happen from what is stated in the pamphlet to which I refer. It is proposed in the Miners' Bill.

Mr. Herbert Smith: Could you get evidence of that Miners' Bill?

Mr. R. W. Cooper: It has been circulated.

Mr. Frank Hodges: It has been our invariable custom not to quote *précis* before they are sworn to.

Mr. R. W. Cooper: But your own witnesses have spoken about it.

Witness: Please do not ask me about them, because I have forgotten one, and I have not had an opportunity of studying the other.

20,978. *Mr. R. W. Cooper:* Assuming that the mines and minerals of this country were to be nationalised, what do you say as to the principle upon which the owners ought to be dealt with, first as regards royalties and, secondly, as regards what I may call the colliery interest held by lessees?—I think myself that the principle of compensation is the same in the case of the royalty owner as it is in the case of the colliery owner, and that if it becomes necessary to expropriate his property for the necessities of the nation—and I do not mean merely for the pecuniary profit of the nation, but for the necessities of the nation—then he ought to be paid the true market value of the property, whatever it is that the nation proposes to take, and you cannot, in laying down any rule to-day, lay down a rule that will fetter the tribunal which eventually has to decide what that value will be without committing an injustice in one way or the other. Suppose, for instance, as has often been suggested, you took it on an annual value: the annual value is no guide at all. Take the case of a mineral owner whose estate is nearly worked out. At the present moment he is receiving a large income, but in 7 or 8 years it will come to an end. Then take the converse case, like the one of my own which I have just mentioned, where it is only just let. There the true value is in the future and the past has nothing to do with it; and I would say this, that if the necessities of the nation, and not the mere desire to acquire somebody else's property compulsorily and make profit out of it—if the necessities of the nation compel the acquisition of the property of

22 May, 1919.]

MR. FREDERICK PARKER RHODES.

[Continued.]

any private individual, then the State, for its own interest, ought to make sure that he is not robbed, but that he is paid the full fair value of the property which is taken from him by force and against his will.

20,979. From that I gather that you altogether deprecate the idea of fixing any overhead sum per ton of output?—You cannot do it and do justice.

20,980. I suppose it must be obvious to all of us that you may have a property with a short life or you may have a property with a long life. It would be altogether unfair to apply an overhead ton rate for those properties?—I know of collieries at the present time in my own district where I should think the sum expended up to the present moment must approach three-quarters of a million, and the output at the present time is comparatively trivial. They will have to expend half as much more—and I should think they would get off cheaply with that. Their value is in the future value of the concern. You cannot lay down any overhead system that would apply to everybody alike, not if you wish to do justice. You may utilise it as a means of making a guess at the value.

20,981. A guess at the whole value of the country, but not as regards each unit?—No.

20,982. I take it that, of course, the capital value of each colliery varies: one colliery may be worth a bigger sum per ton with less output than another?—Naturally. The most valuable colliery is really the one with the largest output that has been sunk and equipped with the least cost.

20,983. You are familiar, no doubt, with the way in which the State assesses Estate Duty on real property?—Yes.

20,984. Is it not a fact that the Finance Act of 1894, for which Sir William Harcourt was largely responsible, expressed it that the true value of any property shall be estimated to be the price which, in the opinion of the Commissioners, such property would fetch if sold in the open market?—Yes.

20,985. On that principle the State assesses the Estate Duty on minerals and collects the duty?—It does.

20,986. In other words, it is upon that principle that a person succeeding to mineral property buys back from the State the share of the property which the State takes on the death of his testator?—That is so, and any person in the same position as myself, who died to-day, his successors would have to pay estate duty on the full value of that mineral property.

20,987. In fact, they would have to pay the share of the estate which the State claims to be entitled to?—Yes.

20,988. You remember the Mining Royalties Commission which made a report in 1893?—Yes. I and Mr. Alfred Barnes were appointed on that Commission to represent the interests of the lessees in the Midland and Yorkshire coalfield.

20,989. I think I may say, if I may use the expression, that that was a well constituted Commission?

Chairman: All the Commissions are.

20,990. Mr. R. W. Cooper: I hope they are. I will assume they are. The royalty owners were represented, the colliery lessees were represented, economists were on the Commission, Labour was represented on the Commission?—Yes.

20,991. And the State was on the Commission in the persons of Lord Northbrook and Lord Macnaghten?—Yes.

20,992. You have told us in your *précis* that at first you and your colleagues were not absolutely unanimous with regard to the proposals put forward?—Naturally some approached the subject with rather strong views.

20,993. But the result was eventually a unanimous report?—It was.

20,994. May I ask, as a matter of curiosity, who drafted the report for submission to your colleagues?—We had a very able secretary in the person of Mr. Lyoa. Our Chairman, Lord Northbrook and Lord Macnaghten were also upon it, and the report in the first instance was drafted by Lord Macnaghten and Lord Northbrook, with the assistance of Mr. Lyoa. It then came in rough draft before the Commission,

and if I remember right, we spent nearly a month on that report in going through it before it assumed its final shape.

20,995. One important conclusion was that you found unanimously: "We are of opinion that the system of royalties has not interfered with the general development of the mineral resources of the United Kingdom or with the export trade in coal to foreign countries"?—Yes, that is so. We found that as a general fact, but I ought to say that we did also find, as, I think, you always would find, that there were occasionally cases which required remedy.

20,996. I am coming to that in a moment. That is your finding in March, 1893, that is 26 years ago?—Yes.

20,997. Has your experience since that time caused you in any way to alter that opinion, so far as you yourself are concerned?—No.

20,998. Now, the next of your findings was the third finding: "We do not consider that the terms and conditions under which these payments are made are, generally speaking, such as to require interference by legislation, but we recommend that some remedy should be provided for cases in which a lessee may be prevented by causes beyond his own control from working the minerals he has taken, and also for cases of certain restrictions upon the assignment and surrender of mineral leases." Then the fourth is a subject we have touched upon to-day: "We are of opinion that where the surface belongs to one person and the subjacent minerals to another, greater facilities should be provided for the working of the minerals." That is practically what you have suggested here to-day?—Yes.

20,999. Which, I think, is also found more fully in the 92nd paragraph of that same report, on page 22. What you have suggested to us here to-day is, in effect, what you and your colleagues found 25 years ago?—Yes.

Mr. Robert Smillie: Will you tell us what they found?

21,000. Mr. R. W. Cooper: Yes: "We think that where the surface belongs to one person and the subjacent minerals to another, and the surface owner, having the right of support, claims an injunction on the ground of threatened injury to his property, the Court ought to be empowered to exercise a discretion somewhat larger than that which it appears to possess at present. Where the injury is likely to be trifling, as in the case of waste land, or capable of being repaired, as in the case of agricultural land, and generally where the Court may be of opinion that the interests of the surface owner may be adequately protected without enforcing his extreme rights, we think the Court should be authorised to permit the mine owner to go on with his mining operations upon terms which would ensure to the surface owner ready information as to the progress of the workings and ample security for the payment of compensation."—Yes. As the law stood, and stands, of course, the surface owner could apply for an injunction to prevent the working of the mine, and in some cases it is right that he should be able to do it. If you take the case that I have mentioned of the Doncaster property, or take my own small property, you may work the coal under the greater part of that and nobody could tell that it had been worked unless you have a fixed point to measure from; but on the other hand there are about 300 acres on the south side of that where, if you worked it, you would immediately turn it into a swamp, because it is down in the old fen level, and you would not only destroy that, but you would destroy the adjoining land as well, because you would upset the drainage. There the surface owner has undoubtedly a right to be heard in his own interest, and I think the remedy eventually will be to take over his land if you are going to destroy it.

21,001. Under Lord Cairns' Act the Court of Chancery has an equitable discretion in determining whether to award damages or to grant an injunction?—That is so.

21,002. The Court, after hearing all parties, exercises its discretion?—In the case that I have mentioned the Court would never exercise its discretion.

22 May, 1919.]

MR. FREDERICK PARKER RHODES.

[Continued.]

21,003. *Chairman*: What was done in consequence of this Royal Commission?—Nothing at all; it went to sleep, and I have always regretted that nothing was done to give effect to it.

21,004. *Mr. R. W. Cooper*: You have talked about the development in South Yorkshire. You have a very good memory; can you give us any idea from your own personal knowledge of the number of new collieries established there during the last 20 years?—I should have to think a little. The best illustration I can give you is this. When I was a boy, I should think the total output of South Yorkshire did not exceed 3,000,000 tons; to-day it is 28,000,000 tons. At that time we were a mere insignificant coal-field as compared with Durham. To-day the County of Yorkshire is equal to Durham.

Mr. Herbert Smith: Would you ask him how long it is since he was a boy?

21,005. *Mr. R. W. Cooper*: Yes. (*To the Witness.*) Now I have to ask you a personal question; how long is it since you were a boy?—It depends on when the boy ends and a man begins; but it is sixty years ago any way.

21,006. Broadly speaking, in the last 20 years have there not been a large number of new collieries established in South Yorkshire?—Yes; and it is only fair to say, with regard to one who is dead and gone, that a great part of the credit for the development which has taken place is due to the late Sir Arthur Markham. He was a man of intense energy, and he would not rest unless things moved forward. He, I think, had a great deal to do with the driving force in the development of that coalfield.

Chairman: I am much obliged to you for your evidence.

(*The Witness withdrew.*)

MR. HUGH BRAMWELL, Sworn and Examined.

Chairman: Mr. Bramwell is a gentleman with very large experience in South Wales, and I am going to pursue the same course that you have been good enough to sanction with respect to the last witness. I will ask Mr. Frank Hodges to examine on my left, and Mr. Evan Williams, who represents South Wales, to examine on my right. Mr. Bramwell says: "I am a mining engineer of 40 years' experience; agent for and a director of the Great Western Colliery Company, Limited, producing one million tons of coal per annum; past President of the South Wales Institute of Mining Engineers; past Chairman of the Monmouthshire and South Wales Coal Owners' Association; and a member of the Coal Controllers' Advisory Board."

21,007. (*To the Witness.*) I will ask you now to be good enough to read to us your proof.

Witness: "I wish in the first place to draw attention to the difference in functions and duties of ownership and management. Ownership in the past has meant financial ownership and financial control. For each undertaking ownership provides the policy and the means, but having appointed its agents and managers and given its directions to them, it takes no part in carrying out these directions. Management having taken its directions has to act according to the means provided, and to be responsible and effective, it must be unfettered. Depending on the size and character of the undertakings, mine management may be divided into a producing and a disposal side. Private owners, who do not themselves direct, appoint directors or a managing director. State ownership would probably have to operate through District Boards, but management should, to be efficient, remain the same. I have been directly connected with the management of coal mines since 1878, and have acted as under-manager, certificated manager and agent under the Coal Mines Regulation Acts, and have had experience as a director of the duties of ownership.

I am convinced that the only way to manage a coal mine is to appoint qualified officials who are responsible for their actions and who must not be interfered with in the discharge of their duties. Any interference with such persons must relieve them from responsibility, and must render their position ineffective. This is the essence of good management and applies whoever owns the mines.

It must always be remembered that a mine is changing from day to day, and prompt action is necessary. A mine is not like a factory.

As regards "Safety" the Mines Act, 1911, is based on "this principle." This Act was introduced and passed after long enquiry and discussion, its object being, as far as possible, to ensure safety and to fix responsibility upon the owners and their managers. The Certificated Manager, under the Act, is the responsible person, not only for his own actions, but for the actions of those under him. The responsibilities of the management are defined by the Coal Mines Act, 1911, and by that of the previous Acts of 1887 and 1872, and may be set out as below:—

Section 2 (1). Every mine must be under one manager who is responsible for the control, management, and direction of the mine.

Section 2 (4). The owner or agent of mine is prohibited from taking any part in the technical management of the mine unless he is qualified to be a manager.

Section 3 (1). Daily personal supervision must be exercised by the manager, and also where there is an under-manager, by the under-manager.

Section 5 (1). A manager must be at least 25 years of age and the holder of a first-class certificate of competency.

Section 5 (2). An under-manager must be the holder of a first or second-class certificate of competency.

Section 14 (1). The manager must appoint, in writing, firemen examiners, or deputies, to make the inspections required by the Act and the regulations.

Section 15. Every fireman, examiner, or deputy, must be the holder of a special certificate, must be 25 years of age or upwards, and must have at least five years' practical experience underground, of which not less than two years must have been in the face. These firemen, examiners, or deputies, have most important duties imposed upon them under the Act, and the word "deputy" shows that their extremely responsible duties are exercised on behalf of the manager in the several parts of the mine assigned to each of them.

Section 16 (1). The workmen are authorised to appoint two examiners of their own to make periodical inspections.

Section 16 (2). These workmen inspectors must make a report of the result of each inspection in a book to be kept at the mine, and a copy of the report must be sent to the Inspector of the Division.

Section 17 (2). Every person having responsible duties must make reports and copies of the reports must be posted up at the pit head for the information of the workmen who are then in a position to call the attention of the manager or the inspector to any source of danger which may or may not be reported.

The Act contains specific provisions with respect to safety under the heads of ventilation, safety lamps, shafts and winding, travelling roads and haulage, and in this connection a restriction is placed by Section 43 (2) on persons being conveyed underground in tubs, support of roofs and sides, signalling, machinery, and electricity, the use of which is by Section 60 (1) prohibited where there is any risk of explosion of gas or coal dust. If any person contravenes any of the provisions with respect to safety the owner, agent, and manager are each deemed to be guilty of an offence. In like manner by Section

22 May, 1919.]

MR. HUGH BRAMWELL.

[Continued.]

90 if any person who is bound to observe the regulations of the mine contravenes them, the owner, agent, and manager, is similarly deemed to be guilty of an offence, and the only defences the owner, or agent, can raise under the Statute are that they were not individually in the habit of taking, and did not take, any part in the management. That they had made all financial provisions necessary to enable the manager to carry out his duties and that the offence was committed without the knowledge, consent, or connivance. Both the High Court and Courts of Summary Jurisdiction have exceptional powers conferred upon them, the High Court being entitled to prohibit by injunction the working of any mine or part of a mine in which there is any such contravention of the Act or the regulations as may appear to the Court calculated to endanger safety, while by Section 103 a Court of Summary Jurisdiction, on the complaint of an Inspector may, on being satisfied that any part of the machinery or plant used in a mine is in such a condition or so placed as that it cannot be used without danger, prohibit its use. In addition there is a large number of Orders in Council imposing further specific obligations. At present the owner or the owner's agent appoints the certificated manager, but neither the owner or owner's agent is by law allowed to take part in the directions required under the Mines Act, 1911, and thus share the manager's responsibility, unless he is also the holder of a manager's certificate. In such matters the agent is a consultant for the manager, he does not himself act, but, being a consultant, shares in the responsibilities of the manager's actions. I can conceive nothing more likely to destroy efficient management than interfering in any way with the responsibility of the manager. A management committee that directed the manager, or formed a body to whom appeal against the manager's actions could be made, would have to take responsibility, and each member of it would require a manager's certificate. Even if that were feasible, each member could not individually be held responsible, and the management would result in mismanagement. It would be the same as making the captain of a ship in distress subject to a committee of the crew, or the command of a regiment in battle subject to a soldiers' committee. The result could only be inefficiency and possible disaster. For some years the workmen in some districts have attempted to interfere with the manager in matters of "safety." A pamphlet entitled "Towards a Miners' Guild," printed about 1916 (?), is the basis of their action. Its object is the destruction of private ownership, and the means advocated are "safety strikes," to render management impossible, so that eventually the workmen should obtain control of the management, and eventually of the mines.

In order that you may appreciate the spirit in which the management is met by the section of the workmen who at present controls the workmen's local lodges, but I do not say that the responsible miners' agents approve of this, I give some extracts from the pamphlet referred to."

21,008. *Mr. R. H. Tawney*: Will you first tell us who it is by?—It is published by some guild in London.

Chairman: "Printed and published by the Victoria House Printing Co., Ltd., Tudor Street, Whitefriars, London, for the National Guild League."

21,009. *Mr. R. H. Tawney*: Is it published by the miners?—I have no idea. It was sent to me by a shareholder of a company I am connected with, who asked me what I thought of it.

21,010. *Mr. Robert Smillie*: Is he the author?—No. It is published by the Guild.

Chairman: A society called the National Guild League.

21,011. *Sir Arthur Duckham*: Is that a responsible society? Is it worth while having this document published?

Mr. Robert Smillie: I think it might be circulated for the information that it contains.

21,012. *Sir Arthur Duckham*: Would it be put forward as evidence?

Chairman: I do not know; I have never seen it before.

Mr. Robert Smillie: It is now in as evidence.

Witness: I put it in as evidence. That is the only copy I have ever seen. It was sent to me by a shareholder in my own company, who asked me what I thought of it, and from the results in South Wales I think it has had some effects. I will describe those later.

21,013. *Mr. Herbert Smith*: Are you inferring that the miners are responsible for this?—I have no idea.

21,014. Are you inferring that?—I think I am, because the experience in South Wales is that the things advocated in that pamphlet have been applied.

21,015. *Sir Adam Nimmo*: Could the document be printed as an appendix to the Witness's evidence?

Witness: I should like to make some quotations from it.

21,016. *Chairman*: Please do so.

Witness:

"Page 3. Their one objective, the control of the mines by the miners and their ownership by the State.

Page 6. State ownership and control of the mines was until quite recently the aim of the Miners' Federation of Great Britain.

Page 7. To Mr. Robert Smillie—(as to many another miners' leader)—the State is no longer sacrosanct—and, if need arises, organised labour must be free to fight the State.

Even without nationalisation the miners of this country have "to put up with" a great deal of State control.

Page 8. The Bill for the Nationalisation of Mines introduced into the House of Commons on behalf of the Miners' Federation of Great Britain . . . would hand over the control of the mines to bureaucrats appointed by the State.

Page 9. Nationalisation, unless accompanied by union control, may well be disastrous.

The miners must seek, through their union, to manage, organise and control the mining industry.

Page 12. How to get control.

To-day they have the right to appoint a checkweighman. He can become the recognised spokesman for the miners in many matters affecting the management of the mine.

The miners have a limited right to appoint visiting inspectors, and here again they possess a weapon that can be used for interference with the management."

21,017. *Mr. Robert Smillie*: It may be taken that you are not continuing to quote me?—No, your name is only mentioned in one particular paragraph.

21,018. *Mr. Robert Smillie*: I am sorry.

Witness:

"In addition, their power enables them to interfere with the management in many ways which have no legal sanctity. *Safety Strikes* are a good example of such power, and the experience of any working miner will supply him with others.

An illustration:—

Absentee Committees were proposed—the miners suggested Joint Committees, to deal not only with absenteeism, but all questions that might arise between the two parties.

Page 13. The mere dislike shown by the owners for this proposal should recommend it to the men.

Page 14. The object should be to transform the existing machinery of conciliation into machinery capable of exercising control.

In the first place, it is essential to abolish the impossible 'impartial' Chairman.

This process, by a series of steps, can be carried further and further, till the mine manager holds his office by appointment as the nominee of the Miners' Union.' That is the end of the quotations.

22 May, 1919.]

MR. HUGH BRAMWELL.

[Continued.]

Now, so long as such a spirit exists, I submit that management by Committees is altogether impossible, and I further submit that even with the best of spirit, Committee management is bound to be the most inefficient form of management. There have been a number of safety strikes in the coalfields. Safety is relative, and in every case proper action is a matter of opinion—and that must be the manager's responsibility. The same arguments apply to the management of the mine by the agent, manager and officials, from an 'Economic' view, as with 'Safety' view.

The agent's work is not only concerned with the running of the mine at the moment, but as the property is a wasting asset, he has to continually have in view its probable position five or 10 years hence, and to make provision for this. Successful operation depends on this. He has to decide what work is necessary now in order to meet the future. I do not think that any Local Committee could have such knowledge of the position and requirements of each mine in its district as would enable it to decide such matters and the result would be inadequate or excessive present expenditure, the former followed by periods of 'rush' and extravagance; the latter by direct loss.

The condition of a mine is changing from day to day, in addition to normal coal production the manager decides what work is necessary, when it should be done, how it can be most economically done without interfering with the running of the mine and having regard to the labour normally available he sets the order of precedence of different items of work. All these are matters of opinion, and no management committee is likely to arrive at so true a decision as the single responsible and trained expert.

Mining is a speculative industry, and whilst many major and minor developments turn out all right, and justify the expenditure on them, there are many failures where reasonable anticipations are not fulfilled. I do not think a committee, even if all were experts, could do as well as the single responsible man. After knowledge and judgment mining requires boldness.

Officials must have the power to enforce discipline without appeal. There may be some few cases of injustice. It is better that there should be than discipline be relaxed. I am certain that would follow if a manager's action was open to appeal to a committee. The manager must engage and dismiss both his officials and men if he is to have control of them. Minor strikes of workmen on this question are not uncommon. A manager knows that he cannot be unjust without risking the stoppage of the mine—consequently when he does act, he does so under a sense of responsibility. I do not think any part of the actual management could properly be subject to a Pit Committee, however they were constituted, or that any manager that had any respect for his mine and the safety of his workers would share responsibility. A Pit Committee could only be advisory—it could not have executive powers—and its members must have the good of the mine and the trade in view, and not merely the advancement of the position of one section of the community at the expense of another.

I do not think that in a complicated business such as mining that Nationalisation would succeed. It is a business of adventure, varying largely in every district and part of each district, in which risk must be taken on the chance of exceptional reward, otherwise there will not be development.

With Nationalisation, I assume that it will be the desire of all that the managements should be efficient, and I have pointed out how this can only be retained.

I look upon the collieries separately from the minerals as a 'State asset' now. Under private ownership the output has doubled in 30 years, new coalfields have been opened, and over the whole trade these owners appear to have taken out of this speculative business some 9 per cent. on their money as a gross return to cover interest, depreciation and other charges (without taking into account the heavy losses that individuals have from time to time incurred). Further, part of this 9 per cent. has been put back again into the industry by way of development. The State would hardly be expected to take such risks. It might waste money on sensational schemes to meet uninformed clamour, like the petroleum borings now going on in Derbyshire; but I doubt whether the State would or should have taken the risks necessary to develop the coal industry, as has been done by private ownership. That is why I regard the mines now under private ownership as a 'State asset.' They will be of no mere value for the nation under State ownership. If the State buys out the private owners and hands over the control to any other body, they will be committing a breach of trust with national monies. They must take the responsibility of control, otherwise the State will only be finding the means to provide work for miners and management, and no asset of value will remain.

I think nationalisation will, in any case, reduce the value of this State asset by:—

- (1) Doing away with the accumulated knowledge and experience of directors;
- (2) Taking away the spirit of initiative and emulation in the management;
- (3) Removing the incentive for effort on the part of the men.

The output of the country may continue to increase for some years yet; but will, in my opinion, increase more rapidly with private ownership; but the value of the mines will, if nationalised, decline and may vanish, unless the miners themselves put in part of their earnings and invest this in the industry, as the owners do now. The miners could quite well do this now: there is nothing to stop them.

If, under State ownership, the surplus from the industry disappears, the Government will either have to tax other industries to meet the mines' indebtedness, or will be obliged to raise the price to consumers. It is nearly certain consumers will in the end have to pay more than they would have to do under private ownership.

Directors' fees may be saved: I put this at £250,000 a year—the Inland Revenue witness put it at £700,000 a year, but did not state whether this was for coal mines only, or for joint concerns. The estimate for the present Coal Controllers' office for the year is some £500,000, and this is a trifle compared with the probable cost of Central State Control and District Boards. The colliery staffs will have to be increased, as the Boards, being apart from the mines and selling departments, will require voluminous statistics and reports.

Unless it be by confiscation, I cannot see any advantage to the State in nationalising the minerals themselves. All the possible and probable savings in barriers, loss in working, development, &c., can be attained under private ownership. The disadvantages of private ownership as regards land (the surface) has been met by the Lands Clauses Act, the Railways Clauses Act, and by recent recommendations. There is no reason why the minerals should not similarly be dealt with. If this were done, what object would be served by the State purchasing? At the moment it is immaterial to me, at any rate, how the minerals came into private ownership. They are legally in private ownership, and taking them without compensation is confiscation."

(Adjourned for a short time.)

22 May, 1919.]

MR. HUGH BRAMWELL.

[Continued.]

21,019. Mr. Frank Hodges: I note your *précis* contains largely a *résumé* of the Coal Mines Act with which I think we are all acquainted, and a considerable number of quotations—14, I think—from a pamphlet, entitled "Towards a Miners' Guild." Have you nothing substantially constructive to offer outside those two propositions to solve the great difficulty with which this Commission is faced?—The proposals that we put forward by Lord Gainford I am open to explain so far as I can.

21,020. The last time you were in the chair, I think, you felt that you had nothing of a constructive character to place before the Commission?—Yes.

21,021. Am I to take it that the Commission is to understand that the constructive proposals of the Mineowners' Association are embodied in their entirety in the *précis* of Lord Gainford?—The principles, but not in their entirety.

21,022. Are there others?—There are any amount of details which will have to be settled.

21,023. Have you given any attention to the details?—We have discussed them, but they are really a matter that will have to be settled between the men and the owners very largely before any scheme of profit-sharing can be put into force.

21,024. Do you not think it is the function of this Commission to have all details before it, so as to see whether the details which are proposed fit in with the principles?—I think it would be very difficult for this Commission to lay down a scheme of profit-sharing without referring it to the different districts to which it has to apply.

21,025. I think you will agree with me that the principle of profit-sharing depends very largely for its success upon the character of the details?—No doubt.

21,026. I propose later to see to what degree you have thought of details for the coalfield which you more particularly represent, but for the moment I will just put one or two questions to you which arise immediately out of your *précis*. You say on the first page that in reality ownership merely performs the function of providing money capital?—That is its particular function.

21,027. And the reward for that provision is profit?—Undoubtedly.

21,028. Do you say that that is the motive which is behind the industry at the present moment?—Do you mean profit?

21,029. Yes?—Undoubtedly that is the object of the industry.

21,030. And whether the community benefits or does not benefit, if profit is made, then the industry performs its purpose?—No, the community must benefit; otherwise it is no good having a profit at all.

21,031. But if the motive is profit, are you concerned whether the community really benefits?—Certainly, the State must benefit altogether by the fact of the industry being carried on profitably.

21,032. But is that your concern? Have you a concern with that?—I am a member of the State, and therefore it is my concern.

21,033. But you are a member of a colliery company which works for profit?—True.

21,034. Which do you think occupies the principal place in your mind?—I do not think you can divide the two.

21,035. Then I understand from your answer that profit really is the motive in the industry?—I think it is in all industries.

21,036. Yes, I agree, and I do not doubt that. Ownership, after it has provided its capital, really ceases to function?—So far as the actual management of the collieries is concerned, that is so.

21,037. So that it is the management and labour involved in the industry which makes the profit possible?—Under the direction of the owners.

21,038. Do I understand that it is your view that happy relations will be established in the industry if the labourers or workmen, as distinguished from the owners, share in the profit?—I think a profit-sharing scheme is the best solution.

21,039. How does the community stand in relation to that proposition if it is to the benefit of both the

providers of capital and the management and workmen to share in the profit, and I suppose on the largest possible scale that they can obtain it? Where does the community come in there?—The proposal of the Mining Association definitely says that the wages of the workmen are to be considered in relation to the wages in other industries.

21,040. That does not meet the point I am trying to put. If you now propose that the enjoyment of profit shall pass merely from the providers of capital to the providers of capital and the workmen, how can the community benefit under that proposition?—Just the same as they do now.

21,041. How do they benefit now?—They get coal at a proper price.

21,042. At the proper price?—Yes, the market price.

21,043. How is the market price determined?—By competition, production and demand.

21,044. That is competition between owners, I suppose?—Possibly.

21,045. And the difference in cost at various collieries which very largely determines the price at which you can put coal upon the market?—No doubt cost enters into it.

21,046. But supposing you had workmen who had a special interest in the creation of profit, do you not think the workmen would just complete that alliance for such a rate of profit as would make it impossible for the community to get its coal at the present prices?—No, I think the community will be able to defend itself.

21,047. How could it against that combination?—I think it could.

21,048. How could it? In what way could it?—Well, it is difficult to see exactly in what way it could, but at the present moment the consumer, unless he can get coal at a price which makes it worth his buying, will not buy.

21,049. Therefore his remedy is not to buy?—Yes.

21,050. Does that benefit him?—Possibly not.

21,051. So far as the underlying principle of the profit-sharing scheme is concerned, it amounts to this, does it not, that you could have—I do not suggest you would have—a combination between workmen in an industry such as this and their employers for the purpose of keeping up prices to the highest possible point in order that profits to be shared might be the maximum quantity, and the only remedy against that which the community would have would be not to buy the coal?—Well, it amounts to a question of demand and supply right through, and it would be the same in any other industry with regard to profit-sharing.

21,052. Do you, as a student of men and the community generally, sincerely believe that in that scheme you have the germs of future industrial peace?—I think it is better than nationalisation.

21,053. Have you in that scheme the elements of the industrial peace of the future?—Just as much as with any scheme of nationalisation.

21,054. Have you in that scheme any suggestion or any hope of industrial peace?—No; no scheme can make industrial peace if one party likes to disturb it.

21,055. I am putting this question to you very seriously?—I should like to answer seriously.

21,056. I do not think you are?—I am trying to.

21,057. Let me see if I can elucidate the point in this way. You believe that industrial peace is necessary for the smooth working of industry, do you not?—Yes.

21,058. And the happiness of the community depends upon that?—Very greatly.

21,059. And entirely?—Not perhaps entirely; I say very greatly.

21,060. Any scheme that is put forward as an alternative to the present scheme must provide, so far as it is humanly possible to provide, for such industrial peace?—Yes.

21,061. On that assumption then, let us take our minds back to the realities that exist in this industry. Have you had anything like industrial peace in the South Wales coalfield in the last 10 years?—We have not done badly considering the nature of the industry.

22 May, 1919.]

MR. HUGH BRAMWELL.

[Continued.]

21,062. What do you mean by doing badly? Are you satisfied the number of strikes and stoppages of work that have taken place there could be regarded as normally satisfactory?—They are nearly all in breach of the agreements.

21,063. No matter what they are in breach of, do you regard the state of affairs in that area as being conducive to smooth productivity and continuous productivity?—No, I cannot say I do.

21,064. You had a strike in 1915, did you not, during a very grave period in the history of the war which involved a stoppage of the miners for over a week?—Yes.

21,065. And you will remember, I believe, that that stoppage was due to the fact that an agreement had terminated in the effluxion of time?—Yes.

21,066. The workmen asked for a new agreement to take its place?—Yes.

21,067. And you refused to enter into negotiations for such a new agreement?—I do not think we refused to enter into negotiations.

21,068. I put it to you that you distinctly refused, and your records indicate that you refused?—I do not remember it.

21,069. You offered that the agreement should continue for the duration of the war and that you should give an increase in wages?—Yes, that was our offer.

21,070. And as the result of that stoppage hundreds of thousands of tons of coal were practically lost to the nation?—Yes; but if we had been free and not in a time of war, we should probably have settled.

21,071. No?—I think so.

21,072. You said if you had been free you would have fought the men for a much longer time than you did?—We should have arrived at a settlement.

21,073. No doubt. Even this week, for the last five weeks, you have had a number of workmen on stop, 5,000 in number for five weeks, have you not?—Yes, and it is very disgraceful.

21,074. That is at the Ebbw Vale Collieries alone. I think you have had in other large collieries in the coalfield during the last week or so stoppages involving 1,000 or 1,200 men?—Lots.

21,075. Do you consider that a satisfactory situation?—No; I think the men are taking advantage of their position.

21,076. Let us assume for the moment—which I do not accept in fact—that the responsibility for this stoppage of 5 weeks, involving 5,000 men, and the other stoppages are all due to the workmen?—Yes.

21,077. Do you suggest that under your scheme of profit-sharing that would not occur?—I do not say that the profit-sharing scheme would prevent all disputes or anything like it, and neither will any other scheme, but it is the best we can think of.

21,078. Why have you not thought of this before?—We commenced thinking of it about two or three years ago; I think it was 1916.

21,079. You proceed very slowly, do you not?—We appointed a large committee, and we had to get the whole of the coalfields of the country into it to consider what was to be the position of the coal trade after the war. That was early in 1916.

21,080. That was, I believe, rather to meet the exigencies that would arise out of the war; not so much because of the attitude of the workmen, but because of the position of the trade?—No, it was to do with the regulation of wage.

21,081. The regulation of wage. Have you ever produced any report indicating the progress you made in the development of such a scheme?—Only among ourselves.

21,082. I would refer you to your own evidence that you gave before this Commission the last time you sat in that chair. I do not think you indicated that there had been two years' work on such a scheme as that?—Possibly not. I may not have had it in mind at the moment.

21,083. I think in answer to a question put by myself you said the coalowners were only then engaged upon such a scheme, the details of which you could not give.

Chairman: That appears at Question 7164.

21,084. Mr. Frank Hodges: What did I say there, Sir?—

Chairman: "(A) You are speaking of pit committees that were suggested? (Q) Yes. And they drew up a scheme which would enable them to have the right to make suggestions to the management concerning the underground working, but the Coalowners' Association, when they had the scheme up before them, rejected it, on the ground that it would interfere with the management of the colliery. I put it to you, whether, in the light of the industrial unrest in the South Wales mining district, that step ought ever to have been taken by the South Wales Coalowners' Association?—(A) The proposal came from the Coal Controller, with a view of increasing production during the war. The owners were anxious to do all they could, but when it came to discussion at the individual collieries with the workmen's representatives, we came dead up against the question of management, and it was found that the workmen's committees, as was hoped for and intended by the local workmen's committees, at any rate, were going to be a management committee, and not confined to the objects that the Coal Controller proposed. (Q) I agree. They even went so far as to propose to change the title of the scheme, and instead of calling it an Absentee Committee, I believe they described it is an Output Committee?—(A) Possibly; there were all sorts of proposals." Then it goes on, and Mr. Hodges puts his case, and at Question 7172 there is this: "(Q) But is there not some object in getting the men to co-operate with them in getting increased output?—(A) Yes, we would like it, on certain lines. (Q) What lines?—(A) As long as it does not interfere with the authority of the management; that was where the crux came." You are quite right, Mr. Hodges.

21,085. Mr. Frank Hodges: That is not quite the point I was trying to make. I have not the records of the First Stage before me, but I remember asking Mr. Bramwell if the coalowners, or he himself could put forward some constructive scheme for the future conduct of the industry, and he said the coalowners then had the matter under discussion. The "Times" published what purported to be a scheme of the coalowners, and I asked Mr. Bramwell if he associated himself with that scheme.

Chairman: Yes, you are quite right.

Witness: If I may be allowed, I will partially correct that. It was early in 1916 that the Mining Association decided that their relations with their workmen could not be the same after the war as they had been previously, and they appointed a committee to consider what was the best arrangement to make. That committee sat for a number of meetings, and found that they had different opinions, and they appointed a sub-committee who did draw up a scheme both on the productive and on the distributive side. When that proposal came again before the Mining Association, the part on the distributive side was wiped out, and the part on the productive side was modified. They have been at it ever since, trying to arrive at some scheme that they could put forward, and their present proposals practically amount to a profit-sharing scheme as has been described.

21,086. Mr. Frank Hodges: Am I right in assuming that the scheme to which you made a vague reference in your answer to Question 7162 was afterwards rejected by the Mining Association of Great Britain?—There have been so many proposals made and rejected that I would not like to answer definitely, but the proposal now before us is the owners' way as to a profit-sharing scheme in the industry.

21,087. Let us see if the scheme you now propose, which I gather is to be found in Lord Gainford's evidence, is likely to secure what this Commission and the country is anxious to secure: that is, continuous production with a minimum amount of industrial strife. At present, or up to now, the wages of the miners have been regulated by prices?—Yes, by selling prices.

21,088. How do you propose that the margin of profit, which in future will determine wages other than the base wage as I understand, shall be ascertained in South Wales—I ought not to put it, "in South Wales," because I believe you are giving

22 May, 1919.]

MR. HUGH BRAMWELL.

[Continued.]

evidence for the whole country?—Yes; but I think you will find, when it comes to details, each district will almost have to apply its own views to the position. Our scheme, if you will notice, is a district scheme.

21,089. If it is a district scheme, I can with some amount of confidence approach the position as I see it developing in South Wales. Assuming that the workmen accepted that principle—?—Do you mean of profit sharing?

21,090. Yes, of profit sharing—what do you think would be the first great industrial struggle in South Wales?—Do you mean on this point?

21,091. Yes?—We should have to settle the base wages.

21,092. That would involve a good deal of friction between you and the men, but that would very largely determine the rate of profit?—Yes. We have done it in the past in the times of the Sliding Scale and the Conciliation Boards, and we hope to do it in the future.

21,093. Without struggles?—No, we have had struggles.

21,094. And without strife?—No, but we have done it.

21,095. In order to establish standards, in 1898 you had the greatest strike in the history of South Wales? I do not know.

21,096. In order to establish newer standards in 1911 under the Minimum Wage Act, you had a strike involving the whole country?—Yes.

21,097. And in 1915?—We have tried to meet that in this proposal. We suggest discussing the proposals and attempting to settle in each district with the conciliation boards, but we say that the miners' base wage should have some relation to the base wage in other industries, and suggest that it should be subject to approval or settlement by the Industrial Council.

21,098. Let us look at the broad facts and look at the characteristics of the miners, as you and I have learned to understand them. I was just saying that whenever there has been a question of fixing a standard wage in the past, there have inevitably been strikes?—There always will be the risk or at least I think so. It all depends upon the reasonableness of the parties.

21,099. That is so. One of the principal things in determining the new factor of wage under your profit-sharing scheme would be the balance which would be left as a profit balance?—Just the same as any other profit-sharing scheme in any other industry.

21,100. I do not suppose that you would argue that the scheme you would propose for the mining industry has ever been brought into being in anything like the same degree in any other industry?—That is the difficulty in the mining industry. It is comparatively easy to establish a profit-sharing scheme in a factory where they are making soap, for instance, but when we get to a complicated industry like mining, where labour forms 75 per cent. of the cost, it is the most difficult form of profit-sharing you can imagine.

21,101. That is why I am anxious to know whether you have thought out the whole of the possibilities of it?—We know there are difficulties and we are prepared to try and meet them with the men.

21,102. And if you ever hope to meet them, I suppose you would agree you would have to adopt a different attitude to what you have adopted hitherto?—I do not think we have been unreasonable, and I do not think the attitude we have adopted can be very much criticised.

21,103. After you have got over your first difficulty which, in my judgment, will involve industrial strife—that is the difficulty of fixing the new standard rates—do you not think that the next difficulty will be as to the amount of the balance that will go to the shareholder and the amount that will go to the workman?—Just let us consider that first point further for a moment. If we are unable to settle in the district, would it not be possible to put up somebody who would settle for us?

21,104. Yes, it would be possible?—I do not think we would object to that.

21,105. I am sure you would not. As a matter of fact you have always in the past, when you have failed to settle yourselves, referred the workmen to an independent chairman?—When an independent chairman existed.

21,106. Yes, when an independent chairman existed, which has been for the most part in the history of the South Wales Conciliation Boards. That is just what I am coming to. The workmen have arrived at a stage where they are not prepared, I believe, to submit their questions that they fail to settle with their employers to an independent chairman. That being the case, how do you hope that your scheme will avoid industrial strife?—That means, you are not prepared to go into any Court on the matter. You can settle nothing if you do not agree to that.

21,107. I would not like to say that the miners, so far as I can gather, will not be prepared to go into any Court, but let us look at realities. These self-same miners have got the idea that there is no independent Court or impartial Court in existence in this country to whom they could put, with trust, their problems?—Then I should think their case is hopeless.

21,108. Would you not rather suggest your case is hopeless?—No, we are prepared to go into any proper Court.

21,109. In thinking out this scheme, has it occurred to you that you might have a workman as the independent chairman?—Possibly. I have not thought of that. I presume he would be an independent person.

21,110. Would you willingly permit the question to go to him?—I do not think it would be fair.

21,111. Why not?—I think it would be equally unfair to have a coalowner.

21,112. Or put it this way. Would it be unfair to put a workman merely because he has got some special interest in workmen?—I do not quite follow.

21,113. Would it be unfair to put a workman, because he is biased in favour of workmen?—I do not think a biased person is a proper person to sit in a Court.

21,114. Can you find a person in this system of society of ours who could be described as being perfectly unbiased?—Not perfectly.

21,115. Now that is the first point. Let us come to the question of profits. If the workmen accepted the principle of your scheme they would be inspired with the same motive, would they not, as the shareholder?—That is what we want. We want the workmen to be interested in their work, and to have an interest in it.

21,116. Pardon me! That rather presumes the shareholder is interested in the work. I thought you said he was only interested in getting profit?—I think that is his interest. It is the return on his money.

21,117. If the workman accepts the principle, then I gather that, from the nature of your scheme, he would be inspired to get the greatest amount of profit?—He would be a profit-sharer.

21,118. And the determination of his share would depend upon what?—His exertion and our exertion.

21,119. What kind of exertion do you mean—administrative exertion?—Every sort.

21,120. It would not be the exertion displayed in a shareholders' meeting, you think?—Possibly not, but they do a good deal to direct us.

21,121. I should have thought that the exertion for the division of the profits would be found in the Trade Union meetings on the one side, and the shareholders' meetings on the other side?—I think the man who puts the money he has saved into a business has a right to have a return on it.

21,122. I am assuming that the principle is accepted by the workman?—If he chooses to appoint someone to look after his interests I think he is doing the proper thing.

21,123. Yes. But let me keep to the point I have in mind. I want to try to avoid the industrial unrest which everyone says is going to condemn this country

22 May, 1919.]

MR. HUGH BRAMWELL.

[Continued.]

finally, and absolutely. I want to come to the point where the workmen and the shareholders have got a certain balance of profit to share. I want to ascertain what will be the determining factor in giving to each his proper share?—Well, that I think will require a great deal of discussion and consideration.

21,124. Yes, but if you have not discussed and considered that, do you think you are entitled to put forward this scheme?—Yes, I think we are entitled to put forward a profit-sharing scheme on general lines.

21,125. Without relation to all its consequences?—Without going into details which I think ought to be settled afterwards.

21,126. If I may repeat with great respect, the question put by Sir Allan Smith yesterday, you expect this Commission then to come to a conclusion upon a scheme which you yourself have not thought out to the last letter?—No scheme can be put before this Commission thought out to the last letter, because it is impossible.

21,127. I put it to you that it has been very imperfectly thought out so far as you have gone?—I do not think so in principle.

21,128. Have you taken into cognisance those two possibilities—the possibility of the first fight for the standard wage, and the second fight for the division of the profits?—Yes, we are prepared to discuss them and try and settle them.

21,129. Locally?—Yes, locally.

21,130. Now let us turn to the question of the struggle that will be likely to develop as to the control in the industry. I put it to you that as a man of great experience in South Wales, it is not an unknown thing for the workmen to ask for some form of control in industry?—Do you mean in the management of the mine?

21,131. No; I will not put it in the actual management of the mine, but some effective control in developing the industry?—Well, I think we require to know what they want before we can answer the question.

21,132. You may require to, but Lord Gainford apparently did not stop to state that he required that information, because he says this: "I am authorised to say, on behalf of the Mining Association, that if owners are not to be left complete executive control, they will decline to accept the responsibility of carrying on the industry, and though they regard nationalisation as disastrous to the country, they feel they would, in such event, be driven to the only alternative—nationalisation on fair terms."—Yes. And at the same time he puts forward proposals as to workmen's Committees advisory to owners.

21,133. Purely consultative?—Yes.

21,134. Does that give the workmen any increased status in the industry?—You cannot do it.

21,135. Then if the workmen demand increased status in the industry and it cannot be done, this country will probably never evolve out of its present disturbed condition?—The workmen can do it if they like. They can purchase mines and work them themselves.

21,136. That is a proposition which has been put forward over and over again by way of reply to this proposition?—Well, why should they require to manage the profit part of a concern if they have no money in it?

21,137. You put that question to me, and my answer is, because they form the majority of the producers?—They get paid for that. They get a share in the profits which we pay them.

21,138. We are anxious to have industrial peace. Do you think industrial peace can be secured in this country if you, as an owner, can sit opposite me at a table when I am a workman, you occupying the position of the buyer of my labour, and I occupying the position of the seller of my labour? Do you think as long as that relationship lasts, that you can have industrial peace?—I think you are on the top side now.

21,139. As sellers?—No, as workman.

21,140. If you did not care to buy our commodity it would be wasted?—I do not quite follow your question.

21,141. I put it again, because I am very anxious to understand the drift of your mind. I am trying to get at what I believe to be the bottom of this question. The workmen say they want control. Let us leave out how they think and what they think of control for the moment. They make an application in a general way saying: "We want some form of control"—not entire control. It seems to be an aspiration with them. You say, "You shall have no effective control." If that is your relation towards the men, how can you have industrial peace?—As I said before, it depends upon whether the workmen want entire control or how much control they want to share.

21,142. Yes, whether they want entire control or what amount. But suppose the workman wants control in proportion to his numbers?—That is humbug.

21,143. What?—Humbug. Numbers ought not to count in such a matter.

21,144. What ought to count?—I cannot tell you, but it is not the number of men.

21,145. It is rather strange you should describe a numerical majority as humbug?—In such a matter as that, yes.

21,146. If you have nothing better to suggest?—I have nothing better to suggest.

21,147. I put it to you, the determination of your policy in your shareholders' meeting is determined by humbug?—Possibly. I do not agree with you, but you may say so.

21,148. I am going to quote one or two things with reference to control. Why are you opposed to control?—Because I do not think the industry can be properly carried on under joint control.

21,149. Why is that?—Did you ever know joint control do anything good?

21,150. Yes?—I did not.

21,151. I will give you a case in point. I do not think you can consider the Co-operative Societies an absolute failure, can you?—No, it is a Co-operative Society, certainly.

21,152. Is there not some form of joint control in a Co-operative Society?—They appoint their directors and managers.

21,153. Are not the members entitled to attend the meetings of the Society and very largely determine the policy, leaving the manager to carry out the policy which has been determined upon?—Just like a shareholder in a company.

21,154. I am speaking of the quarterly meeting at which the members attend?—We have shareholders' meetings annually and not quarterly.

21,155. But your shareholders are not actually engaged in the industry?—Neither are these men. They buy the stuff at the stores.

21,156. Exactly, they buy the stuff at the stores but it is their undertaking, you see?—So is it the shareholders'.

21,157. No, there are other people engaged in it. Your shareholders are in an entirely different position?—Why?

21,158. Your shareholders simply provide money capital. That is what I understand you say their function is?—That is what the Co-operative Society does with its collieries.

21,159. I am only illustrating to you that a business can be carried on successfully even with the limited form of control which you get in a Co-operative Society?—What I say is, the Co-operative Society is the same as the limited company with its shareholders.

21,160. Not in the slightest degree?—Very nearly.

21,161. That is a slight modification?—Well, it is pretty nearly.

21,162. Now, when you come to the point, you have already some form of control, have you not, on the part of the workman?—Under the Act.

21,163. A workmen's inspector can be appointed and he can be the most critical person in the colliery when he is down?—Under the limitations of the Act yes.

21,164. And have you not known that such an inspector has made useful suggestions which have been adopted by the manager from time to time in the working out of that colliery?—I should think very likely, and we are very glad of it.

22 May, 1919.]

MR. HUGH BRAMWELL.

[Continued.]

21,165. You are glad of it?—Certainly of his advice.

21,166. Has he not in a way exercised some amount of control?—That is exactly what we are offering.

21,167. Let us see what you are offering. Are you offering anything different from what was the method of the Joint Pit Committees scheme?—No, not much, if anything.

21,168. Have you heard it said even by the Miners' Federation or by any members of this Commission that when the suggestion of control was put forward that it means the manager will have less freedom to manage the mine than he has now?—If the Committee is to sit on appeal from his decision then I think the Committee is no good, and it will never work.

21,169. You do not agree with the suggestion put forward in the Report by the Chairman and the other gentlemen who signed it that the workmen are entitled to some form of control?—Some form of advisory control.

21,170. I am in agreement with you when you suggest that the manager should have an absolute right to carry out decisions when that right applies to safety; but at the present moment he exercises much more complete right than that, does he not?—Yes.

21,171. At the present moment he can dismiss a man summarily?—Yes; if he has proper justification for so doing.

21,172. Whether he has justification or not, he has power to dismiss a man?—Legally, yes.

21,173. Have not many of the strikes in South Wales been due to the fact that men have been dismissed summarily without any appeal?—I mention that. I say there may have been some cases of injustice.

21,174. If there was a committee set up upon which the workmen had some form of control, would it not be a fit and proper body to determine whether such a man should be dismissed?—I do not think so.

21,175. You do not think so?—No, certainly not.

21,176. Then a right must be reserved to the manager for ever?—As a legal right.

21,177. And you would not consider the proposition that workmen on the committee should judge the merits of the case?—No; let the Law Courts do that.

21,178. Mr. Bramwell, in that sentence you have summed up the history of the South Wales owners for the last ten years?—I do not think so.

21,179. Let the Law Courts do that?—I do not think I have summed it up.

21,180. And you have always allowed the Law Courts to do it, I believe?—No, look here. At the Disputes Committee, which we have had sitting at Cardiff since April last, we have dealt with 700 odd disputes. No Law Courts there.

21,181. I am glad you mention that. That brings me to a point I propose putting to you. I would like the committee to understand the psychology of the people in our country. When the Disputes Committee was set up, I think I had some little share in drafting its constitution, which had for its object the settling at Cardiff of all the disputes that could not be settled at home. Do you remember the first result of showing that committee up?—In what way?

21,182. In the number of disputes that came to Cardiff?—Yes; we had rather a number.

21,183. Why was that, do you think?—I should think they probably accumulated and it was a new thing.

21,184. I put it to you, that was due to the fact as the workmen had no effective means of settling these disputes at the collieries the manager felt he was relieved of any responsibility, and any dispute he might have settled he sent on to Cardiff to be settled?—I do not think that was so. I think the mere fact of setting up that Committee, which was sitting regularly every week, tended to make the men raise questions they would not otherwise have bothered to do.

21,185. That may be your view. I think when you remember that you had more disputes in the first 2 or 3 months of the history of that Committee than you had had in 6 or 12 months before it indicated that the centralisation machinery for settling disputes created disputes and not lessened them?—I think that was the tendency at first.

21,186. I also had the privilege of drafting a scheme for the establishment of Joint Committees in South Wales, to which I referred when you were in the box last, and I remember very distinctly the scheme coming before you, and you rejected it. You agreed to several clauses. When it came to this clause you rejected it?—Yes; we went to the Coal Controller about that.

21,187. Here the workmen made certain propositions to you which they thought would be really helpful?—Yes; they interfered with the management.

21,188. I will read them: * "The Committee shall receive reports from the Management and Workmen on matters affecting output, such as—

(a) Shortage of trams and road materials.

(b) Shortage of, or unsuitable, timber.

(c) Bad haulage roads and inadequate haulage.

(d) And any other causes which in their opinion is likely to interfere with the smooth working of the mine or interfere with the production of the largest output.

You rejected this scheme because it contained that clause?—That was, I think, one clause we objected to. We went to the Coal Controller with you about it. The Coal Controller offered us the scheme which was accepted by the bulk of the other coalfields. It was you who rejected that.

21,189. Certainly. I remember it and I confess it, because the Coal Controller's scheme was felt by the South Wales Miners that it did not give them—?—Because it did not give them power to interfere with the management.

21,190. That is so. Not to interfere with the manager in his work, but it did not give them power to make suggestions as to how the work should be carried on successfully?—It was not a question of suggestions.

21,191. Do you still adopt the same attitude towards it?—With our system we have Workmen's Committees of advisory capacity.

21,192. Would you agree to clause (d) of that proposition and in every cause which, in their opinion, is likely to interfere with the smooth working of the mine or interfere with the largest output?—That is rather wide; it is rather dangerous.

Mr. Evan Williams: May I hand the Chairman a copy of the final suggestions which you accepted. And was accepted by all districts?

Mr. Herbert Smith: You do not say all districts; we did not accept it.

Mr. Evan Williams: I was speaking of South Wales.

21,193. Mr. Frank Hodges: I notice, too, as an indication that your scheme is not likely to be successful, there is a great agitation springing up in South Wales against what has already been done by this Commission amongst the capital owners in South Wales. Have you noticed any such indication?—There are certain dissentient owners in South Wales who write to the papers.

21,194. Who write to the papers?—I think so.

21,195. There are others whose remarks are reported in the papers, I take it?—Possibly.

21,196. Of course, you are anxious to approach the future in a spirit calculated to be of advantage to the country, are you not?—Certainly.

21,197. You know of a colliery company called the Consolidated Cambrian, Limited?—A combine?

21,198. Are you a shareholder in that?—No, it is a combine of several colliery companies.

21,199. They have 3,000 shareholders in it, according to the report of their Chairman, Mr. Mitchell-Innes, K.C.?—That is a combined company, and each of the individual companies have also a large number of shareholders.

21,200. They have begun to complain?—What about?

21,201. About the decision of this Commission so far?—Quite likely.

21,202. They propose to resist the decision of this Commission becoming law because they have passed this resolution at their meeting held yesterday, which I will read. There is a full column report of

* See Appendix 68.

22 May, 1919.]

Mr. HUGH BRAMWELL.

[Continued.]

a special meeting of the shareholders of the Consolidated Cambrian, Ltd., held at the Engineers' Institute, Cardiff, yesterday. Mr. C. A. Mitchell-Innes, K.C., was in the chair to pass this agenda: "To take into consideration the proposed arrangements to carry out the Sankey award, these arrangements being, in the opinion of the Directors, the virtual confiscation of 40 per cent. of the profits of the Company." Here is the resolution which was carried at the end of this meeting of the shareholders in the Consolidated Cambrian, Ltd.: "That this meeting of shareholders in Consolidated Cambrian, Ltd., emphatically protest against the proposals of the Government to penalise the coal trade as compared with industries in the country, and urges that no legislation shall be introduced embodying the financial proposals based on Mr. Justice Sankey's report, which must have a prejudicial and destructive effect on the interests of one of the primary interests in this country, and that a copy of this resolution be sent to various people, including the Prime Minister and Mr. Bonar Law." I put to you that is characteristic of the coalowners in South Wales?—I think it is natural that the whole of the coalowners of the country should feel very aggrieved and sore that their industry should be separated out from every other industry in the Finance Act and made different to other industries. The pre-war standard is to be altered.

21,203. The Finance Act is not referred to in that resolution?—We know what it means, or we try to.

21,204. I am glad you are cognisant of it. The position is this. At the start of your proposal for a change in the system of working the industry, or the earning of wages in the industry, because that is what it amounts to I believe, you are creating a situation of antagonism towards the Commission and towards the miners in the hope that that antagonism might result in your escaping the obligations imposed upon you by this Commission?—Our scheme is intended as an amicable arrangement for the conditions after the effects of the war are over. What these people are objecting to is the change in the Finance Act which was a war measure and will be operating for a year or two probably.

21,205. I put to you the same spirit that has animated the coal industry and led to this crisis that has existed for 10 or 15 years is being resuscitated at the very moment when you propose to launch a scheme in some hope to get the co-operation of the men?—I think it is very natural for men to object to the extension of the Finance Act in this particular industry. We are thinking of what is to happen after that.

21,206. In conclusion let me put this to you, only because of an anxiety to try and find the best solution to this problem. Have you taken into consideration when proposing this scheme the steady diminishing output of the coal industry?—In what way, let me see how it affects it.

21,207. It is on record the output of coal per man employed is diminishing?—Yes.

21,208. In preparing this scheme did you hope that the output per man would be increased?—Yes.

21,209. You did?—Yes, I certainly believe if the men share in the profits the output will increase.

21,210. That is your belief?—Yes.

21,211. Supposing I put this to you. If the workmen held a point of view—I am not saying they do and they may not hold it to the extent which is popularly supposed—suppose the workmen held this point of view that whether under profit sharing or under the present system every increased effort of theirs means increased profit for people who do not work. Can you hope to have any increased output in the future under any scheme?—None are so foolish as to believe that.

21,212. If they are so foolish?—I cannot help their foolishness.

21,213. You cannot, although you would be responsible for it?—Yes.

21,214. *Mr. Evan Williams:* To make it quite clear. The scheme that was proposed by the Mining Association was a scheme to come into operation when the trade is given its freedom?—That is the idea of it.

21,215. It is a scheme that is impossible to superimpose on control of the kind that is in existence now, or that is proposed under the new financial arrangement?—I do not think any scheme could be got to work at the moment.

21,216. What has been suggested is a method of carrying on the industry after the war conditions are over?—That was the idea of the whole thing.

21,217. And there is the same liberty in the coal trade as in any other trade?—That is so.

21,218. You will agree, I think, that no industry can be carried on unless it maintains proper wages for the men and a fair return upon the capital?—It is bound to be so.

21,219. And unless the cost of production is kept within the price obtained for the article your industry cannot go?—No.

21,220. The whole question now, and I take it from the beginning of industry, between capital and labour is as to division of the profits of the industry between those two?—What they can get at the time.

21,221. Strictly speaking it is not right to call profit-sharing a new development or a new proposal in connection with this industry or any other?—Even the method of settling wages or regulating wages by the selling price is more or less a profit-sharing scheme.

21,222. The payment of wages and a payment for a return of capital is a sharing of the profits of the industry and always has been?—The old arrangement was an indirect profit-sharing scheme.

21,223. What the Mining Association now propose is a better method and a fairer method to both sides?—It is better in this way. It encourages the men to produce whereas the old scheme encourages him to hang back.

21,224. Take South Wales as an instance. At one time wages in South Wales were regulated by a sliding scale?—Yes.

21,225. And at that time nothing entered into the calculation or was taken into consideration for the settlement of wages except the actual price of coal?—The actual price of large coal f.o.h.

21,226. And the wages moved up and down in a certain predetermined arithmetical proportion?—A fixed scale.

21,227. The workmen in South Wales objected to that?—Yes.

21,228. And they brought forward another scheme?—Yes.

21,229. When the Conciliation Board was instituted that fixed relation between selling price and wages was put an end to?—The fixed scale was put an end to.

21,230. There was introduced a new system in which other things than the price might be taken into consideration?—Other factors.

21,231. There were in all the Conciliation Board arrangements up to the last one certain fixed points where there was a definite arrangement between capital and labour?—There has to be what is called an equivalent wage for an equivalent selling price.

21,232. As a starting price for all the calculations that have to be made?—You must start somewhere.

21,233. Each side had the right to bring in other factors for the consideration of each other?—Yes, when the Conciliation Board was formed.

21,234. Do you know the last Conciliation Board agreement, in the early part of it, costs were rising rapidly?—Yes.

21,235. And prices were rising?—Yes.

21,236. Did the owners object to the selling price being the only consideration or being the main consideration?—Yes, because cost of production had risen so enormously.

21,237. They put it in this way. If the price of coal goes up a shilling and the wages of the workmen go up a shilling there is no greater ability to pay the increased wage?—None.

21,238. When those arrangements were put to the workmen and the owners produced the statement of cost, what was the reply of the workmen with regard to that?—I do not remember what they replied. The first Conciliation Board did fix an equivalent.

22 May, 1919.]

MR. HUGH BRAMWELL.

[Continued.]

- 21,239. I am speaking of the last one?—In the last one they refused to have any equivalent. That was only the last Conciliation Board Agreement.
- 21,240. The owners did produce an audit of costs which had been made out by themselves or their auditors?—Yes, we employed accountants to get them out.
- 21,241. Did the workmen absolutely refuse to take costs into consideration?—I think they did—I think so; I cannot remember quite.
- 21,242. Was not this their position? They said those costs have been taken out by you; we do not know how they have been taken out, or from what colliery; we are not parties and therefore cannot entertain any arrangement based upon them?—I think that was their attitude.
- 21,243. Did they not then want a basis for the ascertainment of cost to be settled?—I believe it was proposed to have a joint audit of cost.
- 21,244. And a determination of the items that formed part of the costs?—I presume so.
- 21,245. Is it not the fact that where the wages are governed by selling price terms there is a direct inducement to the worker to increase the cost of production?—If the cost of production increases for the whole district, undoubtedly eventually, or in a little time the price must rise; therefore the men would claim increased wages, and so on.
- 21,246. Because the cost has gone up?—Because the cost has gone up.
- 21,247. And the endeavour of this scheme was to make it as much to the interest of the men to reduce cost as to get an increased price?—That was our object.
- 21,248. So he obtains as much by a reduction of a shilling a ton in production as an increase of a shilling a ton in the selling price?—Yes.
- 21,249. That is the underlying scheme for the regulation of the mines?—That was the idea.
- 21,250. To go into more detail. The proposal was this, that there should be an ascertainment first of all of a wage for the colliers?—Fixed as a distinct minimum as under the Conciliation Board. Our present Conciliation Board Agreement has a minimum of 10 per cent. That 10 per cent. is paid on a fair standard wage at every colliery in the whole county, and the object of this thing was to propose a minimum standard, such as the 10 per cent. in our Conciliation Board Agreement. At present we are paying 55 per cent. on our Conciliation Board prices.
- 21,251. There is no suggestion that the present quoting price dead work rate day work rates should be wiped away?—No, every colliery has dozens of standard prices at each colliery and they vary very much.
- 21,252. The idea they favour is a basis with a certain percentage added to them?—The minimum percentage of the district.
- 21,253. There are other costs besides labour?—Yes.
- 21,254. Which are ascertained by audit?—Yes.
- 21,255. In the first place, the cost of labour at every colliery is ascertained by an examination of the books and that audit can be made, and is proposed to be made, by accountants appointed by one side or the other?—Yes, by both sides.
- 21,256. It is the intention that the items which can legitimately be regarded as working costs shall be returned and agreed upon by both sides?—I take it in this way. When it comes to discuss the cost of production of items we have discussions at Cardiff about it with the other side, and we agree on the large bulk of items to be included. There may be one or two things to be left to the joint accountants at the office.
- 21,257. If it could not be settled by both sides, it might be referred to a third party?—Yes. The principal thing would be the difficulty of sometimes saying whether a certain operation should be charged against capital or revenue. There are some on the border line.
- 21,258. In that way you do all that is necessary for an ascertainment of the basis of the working costs?—I think it can be done, and the very fact that Durham has practically done it shews it can be done.
- 21,259. Mr. Herbert Smith: Durham denies it?—That is what I am advised, and, subject to correction, that is what I say.
- 21,260. Mr. Evan Williams: Whether Durham has done it or not, there is no inherent difficulty in getting it done?—I think it is quite possible.
- 21,261. There are other costs, timber, stores, and that kind of thing, which can be ascertained in the same way?—That is what I am referring to.
- 21,262. Any dispute as to the items to be properly taken in, as for other costs, can be decided in the same way?—Yes.
- 21,263. You have the basis wages cost and the stores cost. The next item is a minimum return on capital?—Yes.
- 21,264. A return in the way of interest?—Yes. That would be a county arrangement—a district arrangement.
- 21,265. Having ascertained the cost per ton of basis wages and cost per ton for stores, the next thing is to ascertain the amount per ton to be set against the minimum award applicable?—For interest and depreciation.
- 21,266. To do that strictly and correctly, I suppose the valuation of the colliery would have to be made?—Practically, it would. I do not see how you can ascertain the true capital in a colliery company without really making a valuation.
- 21,267. Is it possible without going into such detail to fix between two sides such an amount as would be considered fairly to represent the increase?—It might be possible. I do not say it would not be possible. You mean the amount of capital?
- 21,268. On which a certain rate is taken?—It could be done generally in a way. It would have to be subject to exceptions.
- 21,269. You could, as Lord Gainford suggested, agree a rate per ton that would be applicable over the district?—It is possible we might come to an arrangement of that sort.
- 21,270. That amount per ton multiplied by the output of the district would give you the total estimated capital roughly?—Yes.
- 21,271. In case of disputes between the two sides that again might be referred to be decided?—Yes.
- 21,272. The next point is the amount of the return?—Yes.
- 21,273. And the amount that is fair to set up against the depreciation?—Yes. That part would have to be interest on the capital. It would have to be depreciation on the concern and some amount for future development. It must all go into it.
- 21,274. All that could be expressed by a certain amount per ton of output?—It could.
- 21,275. I do not know if you have considered how small a difference it really makes to the wages per man if there is a difference, say, of £5,000,000 in the capital estimation?—I cannot say that I have.
- 21,276. I have worked it out and I make it about 1s. a week?—£5,000,000 to the capital is worth 1s. per week a man.
- 21,277. A difference of £5,000,000 in the total estimated capital one way or the other would only make a difference one way or the other of 1s. in the wages of the men?—That shows how little important it is.
- 21,278. It might be without going into elaborate calculations to equal it between the two sides upon a certain amount per ton, say, 1s. 6d., 1s. 8d., or 2s., which might be set against the capital sum?—It seems to me rather easier than I thought.
- 21,279. You then have three things which are practically irredeemable: basis wages, stores cost and other costs, and capital?—Yes.
- 21,280. You can make an ascertainment of the selling price of the coal in the whole district?—That is ascertained now.
- 21,281. In that way you can find what is the balance remaining after those first charges have been made out of the total selling price of the coal?—There is a balance.
- 21,282. That balance is the amount that is distributable again to capital and labour?—Yes, that is where the profit-sharing comes in.

22 May, 1919.]

MR. HUGH BRAMWELL.

[Continued.]

21,283. When you speak of profit-sharing it is the division of that surplus between the two?—That is so.

21,284. Then there is another question which comes in of the proportion in which that division has to be made?—Yes.

21,285. Whether it is 50 per cent. to labour, or two-thirds to labour, or three-fourths to labour, or whatever it may be?—Yes.

21,286. That again can be settled in the same way?—Yes; of course there will be a lot of inquiry to be made before we can arrive at a settlement. I do not know why it is impossible; it is done in other industries.

21,287. Does that process seem to be more difficult of settlement than the settlement we have had to make in Conciliation Board agreements?—It is of a similar nature.

21,288. In the past we have succeeded?—In some way or other.

21,289. How many Conciliation Board settlements have been attendant on strikes in South Wales?—I do not remember that there has been a large number. There have been three or four sliding scales, and I think three or four Conciliation Board agreements.

21,290. Since the big strike of 1893 there have been several Conciliation Board agreements?—Several.

21,291. In no case when the matter has been left to the owners and men has there been a strike over the Conciliation Board agreement?—The only one I remember is the one Mr. Hodges mentioned.

21,292. There the Government intervened?—Yes.

21,293. And the strike was owing to the refusal of the men to accept the Government terms?—I cannot remember that.

Mr. Frank Hodges: I should like to have it on record when it is said that the strike was against the Government and not against the coalowners, that is untrue.

21,294. *Mr. Evan Williams:* The strike was the consequence of the workmen's refusal to accept the terms the Government proposed?—I cannot say for certain that is so, I will take it it was so, but I cannot remember.

21,295. Did not the owners place themselves unreservedly in the hands of the Government?—I think we did in Mr. Runciman's hands in those days.

21,296. The men refused to accept it?—Yes.

21,297. That is an outline of the scheme we proposed?—Yes.

21,298. There are so many things to be settled between the two sides that it is impossible to fill in all the details?—Yes, it is most difficult and requires a lot of negotiation before it can be done.

21,299. Would it be merely a statement of the details when filled in?—If the scheme was put forward filled in with details you would not get it accepted at all.

21,300. That scheme does provide an incentive to the men to decrease the cost of working?—Yes.

21,301. Increased production per man?—Yes.

21,302. And for every increase in production the man benefits on his piece-work rates?—Yes.

21,303. It is to the interest of every man to see that there is as much agreement in working as possible?—Yes, with the object of profit sharing.

21,304. Do not you think when that is fully realised by the men throughout the coalfield, and when there has been a settlement of all the points we have been discussing, is there bound to be a better feeling of co-operation in the industry?—I think there would be.

21,305. The next point upon which the proposals are made is co-operation between workmen and owners. I think you made it quite clear the one thing that neither owner nor manager nor agent will have is interference with the manager upon the points for which he himself is solely and personally responsible?—Yes.

21,306. There is no objection to discussing other matters with the men?—No.

21,307. There is no objection to giving all the information as to what is proposed to be done at the colliery?—I do not see any objection.

21,308. Provided the executive authority of the manager is not weakened at all?—The manager must decide if he is to be responsible.

21,309. On questions of safety in particular?—And also the economic development of the mine.

21,310. And the question of discipline?—Yes.

21,311. And the question of the technical management?—Yes.

21,312. Which I think we had from the Home Office reports are inseparable from him?—Yes, I think they said so.

21,313. There was no question asked about the dismissal of men? Is it not your experience that men are dismissed without adequate cause?—No, by no means.

21,314. Is there not an ever ready remedy which the men have and apply if they think there has been any?—If the men think the thing is serious they will very soon stop it.

21,315. At the present moment are there not representations made to the manager by the pit committee on questions of that kind?—I should think there are.

21,316. Have you in your experience with regard to your managers that they have had deputations from men who have been dismissed?—Yes, I think we have. We had a surface man who got his notice some time this year and on representation from the Engine Men's Association we agreed to withdraw his notice.

21,317. I put it that there is a very substantial measure of joint control at the present time in the industry?—Yes.

21,318. There was equality between the two sides?—Yes.

21,319. Take wages?—Yes.

21,320. And in the determination of prices?—Yes.

21,321. And many other things?—Yes.

21,322. There is absolute equality between the two sides?—One might say there was almost a preponderating power in the men?—Latterly, yes.

21,323. In matters of that kind where it is possible to have joint control there is no objection?—We have never raised any.

21,324. Matters of wages and things that can be the subject of discussion?—None.

21,325. And full discussion of many other matters is possible with the Pit Committee?—I think so.

21,326. What more do you suggest can be given without injuring the interests of the men?—It all comes to the question of the responsible person and the responsible person must be the person to decide.

21,327. There are one or two things outside your proof. There has been a great deal said on this Commission as to the functions of directors and what use they are. You are a director, and you are a colliery agent, and you have been a colliery manager. Give the Commission an outline of the extent to which, in your experience, directors interfere with the management?—First of all, directors have a certain statutory obligation under the Companies Limitation Act. They have to appoint their agents and managers very often. Sometimes the agent will appoint a manager in consultation with the directors; then they have to meet regularly to examine all purchases, invoices, sign cheques and everything of that sort. Then their duty is also to have a policy as to the development of the mine because it is a wasting asset. On that they are advised by the agents or managers, but they have to decide their policy as to what is to be done. Nearly every company that I know of will probably have a definite policy it may have been following for 20 or 25 years gradually coming up to it, and it is the directors who gradually define that policy. There are a number of other minor things. We are constantly taking up new agreements and leases of all sorts and description. There are 60 or 70 separate agreements of minerals, some falling in at one time, some going out, some being renewed; all kinds of cases with regard to certain breaches, and therefore damages to be settled by the directors on the recommendation very often of the mining engineer. My experience is the directors are a very important body in any

22 May, 1919.]

MR. HUGH BRAMWELL.

[Continued.]

colliery concern, especially in our complicated ones like these are in South Wales.

21,328. The cost of the administration of the Board of Directors is very, very low?—Comparatively low. Our directors meet fortnightly, and it takes them about three hours to get through their routine work every fortnight.

21,329. *Mr. Herbert Smith*: What is the salary?—£400 a year each.

21,330. *Sir Leo Chiozza Money*: How many?—Four.

21,331. *Mr. Evan Williams*: Do you work out how much on your output that is increased?—About 1d. a ton.

21,332. There are some points that have been referred to at the Commission from time to time. It has been suggested the owners have interfered with the introduction of safety appliances and rules?—That is a most unjust statement. As a matter of fact, I do not know of a single safety appliance that has not been first of all proposed and introduced by the owners, not a single one, and every rule the Home Office have taken from rules in existence in the different coalfields before the Mines Act was started, and improved since. Take the safety appliances. Take the one, the sensational one, many people talk of, the automatic controller to stop the winding machine over winding at the pit top. That was introduced by colliery owners as far back as 1839. It was so imperfect and the mechanical craftsmanship of the day was so poor that it dropped out of use. It used to come into operation when not wanted and was a positive danger. It has been improved since until at a number of collieries they began to put it in, and then the Home Office thought this was perhaps a good thing, and they said, "We will make it compulsory," and they tried to bring in an Act of Parliament to make it compulsory in every single shaft in the country, whether suitable for it or not. The owners object to that on the very ground of safety, and even now these appliances are so imperfect that we are simply living in dread of their coming into action. I have an electric winding engine at the present moment; it has been running about 8 or 10 years; it is supposed to be typical of the best practice of the day; it has every safety appliance put on to it, and the men working it refuse to run it so long as the automatic control arrangement was in operation because we take our supply from a public company, and there is a possibility, which happened once or twice, of the current being cut off and the apparatus coming into operation in the middle of a wind, with desperate risks of jerking any man out of the cage and breaking the ropes. The thing is working now, but we live in dread of it acting in that way. We have to have it acting in that way, or it will not stop the cage when it comes to the top. I will give you a simile. The streets of London are just about as dangerous as a coal mine. There were 628 fatal accidents in the streets of London last year. I estimate there are about 500,000 people in the streets at any one time out of the 5,000,000 that are living in the place. That makes the risk of street accidents in London just about the same as the risk of a man working at a colliery. Some Borough Engineer makes a subway for passengers at a dangerous crossing. The Home Office says, "This is a splendid idea," and they go to Parliament and ask for a Bill to make it compulsory to put underground subways at every crossing. Local Councils say it is no use, and then they are accused of neglecting safety because it pays. That is just about a simile of all safety appliances at a colliery.

21,333. There are some safety appliances that have been attended with a far greater loss of life than they have saved?—The great thing about automatic appliances is this. They nearly always provide against one risk and incur another one, and it is a question of adding up and seeing which is the worst.

21,334. It is the universal application of things of that sort the owners object to?—They are not against safety. These statements are making the mining people of the country boil.

21,335. Similarly, I take it, a system of private ownership has a tendency to neglect safety because of the pull of profit?—I know Mr. Sidney Webb said the tendency was in that direction, but he used it as

an argument against private ownership, and that meant to say it was neglected; otherwise it was no argument.

21,336. Will you give the Commission the benefit of your view upon the suggestion as to unification? As a means of more efficient production. It has been suggested that by unification production could be cheaper or could be made more efficient?—I think the limit really comes into this, that you have a certain staff and a certain man who is the responsible person. If the place gets too big it becomes expensive and red tape. If you can keep it within the limits of one man and the man's capacity varies you get the most economic position.

21,337. You would not deny there are instances of a few small collieries in a district where there would be a clear advantage if they were worked under one management?—Nobody denies that.

21,338. Would you go so far as to suggest that in such a case there shall be compulsory powers in somebody, some council or some industrial body, to compel amalgamation in a case like that?—If it could be shown it was necessary for the interests of the industry or the State.

21,339. Either on the initiative of people themselves or some outsider, if such a body is suggested by this Commission, the council under the sanctioning authority would intervene?—It is desirable if in the interests of the State.

21,340. And give power to do it by law?—Yes.

21,341. There is one more point I should like you to give the Commission your opinion upon. Take the question of the accusation made against the industry as being inefficient generally in the machinery that is put up by the collieries. You have rather definite views upon that point, I think. Would you say that the fact that the machinery at a certain colliery was not of the best and latest type with all refinements was in itself a proof it was not the best suited for the particular case?—The point always comes in whether it is theoretical efficiency they are talking about or economy. For instance, to merely say that the colliery consumption is high is no guide to anybody. Nobody knows what it means. You have to find out what sort of coal was burnt—very often they burn refuse; how much water they pump; whether the lie of the seam is flat; and they have to see the power required at the colliery before they can arrive at an opinion as to whether the consumption is big or not. To measure it as a percentage of output is silly, except for periodical comparison. Equally, with the most efficient and best machinery possible, many pits, for the moment, have only a small output, and the cost for colliery consumption on percentage of output would be very high, whereas they might have the most efficient machinery possible. There is one other point. Some mines are bound to be fitted with theoretical efficient machinery, and others with less efficient. If you are going to imagine every mine is to be brought up to the most theoretical efficient level, it is almost absurd. It is practically the same thing as, say, every tramp steamer at sea should be equipped like the "Lusitania." As a matter of fact, any dirty little tramp steamer with its theoretical inefficient engines is a more economic unit than if it had the highest class turbine machinery in it.

21,342. With regard to the wages of the district being brought to the level of the poorest colliery in the district. Do you remember the decision under the Minimum Wages Act in 1912?—Yes.

21,343. Do you remember it was claimed on the men's side that the poor collieries on the west were paying higher rates than the richer collieries in the east?—It was not only claimed, it was proved as a fact.

21,344. In South Wales generally, the poor collieries for some reason have been forced to pay higher tonnage rates than the big rich collieries?—It was proved as a fact.

21,345. As far as the basis rates are concerned the poorer collieries are not below as far as the district percentage is concerned; they are regulated by

22 May, 1919.]

MR. HUGH BRAMWELL.

[Continued.]

the average of the whole collieries?—That is so in South Wales.

21,346. Generally speaking, the poor collieries with the higher wages being of lower output affects the general average?—It must do so.

21,347. Is there any justification for saying poorer collieries bring down the level of wages?—Certainly not in South Wales.

21,348. *Mr. Herbert Smith*: If he confines it to South Wales I do not object?—I cannot speak for other districts on that point.

21,349. *Chairman*: I have been asked to ask you two questions. You told us there is a good deal of industrial unrest in South Wales. The first question I have been asked to ask is this: What is your view on the cause of that industrial unrest?—It arises at the local workmen's lodges. The men who run the lodges at the present time happen to hold very extreme views, and I think it is the effect of their views and being practically in control of the machinery

that tends to cause the unrest at the individual collieries which eventually culminates in district unrest.

21,350. That is your view of the cause?—I think so.

21,351. The second question is what in your view is the remedy?—That is very difficult.

21,352. I did not ask you because it is an easy question; I want you to help us. Do you know a remedy?—I believe myself if the miners' agents in the district take the thing more in their own hands they could make matters a great deal better, because this unrest is very largely directed against them as well as against the owners.

21,353. Is your remedy for the present unrest the suggestion the miners' agents should get more into their own hands?—I cannot say it is that. I think the remedy is some form of profit-sharing which will give the men an interest in the concern.

Chairman: We are much obliged to you for your assistance.

(The Witness withdrew.)

MR. WALLACE THORNEYCROFT, Sworn and Examined.

21,354. *Chairman*: I will read the introduction. "Mr. Wallace Thorneycroft is a Mining Engineer and Certificated Colliery Manager of upwards of thirty years' experience; the Managing Director of the Plean Colliery Company Limited, of the Lochgelly Iron and Coal Company, the Chairman of the Steel Company of Scotland, Past President of the Institution of Mining Engineers, and Fellow of the Royal Society of Edinburgh." Mr. Thorneycroft will now read his proof:

"THE FUTURE ORGANISATION OF THE COAL INDUSTRY.

In order to consider the future organisation of the industry it seems necessary to recite the present and past methods, the conditions necessary for the successful carrying on of the coal trade, and what private enterprise has done. I propose to deal with these matters and discuss the alternative schemes put before the Commission by the miners' representatives, and finally to indicate generally what in my opinion are the changes that should be considered by the Commission.

(1) *The present system of ownership and working in the coal industry is as follows:*

By orders made under Regulation 9c D.O.R.A. all coal mines have passed into the possession of the Board of Trade, which has appointed a Controller of Coal Mines to control them, and every owner, agent, manager and every officer thereof is bound to comply with the direction of the Board of Trade as to the management and user of the mines; it is further expressly provided that possession by the Board of Trade shall not affect any liability of the actual owner, agent or manager of the mines under the Coal Mines Acts, 1887 to 1914, or any Amending Act.

By Regulation 9ggg, the Board of Trade may authorise any person to take possession of any seam of coal (for the time being unworked) and get the coal, but shall not authorise the opening of any new surface works, and in determining the compensation to be paid for any coal gotten regard should be had to the royalties current in the same mining district for the same class of coal.

These regulations control all matters relating to production of coal, and are made more or less workable by the Coal Control Agreement which is scheduled to the Confirmation Act.

The Coal Controller is solely responsible for the present conduct of the industry and its results.

One important effect of the Coal Control Agreement must be noted. The actual owner's power to lock out miners is given up while the miners' right to strike remains.

The selling price and distribution of coal for home consumption is regulated by Coal Prices Limitation Act, 1915, and sundry Orders.

Coal Pit Mouth Prices Orders.

Coal Transport Order, 1917.

Wholesale Coal Prices Order, 1917.

Retail Coal Prices Order, 1917.

Local Authorities (Retail Coal Prices) Orders

The regulations controlling price and quantity of coal to consumers are very complicated. They fix the margin retainable by those handling the coal from truck to coal cellar and also by merchants through whose hands large quantities pass both for home trade and export.

The costs of distribution are extravagant, but as a rule the distribution of coal to small consumers and householders is outside the control of the coal owners.

The advantages claimed to result from the Coal Transport Orders are problematical.

The prices of export coal are fixed by the Coal Controller, while the exportation itself is regulated by a system of licences issued by the War Trade Department of the Treasury (with advice from the War Office and Foreign Office) who, under the Customs Acts, exercise the powers of prohibition of exports given by Royal Proclamation. The prices fixed for export differentiate between Allied and neutral countries, the latter being much higher than the former, and both very much higher than the fixed home prices. Admiralty coal in South Wales was commandeered and the prices were subsequently agreed.

The present system has arisen out of the war. It is entirely abnormal and artificial—it may have been a necessity on account of shortage of supply during the war, and the governing factor was output at any price. The principles adopted for working out the regulations were unsound and inequitable in operation. It should be noted, however, that in addition to the 80 per cent. of excess profits payable to the Government by all industries, the coal owners agreed to give up 15 per cent. of the excess profits out of 20 per cent. allowed if they were able to earn excess profits under control and submitted to regulations which obviously prevented a large proportion of the output earning the standard profit allowed.

The principal evidence given to the Commission during the first stage of its enquiry was wholly in reference to the present abnormal system. The coal owners were specifically instructed by the Secretary, in a letter dated 27th February, written by the direction of the Chairman, to confine their evidence as far as possible to the seven questions specified, all relating to wages and hours, and did so. The terms of that letter were as follows:—

22 May, 1919.]

MR. WALLACE THORNEYCROFT.

[Continued.]

Copy.

COAL INDUSTRY COMMISSION.

Circular Letter to District Coal Owners' and Miners' Associations.

VERY URGENT.

2, QUEEN ANNE'S GATE BUILDINGS,
WESTMINSTER, LONDON, S.W. 1.
27th February, 1919.

SIR,

I am directed by the Chairman of the Commissioners to inform you that he desires your Association to send one witness to give evidence before the Commissioners upon the first part of their enquiry, which it is intended to conclude by the 20th March. That part of the enquiry will be confined to a preliminary investigation into the questions of Wages and Hours.

The Wages claim of the Miners' Federation of Great Britain is that the workmen should receive a 30 per cent. increase on the present earnings, exclusive of the present War Wage, which would then be added to the total.

The Hours claim of the same Federation is that "six" should be substituted for "eight" in the Eight Hours Act, and that a similar reduction should be made in the hours of Surface Workers.

I should make it clear in the first instance that what you are now being asked to do is merely to provide evidence of a preliminary character, and that a further opportunity will be accorded to you in the later stages of the enquiry to supplement that evidence and to deal with matters which are not immediately germane to this part of the enquiry.

For the purpose of reducing to some common form the evidence from the various districts, I am to request that your witness should give attention to the following questionnaire and, as far as possible, confine his evidence to the points indicated therein, while feeling at liberty, should he consider it necessary, to depart from or supplement this questionnaire at any material point.

1. What in the opinion of the witness would be the probable increase in working cost per ton of conceding;

(a) a thirty per cent. increase on the present earnings of workmen exclusive of war wage;

(b) the reduction in hours above referred to. (See question 5.)

2. Would there be in his opinion any compensating factors which, if these concessions were made, would tend to diminish the working cost per ton; for instance, more regular daily attendance in consequence of shorter hours?

3. Would there be in his opinion any aggravating factors which, if these concessions were made, would tend to increase the working cost per ton, for instance, an increase in voluntary absenteeism?

4. Supposing the reduction is in hours claimed, or some less reduction, to be conceded, what consequential rearrangement of shift would in his opinion be necessitated:—

(a) as between surface workers and underground workers;

(b) as between the various classes of workers, surface or underground.

5. What further number, if any, of workers, surface or underground, would it be necessary, in his opinion, to employ if the word "six" were substituted for the word "eight" in the Eight Hours Act and a similar reduction made in the hours of surface workers?

6. *Face Workers.*—The present winding times, as approved by H.M. Mines Inspectors, are being obtained from them, and the collieries have been asked to furnish the present average time consumed in travelling from the shaft bottom to the coal face and back from the coal face to the shaft bottom.

(i) What is, in his opinion, the present average time spent at the coal face in your district.

(ii) What, in his opinion, would be the percentage reduction (if any) in output involved

by conceding the claim for the substitution of "eight" for "six" in the Eight Hours Act?

(iii) Would there be, in his opinion, any compensating factors which, if this concession were made, would tend to diminish any reduction in output—for instance, increased effort resulting from shorter hours?

(iv) What, in his opinion, would be the net reduction (if any) in output resulting from the suggested amendment in the Eight Hours Act:

(a) Assuming the present number of coal getting shifts to remain the same; or

(b) Assuming the present number of coal getting shifts to be increased in your district if possible.

(v) What is the probability in your district of an increase in the number of coal-getting shifts by mutual agreement?

7. Apart from considerations of working cost per ton and of output, what in his opinion would be the chief advantages (if any) in point of health and risk of accident, or otherwise, likely to accrue from the concession of the reduction of hours?

The Commission have been instructed by the Prime Minister to make an Interim Report upon the wages and hours claims not later than the 20th March, and therefore the taking of evidence will begin on Monday, the 3rd March. You are requested as soon as possible after the receipt of this letter, to telegraph to me the name and address of your witness, and he will receive in the course of a day or two a telegram notifying him when and where he should appear before the Commission. Meanwhile the Chairman will be obliged if you will at once put the matter in hand, and request your witness to prepare a summarised proof upon the lines of this letter.

The Chairman fully realises that it will not be possible, in the time afforded to the witness, to prepare anything in the nature of an elaborate proof, but he instructs me to say that it will greatly facilitate and expedite the taking of evidence if the witness would forward to me at the earliest possible moment a skeleton proof which could be in the hands of the Commissioners at the time he is giving his evidence.

A similar letter has been sent to the corresponding Owners' and Miners' District Association.

I am,

Sir,

Your obedient Servant,

(Signed) ARNOLD D. McNAIR.

Clause 5 of the Coal Industry Commission Act states that the Commissioners shall, as soon as practicable, make an interim report on the questions of wages and hours of work of colliery workers.

I therefore submit that it was unfortunate that any of the Commissioners should have made interim pronouncements upon the organisation of the industry when this was not the topic to be dealt with and before evidence on the subject had been fully presented.

(2) *The pre-war system of ownership and working in the Coal Industry was as follows:—*

i. The coal mines were owned originally by private individuals or co-partners. On the passing of the Limited Liability Acts these Acts were largely adopted, and gradually the majority of the mines came to be owned by limited companies. The shareholders in such companies can, and when necessary do, exercise a very real control over the directors and the general policy of the companies. They provide the capital. The number of shareholders of companies who raise coal is—

I am sorry I have not the number. We shall have the number and we will put it in as soon as we get it.*

21,355. *Sir L. Chiozza Money:* You are going to reduce it to individuals?—Yes; it takes a little time.

"There has been a tendency towards amalgamation of such companies, and the output from groups of mines in each district owned by one company has grown. So long as such amalgamations are not too

* From figures certified by Sir William Peat from Returns made by 683 owners employing 856,674 persons according to Home Office List of Mines, 1917, the net number of investors, excluding duplications, was 127,970, giving a percentage of investors to employees of 14.9.

22 May, 1919.]

MR. WALLACE THORNEYCROFT.

[Continued.]

large, economy and efficiency probably result from them, and the consumer is still protected by free competition, and if sufficient companies remain independent to secure full open competition, it may be true that certain economies result from well-designed amalgamations of private interests into fewer hands. I am opposed to monopoly, but the test of monopoly is not the size of that which is acquired, but the trade power of that which is not acquired.

ii. The mines were worked under numerous Coal Mine Regulation Acts, 1887 to 1914, which chiefly relate to safety, and it is probably fair to say that such regulations as are beneficial are those which impose upon all mines the principles adopted for safety and efficiency at the best managed mines in the country. I do not think it is true that accidents would be reduced by the removal of the profit-making motive involved by private ownership, and in my opinion the cost of carrying out the provisions of the Mines Act, 1911, and previous Acts was paid by the consumer. Good discipline below ground is required to prevent accidents.

iii. The price and distribution was regulated by free and effective competition between the various districts and between the individuals or companies owning the mines in each district or by free and effective competition between merchants both in the home and export trade, and home and export prices for each class of coal were about the same.

iv. The Minimum Wage Act, 1912, under which statutory minimum rates of wages were fixed separately for each district for all classes of underground workmen in 1912, has an important and far-reaching effect upon prices. It, in fact, prevents a fall of prices below a limit fixed by the average cost of production in that district. It stops cutting of prices below a certain point and curtails output; subject to this safeguard in respect of wages, free competition in prices is a national advantage.

v. Collective bargaining in each district settled the general rise of all wages above the statutory minimum; the bargains were made by Conciliation Boards in each district.

The machinery of conciliation in the mining industry has been gradually evolved over a long period, and may be regarded as being more or less complete in every district of the country. Conciliation Boards work well so long as they are confined to regulation of the general rise and fall of wages and general conditions of working, and so long as the spirit of conciliation is present on both sides.

vi. Detail wage questions and conditions of working are first discussed in the pit between the individual workman and official of the mine and the vast majority settled there. Those unsettled are dealt with at discussion between deputations or committees of the miners (generally acting with their union officials) and the colliery manager and his official staff, all of whom know the facts. At certain collieries under my charge regularly constituted pit committees were in operation for many years before the war, with beneficial results to both parties.

(3) *In the coal industry success or failure depends upon many factors:—*

(a) Those over which no one has any control. These may be termed geological conditions, and in this respect mining differs from most other industries. These conditions are more or less proved by the process of searching for coal after proper arrangements for the right to work any minerals found are made. Security of tenure is essential.

(b) The selection of the best method of winning and working each undeveloped area of coal and each particular seam in that area. This demands the highest technical skill, local knowledge and speculative interest.

The result of any scheme adopted is not apparent for a long time, and continuity of policy, modified

to meet the inevitable unforeseen difficulties, is absolutely necessary. The object in view is the safe and economical working of the coal, and the interests of the owners and the miners are the same.

(c) The selection of the best methods of treating each seam of coal when brought to the surface, having regard to its several qualities and the best market for each of a great variety of qualities found.

This is less difficult than winning and working. The object is to put the coal on the market in its most efficient form, and the interests of the owner and miner are identical with those of the consumer. The conveyance of the coal from the colliery to the consumer or to the port for export is usually in the hands of a public railway and in trucks, sometimes owned by the colliery owner and sometimes by the railway company. If it were an obligation on the railway company to provide the trucks on reasonable terms there would be no necessity for the colliery company to own them. As things were, however, before the war, in many districts it was necessary for the colliery owner to provide trucks to maintain continuity of output.

Certain minor difficulties in connection with the searching for, winning, working, treating and carrying away coal have to some extent hampered the industry in the past, but they have not prevented the development of coal in quantity sufficient to meet the national demands. Alteration of the law in relation to such matters was recommended more than 25 years ago, and detailed recommendations have again been worked out by the Acquisition of Land and Valuation Committee appointed by the Minister of Reconstruction, in their report dated 18th March, 1919.

Certain alleged inefficiencies have been set forth in the report of the Coal Conservation Committee.

The recommendations of that Committee, to be found on page 63, Part IV. of their report, are worthy of consideration, but in the aggregate, spread over the total output of the United Kingdom, I am satisfied that the total possible saving is of the order of one penny per ton.

So long as a consumer can take delivery of one or more truck loads at one time the intervention of a middleman is not necessary, although often convenient in the interest of both owner and consumer. If, however, the coal has to be delivered by cart in small lots, as is usually the case with household coal, the coal merchant is an essential part of the system of distribution. I hand in a statement illustrating how the price to the consumer was made up for the years 1913 and 1918 respectively."*

Chairman: While you are reading that you had better take a typical instance of household coal.

21,356. *Sir L. Chiozza Money:* Is this coal to London?—No, Scotch. I am more familiar with Scotland, and I prefer to take things I am familiar with.

21,357. *Chairman:* Take, for example, household coal. Many people are interested in that. In 1913 in Scotland the rent, royalty and wayleaves was 6d., the cost of winning and working, including wages, timber and supplies, profit and financial administrative charges came to 12s., then the transport comes to 4s.; delivered at station it was 16s. 6d. Then the distribution charge was apparently 33 per cent. Is that right?—5s. 6d. out of 22s. in 1913.

21,358. 25 per cent. I was taking 5s. 6d. in addition to the 16s. 6d. You are quite right, it is 5s. 6d. out of 22s. Therefore the distribution charges were 25s. Then we come to 1918. The rent, royalty and wayleaves were 6d., the cost of winning and working, &c., 22s. 6d., the transport 4s., and the result is 27s. delivered at the station. The distribution charges have gone up from 5s. 6d. to 13s. 10d. Is that about 150 per cent. extra?—Those are the figures given to me by a merchant.

21,359. My arithmetic may not be so good as yours. I was asking you whether the distribution charges

* See Appendix 69.

22 May, 1919.]

MR. WALLACE THORNEYCROFT.

[Continued.]

have gone up 150 per cent?—I think they have gone up rather more.

21,360. I dare say that is so?—It is more than double. Yes, it is about 150 per cent.

21,361. Am I right?—Quite so.

21,362. Whereas the charges at the pit delivered at the station have gone up about 60 per cent.?—Yes.

21,363. From 16s. 6d. to 27s. So that the cost of distribution seems to have gone up enormously?—Under control.

21,364. *Mr. Robert Smilie*: I should like to clear that up. You say the cost of distribution went up a certain percentage under control; but the cost of collection at the pit also went up?—The price at the pit is governed by the Coal Prices Limitation Act.

21,365. It was under control?—Under the control of the Coal Prices Limitation Act.

21,366. You emphasise the fact that the extraordinary percentage increase in the price of distribution was under control?—Yes, I do.

21,367. I also emphasise this, that the production price was also under control. Is that not so?—Precisely, it is under the Coal Prices Limitation Act:

“(d) The selection of a competent administrative staff. The underground staff is, in fact, always drawn from the colliery workers. Those best educated generally and technically are chosen, and work their way up to the higher positions according to their ability. The technical and commercial staff are selected from all classes of the community, but usually have been born and bred in a colliery district. The owner agent and manager must retain the executive power.

(e) The provision of sufficient capital. The present owners of coal mines are not as a rule wealthy individuals looking after their own capital, but an aggregation of thrifty persons with a taste for speculative investments.

In very many cases where the managing owners are persons looking after their own capital together with that of the savings of the thrifty, they are men who have risen from the rank of the workers themselves, or are men one generation removed. Thrift and ability, combined with education and hard work, have given them their position. It is more difficult for a man with small savings to start a colliery than formerly, but on the other hand it is much easier for such a man of himself or collectively with others to acquire an interest in any big mining concern. No new principle is involved. The formation of an investment fund by the Miners' Federation in each district on the lines of the Investment Trust Companies where each member contributes his savings to the common fund and receives his dividends (if any) in proportion, is all that is needed for collective share-holding. In the natural sequence of results of such policy invitations to suitable miners' representatives to join the board of directors might be expected.

(f) The remaining factor governing success or failure is the relation between the owners and the miners.

The interests of the owners and the miners are identical up to the point of the division of the profits, but in the matter of the price of coal may be opposed to the interests of the consumer, which have, however, hitherto been protected by free competition. The relations between the owners and the miners were not strained in matters of detail before the war. The National Coal Strike of 1912 was the outcome of a desire to raise permanently the standard of wages in the industry. The reason why the owners then forced the decision to be made by Parliament was that although the principle of a general minimum wage had been tacitly or expressly agreed for a good many years, they recognised that the level of that wage should be fixed having regard to the general economic situation of the country, and by an authority independent of both the owners and the miners. The ‘abnormal place’ question, of which we then heard a good deal, was a side issue, and its development has led to inefficiency. It must in future be the com-

munity as a whole who decide in a manner laid down by Parliament upon the level at which the standard minimum wage in our industry is fixed, whoever owns the mines. In 1912 all recognised that Parliament was not a suitable tribunal to discuss and decide details, but the Minimum Wage Act then hurriedly passed served the immediate purpose and admitted the principle. With that principle we do not disagree, and we understand that the recent Industrial Conference unanimously recommends the adoption of the principle in all industries. In our view, the level at which such standards of wages are fixed in all industries must be correlated to each other. No particular industry can for long have a preferential rate, and any preference imposes an unfair burden on other industries. A generation ago free competition between owners ran down the price of coal, and wages, unprotected by agreed or statutory standard, fell very low. As in the past, so in the future, prices of coal will fall, when the capacity for output of coal exceeds the demand at any general level of prices of commodities, to something like the average cost of production of coal in each district, and in the future, as in the past, the main factor of cost of production will be the standard wages. Any scheme must therefore provide an independent authority to fix the standard wages in the mining industry relative to the level of wages in other industries. The First Report of the Chairman and his three colleagues increased miners' wages to an extent that gives the miners preferential wages relative to those of the remainder of the community, except possibly their allies, the railway and transport workers. If it turns out that the remaining three-fourths of the community can be levelled up to them, no one will object. If, on the other hand, the consequential high price of coal creates unemployment, the level of the miner's wage must be reduced. Shortening the hours may be justified by the reduction of hours demanded and granted in other industries, but it adds greatly to the necessity for rapid development of the mines. In our particular industry a lot of sentimental nonsense is talked about the disagreeable character of the work. ‘Black’ is the characteristic colour of coal and the coal miner, as ‘white’ is characteristic of flour and the miller. It is proved that coal dust on the person is not harmful. It is not dirty in the true sense, but it excites much public sympathy quite wrongly. The standard of health of the miners is proved to be much above the average. Mining must always be a risky occupation, but it is not proved that State ownership would reduce the number of accidents; on the contrary, all available evidence seems to point the other way. The combined death rate from accidents and disease shows that the expectation of life of the miners is above the average. We should not have been able to attract so many additional men into our industry had the conditions of employment been relatively worse than in other industries. A true comparison shows that the British mines are the safest in the world. The desire for higher wages and shorter hours we all understand and appreciate, but if this desire be gratified in the coal trade beyond a point which is difficult to determine, and which is governed by the progress of other trades, the result must be prices above the economic level, and there is certain to be less continuity of employment, which is the worst evil of all, first in other industries and thereafter in the coal trade. Less manual work for more money can only be obtained by the application of science and mechanism to production in all industries, not only in one industry in particular. The benefit of such applications in the aggregate permits safe improvement in the standard of living of the whole community. The first benefits of the practical applications of inventions should belong to those who take the risks and work out the details of practical application. When any such application is proved successful it becomes the practice of the trade, and the benefits go to the community as a whole, but if the doctrine that the work done by the machine belongs to the workman, and not to the employer who provides the machine, is applied, progress is at once arrested. A good illustration of this is the

22 May, 1919.]

MR. WALLACE THORNEYCROFT.

[Continued.]

application of coal cutting machinery. The interests of the coal owner and the miner are in the main identical. While there always have been and always will be differences on matters of detail, there is no outstanding grievance to warrant the drastic change suggested. Under State ownership difficulties will not disappear. There are two types of grievances. A wise man described them as "grievances of suffering" and "grievances of strategy."

21,368. *Chairman*: Will you kindly tell me who the wise man was?—Lord Salisbury. He diagnosed the symptoms of these two, and came to the conclusion that a grievance of suffering was cured by concessions, but a grievance of strategy was aggravated by concessions. The strategy may have a laudable object, or it may not, but at the present time there is no doubt whatever we are dealing with a strategic grievance.

21,369. *Sir L. Chiozza Money*: What grievance was he referring to at the time?—It was a paper written by Lord Salisbury in 1873.

21,370. I wonder what the grievance was?—It was grievances in general.

"The relations between workmen and employers in all industries are at present under review, and we are quite willing to progress with others. A strike or lock-out is deplorable and prejudicial to the national interest, and while I do not suggest that freedom of action should be taken away, I do say that equitable negotiations are impossible if the right to strike remains in full operation, whilst on the other hand an owner's freedom of action is gone. Negotiations between owners and miners in the past have been carried on with good will and natural confidence, but no scheme will work unless a spirit of conciliation exists on both sides. It is want of knowledge of the facts that causes more dissension than any other factor I know of in a discussion between owners and workmen.

(4) *What the System of Private Ownership has done.*

This has been or will be dealt with in detail by other witnesses, but may be summed up by saying that it has provided all the coal required for national purposes at the lowest possible cost consistent with safety, and the capacity for output has periodically exceeded the demand owing to world-wide causes. In the past the alleged rapacity of owners was effectually prevented by free competition among them, which protected the consumer so long as the capacity for output about balanced the demand. Increase the capacity and the same forces will operate again. If and when the coal industry is set free from control, output will again be developed, and most of the difficulties created by control will disappear, but at what level of prices the trade will be carried on is difficult to foresee. Private enterprise has done all these things on the sound basis of free competition, and the profit earned by the trade as a whole has been so small as to require some explanation. It is a speculative industry. All investors hope when they put money into the industry that the particular venture they have elected to support with their savings will turn out to be one of the profitable variety that Mr. Smillie and his colleagues quote so frequently. Capital lost in proving and developing unsuccessful mines is lost sight of altogether. The system of private ownership and enterprise has built up the British Empire. It has taken risks that no Government department would take, neither in mining, which is one of the most speculative of industries, nor in any other industry. It is the application of science and improved methods of production to all industries by private enterprise that has rendered possible the higher standard of living of all classes of the community during the past generation. The higher standard of living that has been attained by the workers in the coal mines and in all industries is entirely due to increased productiveness of all engaged in the various industries of this country, and the increased productiveness is especially due to thrift and to the brains of those at the head of private enterprise. It is not true to say that the wage earners only get one-third

of the total* wealth produced. Many Socialists, opposed to the system of private ownership, hold that to save any money out of wages earned is wrong in principle and should be discouraged, and that a man should look to the State to support him in his old age. If this doctrine is upheld, progress cannot be maintained or accelerated; on the contrary it will be retarded, or at worst ruin to all will be the result. Thrift is the foundation of private enterprise, and of national prosperity. Success is always due to a man whose imagination conceives a scheme, and who by organising, administrative, constructive ability and hard work carries it out, using capital of his own or entrusted to him by others, and who is made or marred by the result. To such men and the system of private ownership and free competition the nation owes its leading position in the world, and the whole community has benefited thereby. A system with such a record is a national asset. *To depart from the system of private ownership as applied to collieries would be a national disaster. Evolution of the pre-war system is the only safe course to take.* To single out the Coal Industry for experiment is both dangerous and unjust.

(5) *Alternative Schemes.*

The Miners' Federation scheme as put forward by Mr. Straker may shortly be described as the purchase of the mines by the Government and the management of the mines by the miners and the miners. It appears from the evidence given that their policy of management would include abolition of tonnage rates for coal getting, and the payment of all workers underground by the day or shift worked.

Mr. Sidney Webb's scheme, as published by the Fabian Society in 1916, states that for the reasons suggested the time has come for the nationalisation of the coal supply, and as there is money in it, the Chancellor of the Exchequer should take the opportunity of making it help to pay for the war. The reasons suggested seem to me to be fallacies. The pre-war system of conducting the Coal Industry was not wasteful; new mines were not opened up here and abandoned there, irrespective of the aggregate supply and demand. The very fact that private individuals risk their own capital ensures that mines are not opened unless there is a very strong probability of the output being absorbed, and the fact that when a mine is closed capital is lost, most effectively prevents premature abandonment, and stimulates efficiency. That the Coal Industry has got to pay its share of the cost of the war no one disputes, but why should it be singled out from all industries, and will it be able to pay more if nationalised than its share under private ownership? I think not. Mr. Sidney Webb's detailed scheme given in evidence seems to be the purchase of the collieries by the State, and the management by bureaucracy advised by committees of the present owners, agents, managers and miners. The benefits suggested would apparently all go to the miners at the expense of the consumer or taxpayer. In section 6 of his proof he seems to object to competition. Is not competition all for the benefit of the consumers of coal! How can the economic value of anything either bought or sold be determined without competition? A trade carried on by the State without competition is bound to be extravagant at the expense of the taxpayer. We are accused of ignorance of each others' experience. Nothing could be further from the truth. There is no new method of working or of mechanical appliance devised that is not very quickly appreciated by mining engineers, and through the agency of the Institution of Mining Engineers and other kindred societies knowledge is quickly spread. The objects and purposes for which the Institution of Mining Engineers is constituted are 'The advancement of coal and iron ore mining and allied industries; and the promotion of the acquisition of knowledge necessary for control and direction of mining operations in relation to stratified deposits.' There was not chaos in the industry before the war. Bureaucratic control has, however, created chaos. The price of coal is not kept up, as suggested by Mr. Sidney Webb, to what will pay 'the worst situated, worst equipped and worst managed mine.' Such a

22 May, 1919.]

MR. WALLACE THORNEYCROFT.

[Continued.]

mine does not exist. What does happen is that when the capacity for output in any district exceeds the demand, the price of coal falls to about the average cost of production of that district. When the demand exceeds the capacity for output then the price rises until demand is checked by the high price or the capacity for output increased. Mr. Webb quotes the statement in Sir Richard Redmayne's proof that 'the present system of individual ownership is extravagant and wasteful.' A study of Sir Richard's evidence and cross examination leaves me in doubt as to what he meant to convey by that statement. Many owners, mining engineers and managers who have only had the newspaper reports of the proceedings have the impression that he accuses them of being wasteful and extravagant. I do not think he meant that, but rather referred to the system of the collieries being carried on by a great number of concerns and more to commercial than technical affairs. He appears to think that enhanced production and diminished cost would result from collective production. I have already indicated that well-designed amalgamation may tend in that direction, but to amalgamate whole districts such as Scotland, or even the sub-districts of Scotland, would have the opposite result. Management would become unwieldy and departmental, and from my actual experience I am satisfied that in Scotland wholesale amalgamation would not increase the output or decrease the cost.

With regard to his nine items of alleged prevention of waste:

(1) I think competition for export markets is good for trade.

(2) How better control of freights could be secured I do not know. I think freights are controlled by the world's demand for shipping.

(3) Administration of very small concerns is no doubt expensive as compared with big collieries, but our small shallow pits do, in fact, produce coal on a competition basis, and whether they are amalgamated or not they must have a certificated manager in daily attendance.

(4) In point of fact, capital is forthcoming for development of mines and always could be got before the war for any scheme that was economically sound. The output of Scotland was sufficient for the market demands.

(5) Whenever the purchase of materials in bulk gets beyond the capacity of one man to control for a group of collieries I do not think economy results, and some of the small buyers do as well as the big buyers, especially if they are good payers.

(6) How collective production could materially reduce colliery consumption I do not know, unless a vast amount of old plant were scrapped. By 'old plant' I mean existing plant.

The coal used in Scotland for colliery consumption is usually of very little value, and often quite unsaleable in ordinary times, and in many cases I have investigated, the scrapping of the old plant would not pay.

(7) As to harmonious relations between employers and employed I think the closer touch the head of any concern keeps with all the workmen employed, the less friction there is likely to be.

(8) Again, middlemen undoubtedly serve some good purpose or they would not be there at all. I agree that a well-organised colliery always tries to sell to and keep closely in touch with actual consumers, but there are many buyers of coal who prefer to buy from a merchant.

(9) In mining we have contact with almost every branch of science and technical development, and there are plenty of consultants available ready and willing to advise even the smallest concern on matters requiring special skill and knowledge. Improvements very soon get known through the Institution of Mining Engineers and kindred bodies.

On some of these nine points well designed amalgamation may tend to economy, but on some of them,

with all respect to Sir Richard Redmayne, I question his authority to advise, especially upon commercial matters. Superficial consideration of ideas put before him by others may have induced him to make what he called such a daring statement, but a study of his cross-examination leads one to the conclusion that he was by no means sure of the soundness of his statement.

Mr. Webb proposes a Ministry of Mines with the following branches:—

(1) *Safety and Health*.—Safety is at present dealt with by the Home Office, and although another witness is to deal with this question in more detail, I must flatly deny that collieries differ among themselves in the extent of their mechanical safeguards against accidents. The provisions of the Mines Acts are faithfully carried out. I also resent the following statement put in by Mr. Webb: 'The enormous number of accidents caused by insufficient use of pit props to prevent the falls of side or roof is very significant. *Pit props are now expensive.*' This is my opinion: that a member of a Royal Commission should put such an insinuation into a statement on oath, without one word of evidence to support it, appears to me to discredit the whole proceedings. Whatever may be the qualifications of Sir R. Redmayne to speak about waste and extravagance in management, we must admit his authority as Chief Inspector to speak of accidents, and we have it from him that *he knows of no case of any colliery owner who has refused on the score of expense to put into his mine anything to safeguard the lives of the workers.*

Another authority at the Home Office, Sir Henry Cuminghaime, K.C.B., in a discussion on the effects of dust inhalation, at a meeting of the Institution of Mining Engineers, stated:—

'The point to which he wished to bear the most emphatic testimony, after many years' experience of coal mines and coal owners, was that he had found the coal owners of Great Britain second to none in their determination to make sacrifice of money, industrial sacrifices, and sacrifices of the organisation of their mines, if once they could be persuaded that it really was for the good of the health of the working man and was a practical system and not a mere fad.'—(Transactions: Institution of Mining Engineers, Vol. LV., 1917—1918, p. 274.)

The health of the community is dealt with already by another Government department. Does Mr. Webb suggest that Dual Control in such affairs is beneficial?

(2) *Research*.—For this purpose a new department has already been set up. Does Mr. Webb suggest that it is inefficient?

(3) *Scientific Costing and Measurement*.—Costing and measurement, to be of much use, must compare like with like, and few collieries are sufficiently similar in underground conditions to make detailed colliery comparisons of much value.

(4) *Equipment and Stores*.—Mr. Webb suggests that a Government department could buy stores on a vast scale cheaper than an ordinary colliery company. I am sure they could not.

(5) *Allocation*.—War experience has convinced most people that allocation of fuel is the most wasteful and extravagant method of dealing with distribution. The *Minister of Mines*, according to Mr. Webb's scheme, would appoint a district superintendent, to be assisted by the council and criticisms of a Local Coal Council, and leaves the colliery manager in executive control, with the counsel and criticism of a Pit Committee. Those of us who have had long experience in the management of mines have no hesitation in saying that this scheme is impracticable.

The scheme put forward by Sir Leo Money is even more impracticable.

The report of the German Commission is very difficult to follow, but it appears unanimously to

22 May, 1919.]

MR. WALLACE THORNEYCROFT.

[Continued.]

reject Government ownership and bureaucratic control. It seems to suggest evolution from the pre-war system of working which was Government-owned mines in parallel with private ownership, but *without* free competition. To avoid the evils created by the German system of restriction of free competition common to many German industries, it suggests the creation of a Coal Council, consisting of 100 members, 25 being appointed by each of the interested parties—the coal owners, the management, the workmen, and the consumers, the latter being selected by the Government. The evils that it seeks to cure did not exist in this country before the war, but have to some extent been created by the Control during the war.

The French ideas have not yet matured. So far as I know, they may be summarised as follows:—

- (1) All existing and future concessions to be limited to 99 years.
- (2) A share in the dividends over a certain figure to be taken by the State.
- (3) A share of the total profits to be given in some form or another to employees.

Dominions.

All particulars are available in respect of the State-owned mines in Australia and New Zealand. Canada has a most efficient Department of Mines, which should be studied. Other Dominions are creating similar departments, and an Imperial body called the Imperial Mineral Resources Bureau has been created under the Presidency of the Lord President of the Council.

The duties of the Bureau are as follows:—

- (a) To collect, co-ordinate, and disseminate information as to resources, production, treatment, consumption and requirements of every mineral or metal of economic value.
- (b) To ascertain the scope of the existing agencies, with a view ultimately to avoid any unnecessary overlapping that may prevail.
- (c) To devise means whereby the existing agencies can, if necessary, be assisted and improved in the accomplishment of their prospective tasks.
- (d) To supplement those agencies, if necessary, in order to obtain any information not now collected which may be required for the purpose of the Bureau.
- (e) To advise on the development of the mineral resources of the Empire or of particular parts thereof, in order that such resources may be made available for the purposes of Imperial defence or industry.

The opinion of the Governors of the Imperial Mineral Resources Bureau as to the functions of a Department of Mines would be valuable.

Nationalisation.

Nationalisation or the purchase of the collieries by the State and worked by the State bureaucracy is a

definite proposition. It may have some advantages, most, if not all, of which can be achieved by private ownership, but in any event such advantages are far outweighed by its disadvantages.

Unification.

Unification is a vague term, but seems to mean the creation of a huge trust, which is certain to be uneconomical in its working, and will directly increase the cost to the consumer or be a charge on the revenue of the country, and is not acceptable to anyone. It is very difficult to support the view that unification would bring about improvement of itself. Much more depends upon the ability of those in control. Unification would not produce the best men and could not give them a free hand which is very necessary. Men that can efficiently direct all the operations of a concern producing one to five million tons are not very common, even when such concerns are in one district with common customs, &c. It is not possible to find a man to direct and control efficiently two hundred and fifty million tons of output, produced at present under greatly varying conditions by many different undertakings.

Joint Control.

Joint control is also vague, but if it means divesting the owner, agent or manager of executive power while holding them responsible for the safety, efficiency and economy of the mines, it is impossible.

Evolution.

The scheme for the future organisation of the industry outlined by Lord Gainford is designed to free the coal industry from certain difficulties in connection with the right to work minerals of which a great deal has been heard. It will create a Mining Department which (*inter alia*) should collect all the statistical information required, and not at present available, to guide the future Ministers of the Crown in matters of trade policy, and such information will be available to both owners and workmen for the purpose of settling rates of wages on a sound basis, and in relation to the economic conditions of other industries dependent on coal. I strongly recommend its adoption as soon as circumstances permit the coal industry being released from the present system of control, which was improvised under the stress of war conditions, but which will be intolerable and highly detrimental to the national interest when peace is declared and normal trading becomes possible.

Chairman: The position is this. I am asking Mr. Smillie and Sir Adam Nimmo, who come from the same district as Mr. Thorneycroft, to cross-examine; but Mr. Smillie has had to go away. Which would you like to do, Sir Adam; would you like to go on now and finish your examination, and let Mr. Smillie go on in the morning, or would you rather wait and let Mr. Smillie go on first, and you come second?

Sir Adam Nimmo: I think it would be only right that Mr. Smillie should cross-examine the witness first.

Chairman: Then I will call Sir Frank Beauchamp, the witness for the Bristol and Somerset coalfield, who stands in a separate position.

(The Witness withdrew.)

Col. SIR FRANK BEAUCHAMP, Bart., Sworn and Examined.

21,371. *Chairman:* "Coal Industry Commission.—I am a colliery owner in the Somerset Coalfield, and have been connected with the mining industry there for over thirty years. The collieries owned by me, or in which I hold a controlling interest, produce nearly one-third of the output of such coalfield. I, like many other colliery owners in Somerset, work considerable areas of my freehold coal. I am Chairman of the East Bristol Collieries, Limited, producing over 60 per cent. of the output of the Bristol coalfield."

Witness: I should like to say that, although I only represent those districts, Somerset, Bristol, and the

Forest of Dean, those are not the only districts which have had such a large increase in cost as compared with some of the more fortunate districts where the output per man is higher and consequently their wages cost is not increased to the extent that ours is.

21,372. *Chairman:* What are those districts?—North Wales is one that I have particularly in mind, Lancashire and Cheshire and North Stafford and West Yorks. I took, judging from the figures furnished by Mr. Finlay Gibson, who proves the increase of war wage per ton of output, and from that one can gather that the output per man must be low for the increase

22 May, 1919.]

COLONEL SIR FRANK BEAUCHAMP, BART.

[Continued.]

in war wage to add so much more in those districts than it does in the other districts. Of course, I do not know anything about the increased cost other than the wage cost, which I judge from the war wage. The war wage and the wage cost are before this Commission for every district in Mr. Finlay Gibson's report, so that I did not trouble you with the figures, because you already have them.

21,373. You are not giving evidence for Lancashire and Cheshire?—No, I am only giving evidence for the three districts with which I am thoroughly acquainted.

"I represent the districts of Somerset, Bristol, and the Forest of Dean. I have been requested to give evidence to this Commission by the Coal Owners' Associations of these three districts, as they realise that their position and ability to compete in the open markets as in pre-war days has been so altered that before coal control ceases it is absolutely essential to provide some scheme whereby these districts and others similarly affected can carry on, especially having regard to their large coal reserves and situation as regards markets, which are of great importance. The districts, according to the report of the Royal Commission in 1903 on coal supplies, contain a reserve of over 6,000,000,000 tons of coal; there are 42 pits which in normal times were producing from 2½ million to 3 million tons of coal per annum, and at present employ over 15,000 men and boys."

I have a map here. I have not sufficient copies for the whole Commission, but I have one for each side of the table and one for the Chairman. On that map, coloured in red, you see the various coalfields in the country, and the south-west corner coloured in blue is the area of the markets in which we sell our output.

21,374. It is a very useful map?—I have put that in to show that the coal from our districts can reach that market by a shorter railway route by 60 or 70 miles than some of the districts, and from some of these places, if the districts are shut up, the coal will have to be brought for 150 miles. For that reason I say that I consider the areas, though small, with very large reserves, are very important, and it is essential, to my mind, that these districts should be maintained.

"I have given the figures as to comparative outputs and costs so that the Commission may have before them in a concrete form the position of the districts which I represent; such figures prove the absolute necessity of making provision for the relief of some of the burdens, if they are to continue, whatever scheme may be adopted to carry out the recommendations embodied in paragraph 9 of the Interim Report of March 20th, 1919, signed by Mr. Justice Sankey and three other members of the Commission.

I am in agreement with the evidence given by previous witnesses on behalf of the coal owners as to nationalisation, and also any system of dual control in the management of the industry, to both of which I am strongly opposed. The nationalisation of mines and removal of the incentive accruing by reason of ownership, and the replacing of the owners by State-paid officials would, in my opinion, have the same effect as the removal of the whole contract and piece-work system in this country, and at the same time drive the most efficient and keenest business men, who in the past have been responsible for the development of the resources of this country, to seek employment for their capital and brains in other countries, as such men would not accept appointments as State officials with opportunities and salaries regulated in most cases by length of service, and not necessarily by efficiency or results.

Coal Produced.

Good house, gas and steam coal are produced in these districts, and in the past such coal has competed in the markets with that from other districts (where the output per man is much higher), in consequence of the following facts:—

1. The geographical position of the coalfield, especially as regards Somerset and Bristol, has enabled the colliery owners to supply the markets in

the south-west of England owing to their being 60 to 150 miles nearer such markets than other competing coalfields.

2. A considerable proportion of the coal, in some cases 80 per cent. to 90 per cent., from the three districts, is sold by the colliery owners direct to the consumers, thereby saving the profit of the middlemen."

21,375. Do the consumers fetch it themselves, or do the coalowners arrange for distribution?—Both. In Bristol itself we are in the centre of a very large consuming community and a very large proportion of our coal, in fact, over 60 per cent. of the output, as you will see in the next paragraph, is delivered direct to the consumer by water and road transport—mostly by road transport. We have a very large consumption which goes direct from the collieries, either in motor lorries or carts, to the consumers' cellars, or if it is to an industry, it goes to the industry without the middlemen's profits, and it is for that reason that we have been enabled to live as long as we have.

21,376. What is your cost of distribution per ton? In many cases we have heard that it goes through several hands. Now we have got to a case like yours where you distribute direct. Can you give me any idea what addition to the pithead price there is by the distribution?—It varies very much, because some of our coal is going by water. We supply the Bristol Corporation. That coal goes direct into the barges, and it goes straight from the colliery tram as it comes up the shaft into a barge, and the corporation have mechanical means for unloading it at the side of their works, and there the cost is extremely small. I think the cost is about 1s. 6d. a ton.

21,377. Is that canal-borne or river-borne?—It is canal-borne really; it is a cut. Then distribution by road and cart varies considerably according to the distance and the quantity. We deliver some of it with our own motor lorries in large quantities; of course there we can deliver that from 1s. a ton and upwards, according to the distance we have to go.

21,378. You say 1s. a ton and upwards: what is the minimum distance represented by the 1s. a ton?—I suppose we should take it for 1s. a ton by motor lorry about 2 miles or 2½ miles.

21,379. I am asking you this question because you stand in a rather different position. In the Bristol district about 60 per cent. of the output is delivered direct to the consumer by water and road transport, thereby saving the railway carriage, and, in some cases the cost of double handling. With regard to the Somerset district, the majority of the coalowners there possess their own railway wagons; therefore a proportion of their profit is made out of their railway wagons and royalties, but for which their profits would be sometimes nil, so that the profits in roads include the earnings from our railway wagons, for which we had to make an outlay of capital as also in the case of royalties.

21,380. Is that the Radstock district?—Yes, it is called the Radstock district. It is the Somerset district.

"The rates of wages paid were below the average elsewhere, and when the Minimum Wage Act was introduced special and lower rates were fixed to meet the disadvantages of the districts. The Miners' Federation of Great Britain has also for many years agreed to a lower percentage being paid on the standard rates of wages compared with that in force elsewhere, recognising that an all-round percentage advance throughout the country adds a greater cost per ton in these thin seam districts compared with others. Without this concession many pits would have been closed long since."

21,381. You have finished the question of coal produced. Is any of your coal used for export purposes?—A little in the Forest of Dean.

21,382. Is that exported from Lydney?—Yes. It also goes down as far as Monmouth.

21,383. Is there any used for export to foreign countries?—Yes, a little of it goes to France and Italy.

21,384. Is that by small sailing vessels or colliers?—Yes, small vessels.

22 May, 1919.]

COLONEL SIR FRANK BEAUCHAMP, BART.

[Continued.]

21,385. What is the average tonnage—100 tons?—I could not tell you. They are small ships and they go to France, etc.

21,386. Small brigantines, I suppose?—There is some of which is, of course, not exported, that goes by water down the South Coast of England from the Forest of Dean. I think the biggest boat they load is from 200 to 300 tons.

21,387. Do you export from Sharpness also?—Yes.

21,388. Do you go over the bridge?—Yes, that goes over the bridge.

21,389. What is your export from Sharpness?—I do not know what the quantity is.

21,390. It is very small, I suppose?—It is very small. The main trade of the Forest of Dean is inland trade round the South-west of England and Ireland.

"Capital Outlay.

This is very high in proportion to the tonnage of coal landed, consequently a larger profit per ton is necessary to produce a moderate return on the investment. Some of the shafts are 650 yards deep, and coal is being worked to a much greater depth"—we have long slants or inclines which are driven down below the bottom of the shaft—"and owing to the thin seams (some of 13 inches and 14 inches and 15 inches are being worked), the varied and disturbed nature of the coalfield, and the large areas and long face room required to produce a moderate output, what may appear an excessive number of shafts are required. The average output per pit per week is low, being as follows:—

Somerset.	Forest of Dean.	Bristol.
8-900 Tons.	13-1400 Tons.	10-1100 Tons."

21,391. Have you any coal cutting machines in your district?—We have tried them. At the present time I have one pit working coal cutting machines. I could tell you some of the difficulties of that, if you would like me to.

21,392. Have you any conveyors?—No, we have tried conveyors, but we have had to give them up because the seams are so thin, and the district is so disturbed with faults that we never get a long enough face roof to instal conveyors successfully.

"Working Costs.

These are extremely high for the following reasons—

1. High inclination, necessitating a large number of incline haulages—self-acting and otherwise.

2. Many pits are heavily watered; in some cases 30 tons of water are raised to every ton of coal, and colliery consumption and standing charges are consequently very high owing to the small output.

3. Timber costs are high compared to some competitive districts, approximately one ton of timber being used for every 30 to 40 tons of coal produced."

21,393. You import timber to Bristol, I suppose?—Yes; and, of course, we have had the great advantage of being able to buy locally. A lot of our timber comes from the New Forest into the Somerset coalfield.

"Workmen's Compensation Insurance: In these districts the insurance companies' rates amount to over 6d. per ton of coal landed, due to the low output. This cost could be reduced to some extent by the provision of a State Insurance Scheme, or as an alternative the employers in each district could combine for the purpose of forming a District Insurance Fund."

I may say, where that has been done it has been found that the cost of compensation is far less than the insurance premiums that the insurance companies demand. For a very long time I ran my own insurance fund, and it was not till the Coal Controller was in possession, when he practically ordered me to take out a policy of insurance, that I did so with an insurance company.

21,394. In the Forest of Dean, I suppose, they are mostly naked light pits?—Yes, and Somerset.

"The output per shift of men and boys is low, due to the thin and faulty nature of the seams necessitating the landing of large quantities of rubbish, in some cases as much as two tons for every five tons of coal produced.

The output per shift of men and boys is low, due periods:—

	Somerset.	Forest of Dean.	Bristol
In 1914 ...	14'38	... 15'5	... 12'2
In 1918 ...	13'62	... 13'75	... 10'4
1919			
To end of April.	12'39	... 12'25	... 10'7

21,395. Mr. Evan Williams: Is that per man employed?—Per shift per day.

21,396. Per hewer?—All men employed.

21,397. Surface and underground?—Yes, surface and underground—the number of shifts worked.

21,398. Chairman: With regard to your miners in your district, are they mostly people from the district or do you get strangers coming in there?—They are mostly from the district. It is a sort of home of their own.

21,399. I suppose a lot of your miners live in their own houses?—Yes, a very large number. I state that later on:

"From the above figures it will be seen that there is a serious reduction per shift since 1914, and this, notwithstanding the fact that in response to the request of the Coal Controller's Department, development work as far as possible was stopped and the thicker seams worked to secure the largest possible output in view of the shortage of coal throughout the country."

One serious trouble we have now in view as the result of that stoppage is that we have now to carry out our own development work, which consists of driving short branches through faults, and all that will have to be carried out in the future at a much greater cost than if we had carried it out as it had gone on, because the cost is continually going up. The Government Department have admitted that this development work should have formed part of the charge of working the collieries in the past, and they have sent down to inquire into the circumstances; but we are claiming that we ought not to be called upon to pay Excess Profits Duty, because our profits have been increased above what they would have been had we carried out our development work and had we continued to work our fair proportion of thin seams. We are claiming that we ought not to be called upon to pay the Excess Profits Duty, seeing that we did it to meet the needs of the nation.

"The figures prove that increased wages, together with increased minimum wages and the flat daily rate of war wage, has resulted in reduced efficiency on the part of the men. This is especially applicable in the case of young lads upon whom the coal getters' output depends, and illustrates the error made by the Government Department responsible for such advance in giving the lads with no dependants the same war wage as was given to married men with families to maintain.

This granting of flat rates of increase is to my mind a proof of what would happen in the case of nationalisation, under which all Stato employees engaged in the same class of work would expect the same pay irrespective of their earning capacity."

21,400. Chairman: I suppose most of your lads are the sons of miners?—Yes, most of them.

"Advances in Wages and Costs since 1914.

Since 1914 and during the period of control not only has the same percentage of advances been granted in this district as was given in others, but the miners have secured advances of the minimum wage rates and many of the day work rates, thereby bringing the rates of wages in these districts nearer those paid elsewhere. Reductions in hours of surface workers have also increased costs disproportionately to other districts. The effect of this and the all-round ratio of

22 May, 1919.]

COLONEL SIR FRANK BEAUCHAMP, BART.

[Continued.]

3s. per day war wage and 2s. per day under the award of Mr. Justice Sankey, has been to increase the cost per ton in these districts far more than that of some of our competitors, the percentage increase being very much greater, as shown by the following table:

21,401. We will take some of those. The Table shows that in the Midlands, Notts and Derby district, the percentage increase per ton is 52·40, Leicester 49·50, Monmouth and South Wales 45·62, Warwick 56·52, Notts and Erowash 55·88, Somerset 66·66, Forest of Dean the same, and Bristol 69·14. Those latter are the three largest?—Yes. "It will be seen by these figures that the Bristol district is placed at a disadvantage of from 4s. 9d. to 6s. 8d. per ton as compared with their principal competitors. The differences on war wage are at present adjusted by the Coal Control Department, and the money required to pay the Sankey wage is being provided by Government." If control were removed to-morrow, Leicester would only have to pay 4s. 2d. to cover the Sankey wage and the war wage, whereas Bristol has to pay 10s. 10d.

21,402. What is the freight?—The same as before the war.

21,403. What is the rate?—I can furnish you with the rate. It is 5s. 10d. from some of the pits in Leicester.

"Reduction in Hours.—A reduction in hours will increase the relative costs and disadvantages of these districts as compared with our competitors, consequent upon the small output per man. And as our output depends to a very large extent on carters and putters and runners, whose number is limited (there are no lads of this class in the districts available for employment), additional shifts cannot be worked to maintain present output."

21,404. Have your men far to go to get from their houses to the pit?—Not very far. Most of them live in little villages round the different collieries.

"Owing to the high gradients, the faulty and disturbed nature of the district, and the number of small areas between faults which must be worked at the same time to maintain any reasonable output, it is practically impossible to provide mechanical haulage to any large extent, and thereby reduce the time taken by men travelling to and from their working places."

It has been suggested that men could be taken by mechanical haulage into their works, but as we have a very large number of what we call self-acting inclines in our district where the coal is let down, if the men had to ride to their work it would necessitate their changing from the level road, going up an incline, then to the road, and then going up another incline several times, and we should have to put in machinery to pull those men up the incline.

"Coal Cutting Machines.—Coal cutting machines and conveyors have been tried; but for the same reasons have proved in most cases impossible, and in those far more expensive than hand labour."

There is only one thing that it occurred to me would help us with regard to these coal-cutting machines, and that is to have a regulation whereby the machine men's hours would be limited by the week and not by the day. Where you have a short place between two faults, and you put three men with a machine, if everything goes well they cut through the face in five hours or six hours, and they have nothing more to do.

21,405. Mr. Herbert Smith: Have you ever considered the advisability of employing self-acting machinery to get men in and out of your pits, weighted with a balance weight?—It could be done in the same way that we let the coal down the inclines. We could keep a balance to pull the men up. That could be done. If we pulled our men up in that way it would mean in the first place, when they got down to the bottom of the shaft, they would have to wait till there was a sufficient number to ride in the first main road; then when they got out, they would have to be transferred to the self-acting incline, where they would get up by a balance. Perhaps they would go for a hundred yards, and then up another incline, and so on.

21,406. Chairman: Were the dukies arranged in your district?—We had what we call "dukies." They were dip ways.

21,407. I do not think you told us with regard to the number of men: am I right in thinking that in 1912 in Bristol and Somerset 6,448 men were employed?—Yes.

21,408. And the Forest of Dean 8,524?—Yes. There are not so many men there now.

21,409. How many in Bristol and Somerset are there now?—In Bristol and Somerset now there are about 8,700.

21,410. And in the Forest of Dean?—About 6,500. I was saying about the coal-cutting machines: before you can bring your machinery to cut back down the face, you have to clear the coal, and if the machine, through some fall in the roof or a disturbance in the bottom, is stopped, and they cannot get through their whole cut of 40 or 50 yards in the 8 hours' shift, those men have to come out. Perhaps the machine will finish all but 10 yards. The first day they can cut 5 yards, if all goes well; if it goes badly, they cannot cut it in the 8 hours. The result is that you have to have another shift to come in and cut the 10 yards, and they cannot do any more work.

21,411. Mr. Herbert Smith: That is not only the case with this coalfield?—I am expressing my opinion that it would be possible, if you had a limit of hours fixed by the week and not by the day, that it might overcome some of those difficulties.

21,412. Chairman: You have put in a very useful table,* and we will just glance at the comparative cost of wages. "The effect on coal sold, which is the only source of revenue, is serious, as is shown by the following figures, from which it will be seen that the difference between wages cost on coal landed and sold is enormously increased"?—I give some figures there which I can give you shortly. You will see from those figures that in Somerset in 1914 our wage cost on colliery consumption was 6.67d. per ton of coal. From January to April, 1919, that is increased to 2s. 8·22d. per cent. owing to the increase in wages.

21,413. Mr. R. W. Cooper: Have you the percentages of the total raisings, the quantity sold, consumed and wasted?—Yes, I can give you those figures. The colliery consumption in the Forest of Dean has increased now to about 15 per cent. In Somerset it is about 10 per cent., and in Bristol it is just under 10 per cent.

21,414. Does that include waste and brasses?—It does not include the percentage of waste that we wash out of the coal in the Bristol district.

21,415. What would that come to?—About 20 per cent.

21,416. What is the total difference between your raisings?—The difference between the coal raised and the coal sold.

21,417. How much per cent. is that?—These figures are worked out. The percentage varies from 15 per cent. in the Forest to 10 per cent. in Somerset, and about 10 per cent. Bristol.

21,418. That has to come off the raisings?—Yes.

21,419. Chairman: In other words, the first column shows the amount you get out of the pit, and the next, the amount you sell?—I can give you those figures presently. The Forest of Dean, the figure for wages cost on colliery consumption in 1914 was 5d.; it is now 3s. 7·25d. In Bristol in September, 1914 it was 1s. 1.4d.; it is now 2s. 9·5d. Now that cost in Bristol has not increased to the same extent as it did elsewhere, because it was much higher to commence with. In 3 or 4 collieries in Bristol we have introduced electricity, and we purchase the power from the Bristol Corporation, so that we are not burning the coal that we were burning in 1914. The next item is: "The actual cost of war wage and the advance granted under the Sankey report for the period from 9th January, 1919, to last making-up day in April as furnished by the respective collieries." These figures are taken as far as possible from the returns that are sent in to the Coal Controller's Department, and are handed in with the certificates that those amounts have been paid to enable them to obtain the money, so that I think

* See Appendix 70.

22 May, 1919.]

COLONEL SIR FRANK BEAUCHAMP, BART.

[Continued.]

you can take it those figures are practically correct, from which you will see that in Somerset the war wage and the cost is 5s. 7d. per ton, the Sankey wage is 3s. 6d. per ton, making a total of 9s. 2.06d. For the Forest of Dean the total cost is 9s. 5d., and in Bristol the total cost is 11s.

"Future of the Industry."

In view of the before-mentioned facts I have given long and careful consideration to the position of these districts if the present control were removed, and each district allowed to compete in the markets as in pre-war days, with the very large and disproportionate increase in costs. Such increased costs are to a very large extent due to the action of the Government Departments in granting all-round advances in wages without any consideration as to the variations in additional costs; and before control is removed it will be necessary, unless the districts are immediately to close down, to make some provision to enable these districts (which are at present receiving from the Government 3s. 6d. to 6s. 10d. per ton in respect of the war wage and Sankey wage) to compete in the markets, as it would be impossible to advance prices to this extent over and above any advances made by our competitors.

There are some possibly who are of opinion that, owing to the high cost of working and with cheaper coal available elsewhere, it would be advisable to allow these districts to close, and that the nation should secure its coal supplies from the districts which can be more cheaply worked, and allow posterity to work the more expensive at some future date. Those who take this view, 'to be consistent,' would no doubt consider it advisable to leave all the thin seams in every district, and work out and exhaust the thicker and more cheaply worked seams first. This to my mind would be nothing short of a calamity.

A great deal of consideration is being given at the present time with a view to reducing to a minimum transport over the railways; if these districts are closed all coal to supply their markets would have to be conveyed over an additional 60 to 150 miles.

As an instance, Bristol City, the largest in the West of England consuming over $1\frac{1}{2}$ million tons of coal per annum, would have to obtain supplies from a distant coalfield.

Another result of closing these three coalfields would be the ruination of the whole district, as with the exception of Bristol there are no other industries in which the men could find employment, it would be necessary to transfer the whole of the miners to other districts, provide housing accommodation, not only for the miners, but for those of other trades in the districts dependent upon the industry. The older men in the mines would have difficulty in finding employment elsewhere.

The large amount of local and county rates at present paid by the colliery and other industries connected therewith would be lost, as also the life savings of a very large number of miners who have built or purchased their own freehold houses."

21,420. *Chairman*: Is it your suggestion that in your case there must be some unification or grouping to help you get along?—Not only that; there must be some sort of unification in our own district, but we must have some sort of assistance from other districts, or give us a close area for the sale of our coal.

21,421. Would nationalisation help you, do you think, to realise that?—If we had nationalisation, I take it that we should no longer have any interest in the coal industry. We should not want assistance then.

21,422. It would prevent them being shut up?—That would depend upon the State. If the State decided that it is the right principle for this district to continue, nationalisation would, of course, be a solution.

"Housing."

In these three districts the miners' houses are, as a general rule, good, and are provided with good

gardens. Large numbers of these houses in Somerset, and nearly 50 per cent. in the Forest of Dean, are owned by the miners themselves. In Bristol the miners form less than $\frac{1}{2}$ per cent. of the total population. It appears, therefore, very unreasonable to saddle the mining industry in these districts with the charge of 1d. per ton to raise a fund to provide houses in other districts, and I fail to see why in a place like Bristol, where the mining community is such a very small percentage, houses should be provided at the cost of the coal industry (which is one of the oldest), when in all probability members of the miners' families would be engaged in the industries such as tobacco, the manufacture of chocolate, and the other general industries in the city.

In several districts producing large quantities of coal the wages costs per ton have increased to a far greater extent than in other districts, and unless some provision is made to meet these additional costs there would appear to be only two alternatives, viz., a large reduction in wages to the men in such districts, or the closing of the same and the transference of the men elsewhere. Much as I, personally, am opposed to the nationalisation of mines, I would prefer even this alternative as a lesser evil to the nation than the closing of whole districts which are at present supplying important markets, and which contain very large reserves of coal.

After careful consideration, I am of opinion that in the national interest it is the duty of the Government to make some arrangement for keeping these districts alive, and I would suggest the following scheme, which is put forward not on behalf of the coal owners as a whole, but as an expression of my personal views. I may add, however, that a large majority of coal owners in the districts I represent approve of such scheme, believing it to be a far better solution than Nationalisation."

21,423. What does that exactly mean? You say: "I may add, however, that a large number of coal owners in the district I represent approve of such a scheme, believing it to be a far better solution than nationalisation." You say it must be either a scheme or nationalisation?—Yes.

21,424. A large majority are in favour of the scheme: are the rest in favour of nationalisation?—Not necessarily. I know there are some who are in favour of nationalisation. There are some who are not represented on our Association, and I can only speak for those I represent.

"Proposed Scheme."

It is, I think, an admitted fact that, provided any industry as a whole is only receiving a fair remuneration on its capital, any increase in cost of production must be and is transferred to the consumer. Assuming that previous to the war the prices of coal in all districts throughout England as regards competition between one district and another had adjusted themselves, it is fair to assume that in the future the same relative prices between the various districts could be maintained whether the prices for the whole country go up or down. To meet a demand from the miners of an increase in wages of say £50,000,000 it is necessary to increase the price of coal sold by that amount, and it appears only fair that the whole of the consumers in the country should pay a proportionate share of such increase, and therefore the prices of coal should be advanced everywhere to the same extent. Owing to low outputs and high wage costs in some districts, a 10 per cent. or 20 per cent. increase in wages doubles the increased cost in one district as compared with another, and if the principle of giving all miners a similar advance in wages is continued, it is unfair that the consumers in the district where the additional cost is greater should be called upon to pay an increase of 2s. to 3s. per ton in the price over and above the increase paid by consumers in other parts of the country. If this principle is adopted, what is required is machinery for transferring the £50,000,000 (paid by the consumer to cover the increased wage to the miners) through the employers to the men.

22 May, 1919.]

COLONEL SIR FRANK BEAUCHAMP, BART.

[Continued.]

This could be done on a similar basis to that adopted by the Coal Controller for payment of the war wage, whereby he is credited with 4s. per ton of the selling price of coal throughout the country and pays the war wage in proportion to the varying costs where same exceed 4s. per ton.

My suggestion, therefore, is that each district should be responsible for their pre-war wages; that all advances in district rates since that time and for the future, and any general advance throughout the country should be operated through a central fund provided on similar lines to the existing war wage. A central committee representative of all coal producers would be set up to collect and administer this fund and regulate prices."

21,425. What is the composition of that Committee? Are the men to be represented on it?—There would be no objection to the men being represented on the Committee, but it is really a question of collecting the money and distributing it. I do not mean by that that it is on similar lines to the existing war wage.

21,426. You said all they had to do was to collect and distribute, but it struck me that according to your scheme they had to regulate as well, and that is why I asked whether the men were represented?

Sir Arthur Duckham: To continue the controlled price?

21,427. Mr. R. H. Tawney: Do you suggest that?—No, I do not suggest that. I do not suggest that the control department should continue.

21,428. Chairman: What about the Committee?—Perhaps I might read this through and then perhaps you will ask me about that later, and I can then explain the whole scheme.

"Assuming the total increased wages amount to £50,000,000 on a total output of 250,000,000 tons of coal, that is 4s. per ton, this would then be allocated over the various districts in proportion to their tonnage cost and output—viz., if any one district had an additional wage cost of 3s. per ton, such districts would contribute 1s. per ton to the central fund, whereas a district whose wages cost was increased by 5s. per ton would receive an extra shilling per ton from such fund.

This suggestion does not propose to help the badly-managed at the expense of the well-managed colliery, and each district would naturally contain an organisation where all results of wages and claims would be tabulated, and the accounts made up for claims upon the central fund. Such district organisations would divide the amount received for the whole district in proportion to the cost at each colliery, and if it were found that any colliery in the district had an extravagant claim they would have the power to reduce that claim, and the colliery company so concerned would have either to pay any difference themselves or close the colliery should they think fit. Such individual colliery to have the right of appeal to the central committee set up for the purpose of controlling the coal trade as a whole."

21,429. Now I will ask a question about that. What is the composition of the Committee?—My proposal is that you should have some central committee which regulates prices and wages, and on that central committee you must have representatives of the owners, the miners and the consumers.

"Royalties and Barriers."

Some central authority should have power to secure the adjustment of areas to be worked with existing pits, and the position of any new pits sunk should be approved by them.

There is no necessity to add to the present financial burdens of the State by the purchase of royalties. The central authority could vary the terms of existing leases where necessary, and fix rates of royalties and wayleaves on a tonnage basis according to the quality of the coal and conditions under which same exist. Such authority should also have power to order the granting of leases of areas of minerals where the owner would not let or agree to the usual terms in force in the district, and to adjust existing and provide for the minimum amount of barriers in the future.

Colliery Consumption.

If the Government scheme of power stations becomes operative, collieries will be able to obtain their power from same. Failing this, districts should combine and provide central generating stations for all colliery power. Where possible central pumping stations for dealing with the water from the most economical point should be provided, and the cost borne in proportion to the benefit to each colliery affected.

Selling Prices.

Any scheme adopted should in my opinion contain regulations for dealing with selling prices and distribution. I would suggest that the coal in each district should be pooled and sold by a central organisation, the profits or losses on such sales being distributed amongst the different collieries in proportion to their output.

Purchase of General Stores and Supplies.

The central organisation would also purchase supplies for the collieries. By these means the selling of coal and purchasing of stores would be carried out at the lowest possible cost and with the least possible competition."

21,430. Chairman: When you say the central authority, I do not quite follow it; is it to be an authority for the kingdom, or an authority for each district?—I should say an authority for each district, because the districts vary so much.

21,431. Which districts are you thinking of, the Home Office districts, the Federated area districts, or the minimum wage districts?—In our districts we have a separate minimum wage district for Somerset, and Bristol, and another for the Forest of Dean. These three districts might be combined. There is no necessity to have these three separate districts for that small area.

21,432. How many districts are there for Scotland and England; have you worked it out?—No, I have not worked it out, because I am not sufficiently acquainted with the other districts.

Chairman: I am sure the Commission are very much obliged to you for your evidence.

21,433. Mr. Frank Hodges: I should like to get one point clear; and that is about the population of these areas. Is it not a fact that within the last 20 years your lads growing up have emigrated to a very large extent from these coalfields into what they consider to be more remunerative coalfields from the point of view of wages?—Some of them have, the younger lads.

21,434. And to a very considerable degree, I think you point out in your *précis*, your workmen are for a considerable part elderly workmen?—Not a considerable part.

21,435. Would you say a larger proportion than in another district, say, like South Wales?—I should not think so.

21,436. I rather gathered that because you say so cannot get boys to work?—When I say we cannot get boys to work I mean at the present time, if we reduce the number of hours—take Somerset, for instance—our breakers are already working 7 hours, and our carters and putters are working 8. If we got an hour's reduction in July we shall either have to discharge some of the breakers, or convert them into putters and trammers, because the boys who are now doing the putting and tramping will lose an hour, whereas the breakers will not lose an hour, and there are no extra boys in the district to come into these mines.

21,437. That is so. As a matter of fact, if figures could be produced, we should find that gradually over 20 to 25 years the migration of miners from those coalfields to other coalfields was greater than any other district in proportion?—That may be because the development in our coalfield has, perhaps, not been so rapid as elsewhere, because we have only had a limited market, and once we exceed the supply that that market can take, it reduces our price and prevents us making a profit.

22 May, 1919.]

COLONEL SIR FRANK BEAUCHAMP, BART.

[Continued.]

Sir Arthur Duckham: Would you ask whether they have gone to other trades as well?

21,438. *Mr. Frank Hodges*: Sir Arthur Duckham would like me to ask if they have gone from the mining industry to other trades?—They have to an extent, but I generally find that a mining family remains a mining family to a very large extent.

21,439. With regard to wages, you refer in your *précis* to the fact that the Miners' Federation has agreed to a low percentage being paid on the standard rates in those districts of Forest of Dean, Somerset and Bristol as compared with those in force elsewhere. Is that not due to the fact that the Federation has always feared that if you had to pay the average percentage of the other districts or the average standard of rates, you would have, under private capitalism, to go out of production altogether?—That has been, I think, the view. I think the Miners' Federation have seen it in the same light as we have, that unless these districts are assisted in some way like that, they would have to close.

21,440. So that, although the work of the miners in these thin seams in your district is as hard—I will not put it harder, but I believe it is harder—as the work of any other miners in any other district, in the interest of maintaining the system in that district they have been agreeable to accept lesser wages in the past?—They have accepted lower wages. I think there are, perhaps, other reasons. They are much nicer districts to live in than some of the colliery districts I have seen elsewhere. The miners' villages in our part of the country are as pretty as agricultural districts, and you cannot say that for all the other coalfields in the country. Their house-rents are low, and the living in some districts, I think, is cheaper. We find that when some men go away, and they hear of very high wages in South Wales, for instance, they go, but it is only for a little time; they do not stop long.

21,441. That cannot be so, because the number of men employed in your coalfields is diminishing?—They diminished like everybody else during the war.

21,442. If the Bristol, Forest of Dean and Somerset miners now say, "The time has come when we will have the average wage of the coalfield as a whole," and the Miners' Federation say, "You are right in your proposition," and the Miners' Federation say, "We will endeavour to get for you the average wage of the Kingdom," you would have to go out of production?—To a very large extent. There may be some pits, perhaps one or two in each district, where the cost is less than in others where you could supply a small local market which could continue to exist.

21,443. That would be a calamity, I take it, especially in view of the facts in your *précis*, and in view of the fact that you have 6,000,000,000 tons of coal estimated geologically that can still be worked?—I think it would be a great calamity.

21,444. You do not think the coalowners' scheme as put forward by Lord Gainford would meet your particular difficulty?—Not unless the scheme were enlarged and added to to make provision for this district and other districts similarly situated. I do not know much about North Wales and others, but I do know from their cost there they would probably want some assistance if the Coal Control were removed. The other alternative is to give them a close market and prevent anybody else coming into that market, which I do not think would be policy.

21,445. That is to say, if you were closed against all competitors from outside, it is possible that the scheme put forward by Lord Gainford could be adopted by you?—Yes.

21,446. In conclusion, as there is more coal to be worked in those fields than has ever been worked in the past, judged by the geological estimate, the implication is that in order to maintain production or increase it, you have to have a considerable amount of capital for new sinkings and new developments pretty well spread over the whole of these fields?—There are some schemes all ready for development. In fact, in my own case I not only acquired the

minerals but the surface, and in another case I was on the way to sink two collieries in Somerset when war broke out.

21,447. So that being so, if the Miners' Federation, as a national organisation, say that in futuro developments in those coalfields the wages should correspond with the wages of the rest of the coalfield, that would, on your evidence, make it impossible for you to proceed with these developments?—I had started getting things ready again when this war was over, and the moment this application came forward for an increase of 30 per cent. advance in wages and the shortening of hours, I realised if that happened it would be absolutely impossible to work those mines at a profit, and, therefore, I proceeded no further, and nobody could unless something is done if the miners are going to have the same wages in our district that they do in others—no development will take place unless some assistance or some scheme is devised for giving assistance to those districts, if it is felt advisable that such districts should continue.

21,448. *Mr. R. W. Cooper*: How old is your company? How long have you been concerned in it?—Our offer for Bristol collieries was accepted the day war was declared; they were in liquidation.

21,449. So that in point of fact this is a new venture on your part?—It is not a new venture, because the collieries have been in existence for a good many years.

21,450. On your part?—Yes.

21,451. Am I correct in supposing that the difficulty you have been describing to the Commission is due to the advance of wages ordered by the Government recently in consequence of the Interim Report of some of the members of the Commission?—Not only that; the percentage increases that have taken place since 1914, where we have had to pay the same increases as everybody else, increased minimum wage, and then on top of that the war wage of 3s. a day, and the Sankey wage.

21,452. What was your position up to the end of last year?—We were making a profit, as a district.

21,453. About how much of your production goes to the town of Bristol?—About 60 per cent. of it in Bristol.

21,454. In Bristol I include Clifton?—Yes.

21,455. What proportion of your production goes to the town of Bristol?—Do you mean my production in Bristol?

21,456. Yes, in Bristol first?—The production of the output in Bristol which goes into Bristol itself I should think would be 70 or 80 per cent.

21,457. About what is the cost of delivery per ton from your pit to your buyers in Bristol. Is it 1s. 6d.—It would be more than that when we have to deliver and carry the coal into cellars, which we do.

21,458. What coals compete with you in that particular trade in Bristol? Have you any serious competition with that trade of yours in the town of Bristol?—Yes, very serious. There is another thing I ought to have mentioned just now; that is that our production of small coal in our district is over 60 per cent., and that coal has to be disposed of. We get a great deal of competition in that 60 per cent. of small coal, especially from South Wales, when they have a market for their large, they are bound to dispose of small or tip it on dump heaps.

21,459. I gather you have made money by it?—Yes, up to the end of 1918.

21,460. Have you a special price given you by the Board of Trade?—No.

21,461. You are aware you can make application for a special price owing to special circumstances?—Yes; in the Forest of Dean a special increased price of 2s. 6d. is allowed.

21,462. Before the Sankey money was awarded have you made any attempt to get a price from the Board of Trade?—We were in touch with the Controller before, and we applied in January to be allowed to increase our price for coal 2s. 6d. per ton in Somerset and Bristol, as the 2s. 6d. had been granted in the Forest of Dean, South Wales and

22 May, 1919.]

COLONEL SIR FRANK BEAUCHAMP, BART.

[Continued.]

Cannock Chaso. The Controller explained to us that he did not think it was the time to advance the prices of coal when the war was over. He thought the men would be coming back and that we should have a much larger output, reducing our cost, and consequently we should find it unnecessary to have that 2s. 6d. per ton. We pressed him not to close the door absolutely and he said he would not close the door. He said, "If you will send me the returns for the quarter January, February and March, I will re-consider the question at the end of March." He has not all the figures he requires yet, but I gather in view of this Commission that is sitting now there is very little likelihood of his giving an increase.

21,463. Is he waiting to receive from you the account for the quarter?—Yes.

21,464. Is he waiting to receive from you the first quarter of this year to show the result of the quarter?—Yes.

21,465. I suppose when you complete those accounts, you will include as part of your expenses those additional wages?—We shall still press him to allow us to increase our price of coal.

21,466. I suppose you have a reasonable hope to expect that he will?—Well, we hope he may.

21,467. Of course you are entitled to the benefit of the guarantee under the Coal Control agreement?—Yes.

21,468. As you know, the Government are now proposing to modify that agreement but still maintain a guarantee?—Yes.

Mr. Herbert Smith: Would you ask what were the pre-war profits?

21,469. Mr. R. W. Cooper: I understand you to say that you only really became interested in this company yourself a few days before the declaration of war?—Yes. That is the East Bristol.

21,470. Had the concern up to that time been making or losing money?—The concern as a whole had been losing money. One of the collieries in the concern had been making a profit which was being lost at the other two collieries in consequence of their having antiquated and out-of-date machinery.

21,471. But the result of your coming in shortly before the war was that up to the end of 1918 you had converted what was a loss on the whole concern into a profit; in other words, was not this speculation fairly successful?—Well, we have not been able to pay more than 5 per cent. dividend yet on the capital. Last year we were not able to pay anything at all.

21,472. What sort of reserve have you made?—We have not made any reserve at all except something very small.

21,473. Have you spent anything on the development of the collieries?—We have put a certain amount back into the collieries, because we were electrifying the collieries.

21,474. It is not a question so much of what dividend you declare as what profits you have made?—The accounts for Bristol for the quarter ending 31st December, 1918, show a loss of 1s. 4d. a ton, but we get a small profit, because the Coal Controller pays us the difference between our war wage cost and the 4s. a ton of the selling price.

21,475. That is only one quarter, and if I may say so, one quarter is not a just criterion?—I was going to give the other quarters.

21,476. If you please? Have you a summary of the result of your four years of ownership?—No, not here. I can give you the results for the four quarters for the district.

21,477. What did you do in 1916-17, for example?—I have not those figures here, but for the quarter ending December the loss per ton was 1s. 4.69d. The profit for the half-year ending June, 1918, was 10.95d., and the profit for the quarter ending September, 1918, was 3s. a ton for the district.

21,478. What is the capital of the company?—With regard to the capital of the East Bristol, the actual capital paid up is £25,000, but then, of course, we have debentures.

21,479. £25,000 is the share capital. Do your debentures carry 5 per cent. interest?—5½ per cent.

21,480. Mr. Evan Williams: Before the Control, I suppose you in the Forest of Dean managed to exist and make a profit?—Yes.

21,481. And your difficulties came about through the Control?—I will not say through the Control.

21,482. Well, through the granting of a wage which now amounts to 5s. a day irrespective of the amount of work that is done?—Not entirely, but it is to a large extent due to that. In addition we have had a very large increase in miners' wages throughout the country on their standards, and that, of course, has put up our costs apart from the war wage, and then there is the flat rate of 2s. a day which was granted a little while ago.

21,483. Do you suppose if complete liberty from control is given to you, you will not be in the same condition relatively to the other trades as you were before?—No, I do not think we could be.

21,484. Because you assume the Miners' Federation would ask the same wages?—I think it would be useless to go to the Miners' Federation and say, "We cannot increase our profits; will you allow us to take off 30 or 40 per cent. wages?"

21,485. In the past were the men enjoying as good a standard of life as in other districts?—They did not earn such high wages, but perhaps they did not spend so much. In view of the fact that a large number have been able to build their own houses and buy little bits of land, it seems to show that some of them are fairly comfortably off, but I do not think they had excessive wages.

21,486. To maintain the same standard of living in your district as in other districts a lower wage will suffice, will it not?—I should say a slightly lower wage would.

21,487. So that if the Miners' Federation insists upon the same actual money being paid in your district, it will close it through that demand and nothing else?—You have to remember that the cost of living has gone up to everyone. If it has gone up to the miners in South Wales, it has gone up to the miners in our district.

21,488. Assuming the conditions are the same and the wages are the same, it is because of that that you fear you will not be able to exist?—Yes.

21,489. I believe your district and the Forest of Dean are districts which lend themselves to co-operation among owners more than other districts?—I should think they would.

21,490. I think in the past your machinery was pretty antiquated, taking it altogether, was it not?—I should not call it antiquated now.

21,491. You have improved, and there is a good deal of improvement?—In the last twenty years there has been a very great deal done in improvement.

21,492. Sir Adam Nimmo: Just following on these questions of Mr. Cooper and Mr. Evan Williams, there is one point I wish to get cleared up in my mind, and that is: assuming control to be withdrawn, and assuming a short supply of coal in the country, would your price in your districts not rise to give you a sound economic position?—I do not think it would.

21,493. Where would the difficulty come in?—We do not supply the whole district.

21,494. I understand that you have a market right down the South-West of England which is being supplied from your district just now?—Yes, partly.

21,495. In ordinary times did you have a competitor in either the South Wales coalfields or the North Wales coalfield?—We had competition from South Wales for small coal, and we had competition for large coal in Bristol. For instance, if for argument's sake we say in 1914 our average profit per ton in Somerset was 1s. 6d., if we had a local market where no other competitors could get in, we could have put up that profit to far more than 1s. 6d. a ton.

21,496. Assuming that there is a period in the near future, say when there is a short supply of coal in the

22 May, 1919.]

COLONEL SIR FRANK BEAUCHAMP, BART.

[Continued.]

country, have you anything to fear from the point of view of your price?—Yes. I do not think it is possible for us to put up our price above others. If the coal control were removed to-morrow, I do not think it is possible to put up the price to 4s. or 6s. a ton, as we should have to do over and above our competitors.

21,497. Where would the coal come from to meet the markets, assuming you have a short supply?—Many of the people could not carry on their business if they had to pay 4s. to 6s. more a ton for coal, having regard to the competitors of other districts making similar goods. They could not burn bricks, for instance, at the same price.

21,498. *Mr. R. H. Tawney*: I understand your difficulty is that you have to sell at the same price as your competitors while your working cost is higher?—Yes.

21,499. Is not the gist of your plan that you propose to secure a system of unification so far as the last increase of wages is concerned?—Not the last, but so far as the increase of wages is concerned which has taken place since 1914.

21,500. You really propose a system of partial unification in order to prevent this district going out under special disabilities?—Yes.

21,501. You are not the only district which is worse off than others?—No.

21,502. If it is good for your district, it is good for other districts which are below the average?—In my opinion, it is good for our district and it would be for other districts.

21,503. If, without raising prices, you are to keep the worst districts working satisfactorily, what is required is some scheme of unification. Is that your point?—Yes.

(Adjourned to to-morrow morning at 10.30.)

SECOND STAGE—EIGHTEENTH DAY.

FRIDAY, 23RD MAY, 1919.

PRESENT:

THE HON. MR. JUSTICE SANKEY (*in the Chair*).

MR. ARTHUR BALFOUR.

MR. R. W. COOPER.

SIR ARTHUR DUCKHAM.

MR. FRANK HODGES.

SIR LEO CHIOZZA MONEY.

SIR ADAM NIMMO.

MR. ROBERT SMILLIE.

SIR ALLAN M. SMITH.

MR. HERBERT SMITH.

MR. R. H. TAWNEY.

MR. SIDNEY WEBB.

MR. EVAN WILLIAMS.

SIR ARTHUR LOWES DICKINSON, } (*Assessors*).

SIR RICHARD A. S. REDMAYNE,

MR. ARNOLD D. McNAIR (*Secretary*).MR. GILBERT STONE (*Assistant Secretary*).

MR. WALLACE THORNEYCROFT, Recalled.

21,504. *Mr. Robert Smillie*: May I take it that you agree generally with Lord Gainford's evidence?—Yes.

21,505. On page 8 of your *précis* it says: "The selection of a competent administrative staff. The underground staff is, in fact, always drawn from the colliery workers. Those best educated generally and technically are chosen, and work their way up to the higher positions according to their ability." Has that been your experience at the collieries which you have managed?—Yes.

21,506. That you have endeavoured to choose from the underground workers "those best educated generally and technically"?—Yes.

21,507. Have you ever had any examination, or did you ever suggest any examination, to prove the technical and practical experience and ability of your people who were employed?—No. The best examination is watching their progress in their practical work and conversation with them generally.

21,508. Did you yourself watch the progress of the general work?—Yes.

21,509. In the pit?—Yes.

21,510. This says: "The technical and commercial staff are selected from all classes of the community, but usually have been born and bred in a colliery district." I think I may take it that the most desirable thing in selecting a colliery manager is to get a man of the highest technical and scientific

attainments in mining?—That brings in the conception of the meaning of the word "manager." It depends upon what you call a manager. The manager in our Scottish mines, as you are well aware, has usually over him someone of a much higher technical training than the manager himself, but I quite agree the more technical training the manager can get the better, especially in modern times.

21,511. I should not be prepared to accept your proposition, so far as Scotland is concerned, that the manager of the colliery has usually above him a more highly trained person. Do you insist that that is so?—Yes, broadly speaking.

21,512. Do you know the Coalburn District in Lanarkshire?—I have not been there for 25 years.

21,513. Do you know where it is?—Yes.

21,514. Do you know that there are 14 pits there, comprising four different colliery concerns?—No, I do not know, but I daresay that is so.

21,515. Will you take it from me that there are managers holding first-class certificates in charge of each of those four concerns, and that there is nobody placed above them with higher technical knowledge than they have?—Has not Coltness got a place up yonder?

21,516. No, Coltness has not?—Is not Douglas there?

21,517. No, it is the Coalburn District, not the Douglas District?—Will you give me Auchlochan? Is that one?

23 May, 1919.]

MR. WALLACE THORNEYCROFT.

[Continued.]

21,518. William Burns is one at Auchlochan. Would you say that Auchlochan Collieries has a higher skilled person than the manager of the pits above him to advise?—I do not know the man at Auchlochan, but I rather thought he had.

21,519. Do you know Waddell's place?—No.

21,520. I put it to you that there is a whole district in which the responsibility lies entirely with the acting manager of the colliery?—Probably they have got good men there and do not require some other qualified person.

21,521. Would you come down to the Larkhall District? How many collieries are there which are managed entirely by the manager in charge without the supervision of a person above him?—Has not Sir Adam Nimmo collieries in that district?

21,522. Yes?—Has he not Mr. Gibb over him, a highly technical man?

21,523. There is a technical man above the manager there?—Yes.

21,524. Is there any other colliery you know?—The Summerlee Colliery.

21,525. They have a technical manager highly skilled?—Yes.

21,526. Will you take the Bog Colliery, or the Allantou Colliery?—I am not familiar with that district nowadays.

21,527. However, we need not pursue that. It is not general, I can assure you?—I should say it is still. You have picked out some I do not know anything about. They may have a consulting engineer who pays a great deal of attention to it, but I am sure they have someone.

21,528. They may have a consulting engineer they would see every quarter, but you would not say that is a person in charge?—I know some collieries have a consulting engineer who comes every time when he is wanted.

21,529. You and I have a knowledge of the facts and you differ, and I might perhaps say that I have a wider knowledge than you?—Taking it in proportion to the output, I would say three-quarters of the output of Scotland have a technical man over the manager.

21,530. I put it to you that over your general manager or over your manager holding a first-class certificate at the mines it is well to have a man who is highly skilled technically in mining?—Certainly.

21,531. You would say a person who was highly skilled technically in mining would be a better manager if he had practical experience, other things being equal?—That is one of the most difficult problems we have to contend with in choosing a manager, and to decide exactly (if I may call it so) the specification of the manager—it is a nasty word to use, but it expresses what I mean. If you are choosing a man, you have to pick from the selection that is available the best man you can get for the particular situation, and it depends how much technical knowledge you have, and upon how much technical knowledge is available, how much technical knowledge it is necessary for him to have.

21,532. I would like to put the question again, because you have not tried to answer it. Taking the technical knowledge between two men as being equal, would you prefer a man who had also practical knowledge of mining to be the manager?—Certainly.

21,533. Now that is the question I put to you first. If you had two men or ten men of equal scientific attainments and technical mining knowledge, other things being equal—character and so on—you would choose the man who had practical knowledge?—Yes.

21,534. And if that practical knowledge were gained as a boy or as a young man in practical work, it might be all the better?—That is just where the difficulty comes in. The years he spends as a boy in the pit make it much more difficult for him to attain the necessary standard of technical knowledge.

21,535. I put it to you, the attainments being equal?—These are hypothetical questions which make it extraordinarily difficult to answer fairly.

21,536. Surely that is a fair question. Other things being equal, as to character and technical attainments, you said you would prefer the person

who had practical experience joined with that?—Yes, but whether a man could be in that position is the point.

21,537. Never you mind whether he could be. I say he is?—That is where the hypothesis comes in.

21,538. Do you know how many, roughly speaking, of what are called general managers, or those who really direct the collieries, have had practical experience?—I think most of them have.

21,539. With regard to you yourself, where did you begin your practical experience?—At Merryton Collieries. I was first of all engaged in surveying in Alexander Simpson's office, where I served my apprenticeship.

21,540. Have you had any experience in England at all?—About six or eight months in Staffordshire.

21,541. After you left the office?—No, before.

21,542. Do you call it practical experience being in a surveyor's office and going to the pit from time to time to do a survey?—In my case it certainly was so. Perhaps I had more of a chance than others, being intimately acquainted with a number of head men at the collieries we went to. I used to stay frequently at the various collieries and had the run of the place, and saw the cost sheets and every breakdown and so on. I was particularly fortunate in being able to take full advantage of the system which obtained in Scotland by getting experience as a surveyor.

21,543. Should I be right in putting to you that the law lays it down that that is not a practical experience under the law?—That is where I think the law, perhaps, is rather wrong at present.

21,544. But you must take the law, I suppose?—Yes, but I was speaking of 35 years ago or more.

21,545. So am I. I remember you a long way back. I want to say to you that you yourself were born of what is called a mine-owning family?—That is true.

21,546. And that you never required to do any work to earn your living?—On the contrary, that is not true.

21,547. And you never had any practical work?—It is the contrary.

21,548. Now, I defy you to prove you had any practical work prior to your getting your certificate. I admit you did some surveying, but I take it you did not know much about where to set a prop or to withdraw it, or where to look after your safety, had you been working at the coal face?—There, I think, you are wrong. It is very difficult to argue from such a personal point of view. I have told you before, when I was going round surveying in these different districts, I used to live on the spot instead of travelling backwards and forwards, and to take such particular things as drawing wood out of a stooping-place; in Merryton District many a night I have drawn wood after surveying all day.

21,549. You spent many a night drawing wood?—Yes, along with the fireman at lots of the collieries. Another particular instance I remember quite well is Kilsyth where I used to go regularly for a fortnight or three weeks at a time. There was never a breakdown of any sort or kind at that place of which I was not told, and I used to go to it.

21,550. I remember hearing of a visitor who went down a pit and took a pick at the face and knocked a bit of coal down. He took it home, and he swore he had practical experience?—I think that is an exaggeration.

21,551. But that is your experience, is it not?—No, it is not.

21,552. Those who know you know that?—No, they do not.

21,553. As a matter of fact, the general managers—men in your position—have a right to instruct the local colliery managers as to how to carry on the colliery?—Yes.

21,554. You could not probably do so now, but were you ever in a position to go to the coal face and perform a day's work there?—No.

21,555. Did you ever do any work at the coal face?—No.

21,556. Did you ever do any work in the drawing road in the shape of drawing tubs in and out?—No.

23 May, 1919.]

MR. WALLACE THORNEYCROFT.

[Continued.]

21,557. Did you ever lay any roadways?—Yes.

21,558. Did you ever do any hanging on in the pit bottom?—Yes.

21,559. Well, that adds to your righteousness. I suppose your position, I may take it, is the position of 80 per cent. of the general managers and agents of the coal mines of Great Britain. That is, that not 20 per cent. of the men in high positions have had any practical experience?—I do not agree. I actually acted as a certificated colliery manager for about five years and took the whole responsibility, and was at the pit every morning at six o'clock, and so on.

21,560. I am speaking of practical experience in mining. May I call your attention to that provision: that a person must have five years' practical experience underground, or, if he holds a diploma, two years' experience either at colliery work or in charge of the work?—Yes.

21,561. I want to put it to you—what proportion of the general managers in Scotland, who are at the head of large concerns, have had that practical experience?—I could not put a figure upon it, but I should think by far the greatest majority.

21,562. Let us take some of them. Do you know Mr. David Mowatt, who is probably one of the most highly skilled technical men we have in Scotland?—Yes.

21,563. Are you aware that he had no practical experience?—I am not aware of what he was as a young man. He grew up in the Summerlee Company's office.

21,564. He was in the Summerlee Company's office and acted as a surveyor from a boy upwards and became general manager without any practical work. He surveyed in my place again and again when he was a young man, but he never had any practical work. Mr. David Mowatt is in charge probably of fifteen fairly large collieries in Scotland?—Yes, and very successfully in charge.

21,565. And he has never had any practical experience?—That I do not agree with. It is the definition of practical experience that you and I differ about.

21,566. Surely you will take the practical experience laid down by the Act of Parliament?—By practical experience I take it you mean, actually doing manual work, digging coal at the coal face?

21,567. Yes, or any other class of practical work. I mean a man working for his living?—What I would like to explain to you is that as to boys, a certain number of persons' time is better spent at college, as most do, than pushing hutchies about a pit, if they are capable ultimately of absorbing the knowledge they are being taught.

21,568. Are you aware that to-day two or three or four of probably the most important mining schools and colleges have at their head men who began life as practical working colliers, and were colliers until they were 24 or 26 years old?—If you will give me a name I will endeavour to answer.

21,569. Mr. Daniel Burns, of Glasgow Technical College. Do you know him?—Yes.

21,570. Is that right?—I do not know.

21,571. Did he not spend the first fifteen years of his life in the pit producing coal?—I do not know.

21,572. Do you know Professor George Knox, Treforest, South Wales?—I do not.

21,573. He was a working miner in Ayrshire until he was 24 or 26 years old?—I do not know that.

21,574. Do you know the present head of the Wigan Mining College?—No.

21,575. You admit that those are three important mining schools?—I do not know these schools. The Technical College, Glasgow, I am familiar with.

21,576. I am rather amazed at your ignorance of those things because they ought to be known to every person in your position?—It is impossible to know all the mining schools all over Great Britain. The Technical College, Glasgow, I am thoroughly acquainted with.

21,577. At least you know Daniel Burns?—Yes.

21,578. You have no objection to his knowledge?—I am not going to criticise the Professor of the Technical College.

21,579. At least you could claim for the Technical College, Glasgow, on its mining side that it has been fairly successful in turning out students?—Yes.

21,580. On page 9 of your *précis* you deal with the national coal strike, 1912?—Yes.

21,581. You say that that "was the outcome of a desire to raise permanently the standard of wages in the industry"?—Yes.

21,582. Do you still say that?—That is my opinion.

21,583. Will you tell us what the strike was declared for?—On the subject of failure to agree to raise in Scotland, at any rate, the minimum from 5s. 6d. to 6s.

21,584. You have missed it entirely. That was not the cause of the strike at all. The strike of 1912 was not a strike to secure in Scotland, or any other place, an increase in wage. Is it not amazing that you put that into your *précis* and swear to it?—Just wait a minute.

21,585. The strike of 1912 was the abnormal places strike, and a fight for an individual minimum wage for the men who might be working them?—I have a quotation which I had in my mind from the Conciliation Board proceedings of November 6, 1911, when you stated this, speaking of the minimum wage, when we were discussing the minimum wage in detail in Scotland before the strike took place of course: "I do not think the matter would have been raised had it not been for our failure to get a settlement of the abnormal places question. Some of us said in most cases—95 per cent. of the cases—there were abnormal places or deficient places. These were settled. We are not agreed altogether as to whether that is the proper percentage to put it, but we are all agreed that a very large number of cases of settlement have been effected without the workman troubling either the workmen's agent or even the employers."

21,586. That is true. Now the six weeks' strike of 1912, in which all the miners of Great Britain were idle, was not a strike to secure a higher standard rate of wages?—That is how it appeared to us in Scotland. That was the point.

21,587. You have quoted from that—it was on the abnormal places?—Yes.

21,588. We found workmen working in every part of the country, working all day and every day for a fortnight, and at the end of the fortnight they had only earned half wages. We made up our minds that a man who worked every day and a full day was entitled at the end of a fortnight to get a wage for it. That strike took place for six weeks in 1912 in order to secure to each individual an opportunity of securing wages if he worked for it. Will you take it from me that that was the cause of the strike?—Incidentally it fixed the general wages, and that is what we in Scotland always regarded the strike as being about.

21,589. If you do not believe me, when Sir Adam Nimmo comes to cross-examine you, you cross-examine him, and he will tell you what I say is true. I suppose you have heard the old saying that history repeats itself?—Yes.

21,590. I suppose we may translate that into this. Things occur again and again at different periods in history which are almost the same? That may be a fair translation of it?—Yes.

21,591. Are you aware that an Act of Parliament was passed dealing with miners in Scotland in 1592?—No, I do not remember that.

21,592. Would you admit, from your knowledge of history, that the Scottish miners who lived in that day had not any opportunity to return Members to Parliament?—I do not know that.

21,593. May I take it you are not a student of your country's history?—That has escaped my education, at any rate. I have lost that point.

21,594. I will remind you of the fact that the common people had no voice in the making or unmaking of Parliaments in Scotland in 1592. I suppose you will take that?—The franchise has been altered many times, of course.

21,595. I will read you a quotation from the Act of Parliament passed by the Scots Parliament, composed of landlords entirely, and here is the quotation from the Act of Parliament: "And by reason of the said miners and workers dwelling in hazard of

23 May, 1919.]

MR. WALLACE THORNEYCROFT.

[Continued.]

their lives by the evil air of the said mines and the danger of the falling of the same and other infinite miseries and dangers which daily occur in the said work. Therefore our Sovereign Lord the King, with advice aforesaid, relieves the said miners, metallers and others actively employed at the said work from all taxation, charges, proclamations, and other obligations whatsoever both in peace and war and by the tenor hereof taxable all their servants, families, goods, gear and heritages"—you see the miners at that time had goods, gear and heritages; a most remarkable thing!—"and under his special protection declaring that whosoever wrongs or oppresses, directly or indirectly, them shall have done the same to His Majesty." Do you think that that is a sentimental kind of twaddle? Is that sentimental nonsense?—What is the date?

21,596. 1592?—We were not born then. What the conditions of mining were then I have not the remotest idea.

21,597. No, but this Act of Parliament, which you can get if you care to, will let you know what the conditions were?—I have taken a note of the date.

21,598. In any case this Act of Parliament took them under the King's special care, and any person that injured them should be severely punished as if the act was done against His Majesty. Would you be prepared to agree to the House of Commons passing an Act of Parliament of this kind, so far as the miners of this country are concerned, at the present time?—At the present moment the conditions are absolutely different.

21,599. How do you know that when you said you did not know what the conditions were then?—No, but the conditions of a miner's occupation are, in my view, quite comfortable. If I had to work underground every day I would have no particular objection.

21,600. I am coming to that, and I am coming to your work underground every day. In the meantime, I ask you, would you be prepared, seeing that we have advanced, you think, very considerably, to advise the mineowners of this country to help to get that clause put into a new Mines Act?—No, because I do not think there is any necessity for it.

21,601. That is a bit of what you call sentimental nonsense, is it not?—Yes, I do not think that is an exaggerated statement. I think the idea is largely due to people who go down a pit for one day or two days, like your friend who went and picked a bit of coal off the face and said he was a practical man. If they have to stop there and they are quite unaccustomed to the darkness and so on, they regard it as a very unpleasant job.

21,602. I have not got to the unpleasantness or otherwise of our mines yet. I am dealing with the mines in 1592?—I cannot help you there; I was not there.

21,603. Do you say the people who passed that Act, including His Majesty of that ilk, were guilty of wasting time in passing a lot of sentimental nonsense?—No. I should say if Parliament passed it at that time, Parliament was quite right.

21,604. If it could be proved to you the conditions to-day are as bad as they were in the Scottish mines of that day, would you be then prepared to say that you would try and assist us in getting a clause of this kind put into an Act of Parliament?—On that hypothesis, yes.

21,605. Then we must try to prove it, and you have pledged yourself to assist us if we can prove the fact. Are you aware that an Act of Parliament was passed in 1850 to give the Government power to appoint Inspectors of Mines to go down and examine the mines of this country?—I do not remember the date of the first Act of that sort.

21,606. You are aware there was an Act passed, which was called the first Inspection Act, which gave the Government the right to appoint skilled mining people to go down the mines to inspect the mines. You are aware that there are inspectors now, are you not?—Yes. There was a first Act, but I do not know the date.

Chairman: Mr. Smillie is quite right; it was the Act of 1850.

21,607. *Mr. Robert Smillie:* There was an Act of 1842, which only gave the inspectors the right to

inspect on the surface. The Act of 1850 gave them the right to go underground. (*To the Witness.*) Are you aware that Boyd, in his "History of Mines Inspection," states that a certain noble mine owner of that date said there was a good deal of hypocritical sentiment about the legislation which was passed then?—No.

21,608. You are not aware of that?—No.

21,609. Will you take it from me that if you read Boyd's "History of Mines Inspection" you will find it there?—Yes.

21,610. Is that not like history repeating itself again? There you get it in 1592 first of all?—I do not know whether Boyd was speaking from intimate knowledge or not; I cannot say.

21,611. Boyd was speaking from intimate knowledge, because the statement is put in quotation marks and he quotes all the statements made by mineowners and their representatives in the House of Commons in their opposition to any mining legislation and to the taking of the children and women out of the mines. This gentleman of whom I spoke said there was a good deal of hypocritical sentiment about this. Are you aware that one of the Bishops in the same House (the House of Lords) called upon him to withdraw that statement of hypocritical sentiment referring to the mining legislation which had been passed?—No.

21,612. Here we find Mr. Wallace Thorneycroft in the witness chair now telling us that because we are asking for the nationalisation of mines to improve the condition of the mine workers, there is a good deal of sentimental nonsense. That is what is being said, and you still stick to that, I suppose?—Yes.

21,613. I suppose you sometimes in your busy life get a holiday?—Yes.

21,614. Do you ever get a holiday?—Yes.

21,615. Well, you are very lucky, but you do get a holiday?—Yes, I am rather short of one now.

21,616. And you do not take a holiday unless you feel worn out, I suppose?—Yes.

21,617. It is when you are fagged that you want to play golf or shoot or enjoy some of the amusements of the working miners?—Yes.

21,618. You take a rest?

Sir L. Chiozza Money: He goes down a coalmine.

21,619. *Mr. Robert Smillie:* I was going to ask, in view of the splendid healthy condition of the coalminers, whether or not you spent your holiday in one of your own or anybody else's coal pits?—In point of fact that is a thing I often get chaffed about. When I am on a holiday, if there is a mine in the country, I am very often down it.

21,620. If there is a mine in the country?—Yes. In Cumberland or Algeria or anywhere else where I go, my wife, among other people, always chaffs me, because I cannot keep away from it and I go down it.

21,621. Why do you go to Algeria to go down a mine when you have mines of your own in this country?—Variety is a great attraction.

21,622. *Mr. Cooper,* one of our comrades on the Commission, when he gets a holiday, goes home and works at his books. I would expect you and he believe it is a nice healthy employment and recreation doing work. I thought you would have chosen one of those healthy mines as a sanatorium, and would have rested there to recuperate, but you do not?—No, but I put it like this again: A certain person had a son. The son was ordered by the medical adviser to have six months' fresh air and exercise before he went to college. The father sent him down a mine as being a place where he would get fresh air and exercise, and the result was successful.

21,623. I knew a man who had two sons, and both took the whooping cough, and when they were just about to recover the doctor said a change of air would help them considerably, and if he took them down a coal pit it would make them all right, and it did. That proves the healthy state under which the miners live. Did you hear Mr. Herbert Smith put it to some witness as to what the temperatures of some of the mines were?—Yes.

21,624. Did you hear him say, and the witness admit, that sometimes it is as high as 90 degrees?—I do not remember the temperature he put it at.

23 May, 1919.]

MR. WALLACE THORNEYCROFT.

[Continued.]

21,625. Did you hear him say that 80 degrees and 85 degrees are not an uncommon thing?—If he said so, I will accept it.

21,626. Did you hear a colleague of your own admit that where it is 90 degrees or 85 degrees—a state of matters in many Yorkshire collieries—that a person loses 25 per cent. of his energy and strength when he goes down to work there?—I am quite familiar with that, and in fact during the period I was President of the Institution of Mining Engineers, we instituted an enquiry into the question of high temperatures underground to see what could be done to alleviate the position. We all recognised that to work at that high temperature is a difficult thing, and I do not think we can expect a man working at that temperature to do as much work as he does working in a temperature of 65 degrees or 70 degrees. I do not think it is possible. It is a scientific fact, I believe, and that is just the case where the mineowners have initiated investigation on the subject, and have been putting the best brains they can together to find out how to alleviate that difficulty.

21,627. You secure all that from theory, I suppose, and not practice. Have you had a try at working at 90 degrees for 8 hours a day?—In point of fact I spent some time down one of those Yorkshire pits not very long ago.

21,628. Which was that?—Maltby.

21,629. Are you aware that in some parts of the Continent at a certain temperature, 80 or 85 degrees, the hours are only to be six hours a day?—No, I do not know what arrangements are made to that effect.

21,630. Do you know there is a difference in the length of hours because of the temperature?—No.

21,631. You say the fact that a person coming out of the pit black with coal dust does not indicate at all that mining is an unhealthy occupation?—I do.

21,632. Have you ever seen, preserved in the Edinburgh Infirmary what is called “the miner’s lung”?—No.

21,633. You will find the lungs of a miner there preserved in a bottle, and you will be told the professors found they were just like a piece of coal?—Dr. Haldane is an authority that I depend upon about the health of the miners.

21,634. Would you care to breathe coal dust all day yourself for the fun of the thing?—I often have and I have suffered no ill-effect.

21,635. Do you like it? Would you rather breathe coal dust or pure air?—I would rather breathe coal dust than have consumption.

21,636. Would you rather breathe coal dust or pure air?—I should like to have a variety, the same as other people, but the fact of the coal dust being in the mines and entering into people’s lungs, according to Dr. Haldane, who is my authority, is not dangerous to their health.

21,637. What side was Dr. Haldane speaking on at the time?—Dr. Haldane takes no side.

21,638. Does he take no side?—No, I do not think so.

21,639. Yes, he takes sides. Sometimes he is on the Government side and sometimes against them?—Nothing will induce me to say that Dr. Haldane is not a man of absolute integrity to tell the truth, the whole truth and nothing but the truth.

21,640. I take it that Dr. Haldane’s position has chiefly been that coal dust is not nearly so bad for a miner’s lungs as silica dust or metalliferous mine dust, but I do not think Dr. Haldane or any other scientist in the world would prefer having his own lungs filled with coal dust or seeing other people’s lungs filled with coal dust for the good of their health and the salvation of their souls?—One of the suggestions which, I believe, is being tried in practice is to put coal dust down the mines of South Africa which are bad from silicious dust in order to mix the silicious dust with a large quantity of coal dust, in the hope that that will cure the danger of phthisis from the silicious matter. They are actually increasing the dust as a preventive for the disease.

21,641. Do you know the danger of phthisis arises from the silica in the dust being sharp-edged and cutting its way into the lungs when it gets into the lungs?—I am not quite sure of that.

21,642. And coal dust is said to dissolve and not to cut into the lungs?—My conception of what Dr. Haldane’s paper told us was that the coal dust going into the lungs has some property that causes the particles to act as little scavengers and for the lungs to throw off the coal dust and along with the coal dust throw off any other deleterious matter that happened to be in the lungs.

21,643. But, still, he advocates that the mines should be ventilated in such a way as to carry off, as far as possible, the coal dust from the men who are working at the face?—I do not think the ventilation carries off the dust. I rather think a strong ventilation creates dust.

21,644. It carries it off from the men at the face?—It keeps it in the air current. I do not think strong ventilation is a prevention of dust, but rather the reverse.

21,645. The deep pits are usually drier from the point of view, not of moisture in the air, but drier from the point of view of water running on the men?—Yes.

21,646. While the temperature may be higher, there is less inconvenience from roof and side water. I want to take you to some of the shallow pits you have in Scotland, where the seam may be 18 inches, 2 feet or 3 feet thick. Have you known of cases in which miners were working all day long on their side and the cold water running down from the roof on them?—Yes, I am quite familiar with the wet places.

21,647. Have you known of miners working in a place where there were 3, 4, or 5 inches of water lying all day?—Yes.

21,648. Have you known of them coming out of the working places wet from head to foot with the water of the mine?—I have known them coming out of the places very wet.

21,649. Is that a very healthy thing?—Of itself I do not think it does any harm as long as the miner gets home fairly quickly and does not have to stand about in his wet clothes outside.

21,650. Supposing a miner comes up in that state in cold weather, and half an hour afterwards he gets into the workmen’s train—which, generally speaking, is open boxes—and then travels 10 miles to Lanark and then walks two miles from Lanark to his home, is that a healthy thing?—No.

21,651. Would you make any arrangements to prevent his carrying the water in his clothes?—Yes, I would say that should be prevented.

21,652. There should be something done to make it possible for him to change at the pit bank and not go home in wet clothes?—If that is the condition, which I do not know, I am rather surprised the men do that.

21,653. Sixty per cent. of the miners in the Coalburn district travel by train for six, eight, and ten miles to work?—Are sixty per cent. of the places wet?

21,654. No, sixty per cent. of the places are not wet, but ninety per cent. of the men, the colliers, come out of the pit either wet with the water of the pit, or their clothes wet through with sweat. You are aware of that, are you not?—Yes.

21,655. If they are wet through with sweat, they are almost as likely to take cold as if wet through with moisture?—Unless they have a top coat to put on. I am sure they probably take care to protect themselves in some way. That is a very outside place, and I am quite sure, without knowing that those are the conditions, those men have to be paid very highly and above the average to do it.

21,656. Well, they object to take a motor coat or a fur coat with them to the pit, and they leave it at home. You have, at least, seen men working if you have never worked yourself. Do you think that many men on the surface work in the same way that a collier works when he is under-cutting or side-cutting his coal underground?—Do you mean comparing it with other industries?

21,657. I really compare it with the vast majority of industries. Take a stoker on board a ship, or a trimmer on board a ship, or a blacksmith in a country shop. Do they not work a great deal harder and do more physical, hard work than the ordinary rank

23 May, 1919.]

MR. WALLACE THORNEYCROFT.

[Continued.]

and file of the workers on the surface?—You mean the first-class collier working at the face?

21,653. Yes.—I should say he is one of the best physical workers we have.

21,659. You are aware where they have to do their holing or side-cutting, that practically every muscle in their body is fully developed and almost as hard as wood?—Yes.

21,660. That is caused by extra strain at all times on them during the six, seven or eight hours they are at work. Does that not prove pretty hard exertion?—Undoubtedly, generally speaking, the collier is in the pink of condition.

21,661. When they are working, doing the kind of work you and I are speaking about now, they are usually breathing very rapidly because they get out of breath and breathe rapidly?—Yes. It depends upon his fitness, and if a man is not over-exerting himself. That is a question of how much often they breathe and I cannot say.

21,662. I put it to you that if a man runs a mile in 4 minutes 20 seconds he cannot consider very much how quickly or slowly he should breathe, but he has to breathe as quickly as he can?—Yes.

21,663. And it is the same with the miners at the coal face?—It is a question of degree.

21,664. He is not breathing in the atmosphere of the surface but he is breathing the atmosphere of the mine whatever it may be for the time being?—Generally speaking I maintain the atmosphere of the mine nowadays is extraordinarily good.

21,665. I am glad to hear that. I have not been down for a few months, but I will go down now.—I will take you a trip if you like.

21,666. I take it you are really as anxious as we are to improve the standard and status of the miners?—Certainly.

21,667. And you are here to give your evidence against nationalisation because you believe it would not improve the miners' status nor improve his conditions, but probably rather injure his position, and also the position of the nation?—That is my firm and honest opinion.

21,668. Could you not do that without minimising or exaggerating as to the work and conditions of the miners? Do you not think you have exaggerated a bit when you want to get this Commission—some of them you cannot mislead even if you tried and I am not saying you would try—to believe the conditions are not so bad. Do you not think it is unfair to minimise really the hardships of the working miner, and the hard laborious nature of his work, and the conditions by which he is surrounded underground? I want to take you to his home. You do not think his home conditions, generally speaking, are altogether all that can be desired?—Let me answer the first part of your question first, because it was rather a long question. You asked me, could I not have given evidence without exaggerating? I do not know that I have exaggerated, but I cannot help being a little combative, I admit, owing to the statements that have been made on your side of the table which have been pretty severe on some of us at times and I am bound to retaliate a little bit.

21,669. You know a great deal about the home life of the miner. May I take it that you admit from your long experience of various counties in Scotland, that the miner's wife is a fairly careful thrifty woman who does her best?—There is just as much difference between the thrift and so on of the miners and their wives as any other section of the population.

21,670. I suppose you say on the average they are quite as thrifty and clean as the average woman of any class, even of the aristocratic class?—It is an impossible question to answer. Undoubtedly, in a great number of cases it is the reverse, and at the same time I am only too pleased to say in defence of the miners and their wives that they are as good members of society as anybody else.

21,671. When you take into consideration the miner's wife has to clean herself and her family, and the wives of the wealthy people get somebody else to clean them, you think under those circumstances

they are good?—I would like to see all the ones that are below the average brought up to the best.

21,672. I want to find out whether you consider the miners' wives in the mass who are, generally speaking, thrifty handlers and cruel drudges, are doing their best under the circumstances to keep their homes as decent as possible. A man in your position ought to give a direct answer to that question?—Some of them undoubtedly are, some of them are not.

21,673. If that is as far as you can go, I shall have to take it at that. I suppose you do not often visit the homes of the miners?—Constantly in the past, when one was responsible for the going into more details that I have done for the last few years, I used to visit the houses and see that they were kept in proper repair. It was part of my regular routine for many years.

21,674. I suppose you know the Ayrshire houses: the mining row of Ayrshire?—Not intimately. I do not often go to Ayrshire.

21,675. That was your early home, was it not?—No.

21,676. You know a good many of the Lanarkshire houses?—Yes, Lanarkshire, more especially Stirlingshire.

21,677. May I take it the houses are rather better than the average in Stirlingshire than in Lanarkshire?—The newer districts of Stirlingshire, I would say, are no better than the new districts in Lanarkshire. There are some very bad old houses in both districts.

21,678. The old houses in Lanarkshire are worse than the old houses in Stirlingshire. Do you think there is any hope of improving the home life condition of the miners apart from their doing their best to improve their home life. Do you think anything can be done from outside to help them?—I think a great deal is being done. What more could be done we are only too willing and anxious to assist with.

21,679. Can you tell me where a great deal is being done?—You were speaking about the washing, and so forth, a while ago. I am told—I have not seen it myself, but one of my friends has told me—that William Baird & Co.'s washing arrangements at a village in Ayrshire are exceedingly successful, and one of the things we should take advantage of and copy in other districts, following the lead of an experiment that has proved successful.

21,680. Is that in the pit in Ayrshire?—I cannot tell you the name of the place.

21,681. They have recently sunk a deep pit in Ayrshire?—It is one of the new villages somewhere near Ayr. It is a new idea providing washing places, and so forth, with hot water, and all the rest of it, and I am told it is popular and successful. Other things have been tried that were not successful of the same sort. When one finds a successful one I think you will find most of the owners quite willing to adopt it. Obviously the more contented the people are you are working with the more pleasant it is to carry on your work.

21,682. If I told you that nearly five years ago the miners in a colliery in Lanarkshire requested the employers to erect baths and the employers requested me to ask them to leave it over until the war was finished because they could not get the material or men, and the men left it over at my request, and they now ask again and it has been refused, do you think that is altogether playing the game?—I do not know the full details. I would like to hear the other side before committing myself one way or the other.

21,683. Do you say the relations between the workmen and employers have been good or bad in the past? On page 11 you deal with the question of types of grievances; the grievances of suffering and the grievances of strategy. Your opinion is that the present movement is a strategic grievance and not one of substance. What is the present grievance?—My conception is the demand made for 30 per cent. increase of wages and reduction of hours to six and for nationalisation of the mines all at one gulp was an extravagant demand chiefly directed to nationalisation.

21,684. Did you object to the men's demands chiefly because they were in one gulp, as you call it, because

23 May, 1919.]

MR. WALLACE THORNEYCROFT.

[Continued.]

we wanted you to swallow the whole thing at once? Is it because too many things are put forward together and we want nationalisation, and the mine-owners to swallow it at once; is that why you say it is strategic? Will you concede them if they are put forward singly?—I have realised for quite a long time that your ideal was to get nationalisation of mines. You think nationalisation of mines is the right thing. We think it is not. We are both probably quite conscientious, and I am sure we are both conscientiously holding our opinions strongly. The reason I say it is strategic is, in my opinion, the putting forward of this what I call extravagant demand at this time when the nation is very short of coal, and it was a strategic moment to get your ideal.

21,685. My idea is not a matter one way or the other. It is the minors' idea that matters, not mine. I want to put it again. You say it is strategy, and that the increase of wages and shorter hours of labour is not really the thing we want, but to so arouse the nation and take advantage of the nation's weakness to secure something we have been thinking of for some time; that is to say, there is no real reason for this movement, only to satisfy the people who desire nationalisation?—I say there was no real reason as regards the cost of living for demanding 30 per cent. advance in wages.

21,686. What about the hours?—When the country was so obviously short of coal, as it was, and as the demand for shorter hours from, call it, 40 to 43 hours a week, which was about what was being worked on the average by the miners at present, to 35 hours a week or thereabouts, or whatever it works out at, I do not think that was a right thing to demand when the country was so short of coal.

21,687. I will allow that to pass and take it for granted your statement is correct. It is not correct. It was a claim for 48—it was a claim they should come from 53 or 54 hours down to about 48. That makes it far less unreasonable that your figures, of course, which I believe are intended to be taken as a correct thing. You say the relationship between the men and the mineowners was reasonably good on the whole. Do you blame the miners or their leaders for all the trouble that has taken place from time to time?—No. There are faults on both sides.

21,688. Do you remember a strike at your colliery for which to some extent I was responsible, when your manager refused to come down off the pit bank to speak to a deputation?—When was that; what sort of date was that?

21,689. About half-way between the time you took it over and the time you left it. You will remember I went with a deputation in the morning and stopped the men and told the men to keep themselves prepared to go to work. We went to the office; the manager was not there; I heard he was at the pit head; I sent up and asked him to speak to us; he said "No; we had struck for some wages"; and when you came in and heard the facts of it you put a stop to it. Mr. Livingstone was the manager's name?—I do not think that was the cause of that trouble.

21,690. The cause of the meeting being held was a question of deduction?—Yes.

21,691. The cause of the strike was your manager refusing to come down to speak to a deputation. Do you justify that?—That is one of the most difficult things to do. If a man makes a mistake to have to put him right is a very difficult thing. I am glad to hear you say I did it.

21,692. I was only putting it to you the fault was not on the side of the miners or their leaders for all the trouble that has taken place from time to time. I think you are of opinion, and your friends are of opinion, that the miners have not yet reached a sufficient stage of development from their slavery in the past to undertake any responsibility in the management of the industry in which their lives are invested. That is your fear?—Not quite that. Perhaps we are going too quickly. If you refer to the scheme put forward by Lord Gainford—

21,693. I am coming to the scheme afterwards?—Then we might deal with that question when we get there.

21,694. On page 12 you say that the private owners of mines, the private capitalism of the owners of mines, has taken risks that no Government department would take in mining, which is one of the most speculative of industries, or any other industry. Is that your opinion?—Yes.

21,695. Have you ever heard of the Government boring for oil in Derbyshire?—Yes.

21,696. Do you expect they are going to get it?—No, I do not.

21,697. Are there many mining men highly skilled who expect they are going to get oil in Derbyshire. Do you know?—I am quite familiar with the discussion on the question.

21,698. Is the general opinion of scientific men they are not going to get oil there?—That is true.

21,699. Unless they go through to the Australian side, and they might get it there. Is not the Government risking some money there?—I do not know who is risking the money there. I am not just familiar with the position. I am not sure that was done with the consent of Parliament.

21,700. Do you know you are amazingly innocent of things?—Can you tell me who is risking the money there?

21,701. It is generally understood it is the Government. Do you think private enterprise is risking the money?—That is my impression.

21,702. I will leave you of that opinion. At the foot of paragraph 12 you say many socialistic opponents to the system of private ownership hold that to save any money out of wages earned is wrong in principle and should be discouraged, and so on. Let us know some of the many socialists to whom you refer. I am a socialist, and I save any amount of money?—I am glad to hear it.

21,703. Thousands and thousands of pounds I save for a rainy day and old age. Do you think I believe that a person should not save money out of his wages and should look to the State in their old age?—I never said you did. It is quite common in conversation with the workmen, and I have often come across them saying they were not going to save any money out of wages. That is what they have been taught. I cannot give you the names of the authors of that doctrine. I should be surprised to be told that has not been preached.

21,704. You cannot give any socialistic writer, well-known or otherwise, that has advocated that people should not save any of their earnings, but should look forward to the State supporting them in their old age?—I have come across, frankly, the result of those writings constantly in talking to people.

21,705. Do you remember any of the working people who said they were not going to save any money and are waiting for the State to take them over in their old age?—I have heard plenty say they would not save, certainly.

21,706. Did you ever hear any say they could not save?—Not recently.

21,707. Would you take it the position of the orthodox socialist is a workman should not save until he has first made sure that his wife and children are properly fed and clothed; that it would be a crime to save at the expense of the children? Do you think that is a wrong doctrine to preach?—Certainly, the children must be fed and clothed first. That is human nature.

21,708. Do you think it is a right doctrine to preach to workmen that they have no right to save until their children are provided for with food, clothing, house and education? Is it a crime to advocate that?—It is a question rather of degree. Certainly, the children should be clothed and properly fed to keep them in good health. That is the primary object of every married man in his life.

21,709. And it is the duty of the father to provide the wages, if he can do it?—Yes.

21,710. And would it not be wrong for him or his wife to save if their saving scrimped food and clothing?—If they were not maintained in good health, yes.

21,711. You would advocate that, in those circumstances, it would be wrong to save?—I am not sure not to save any money.

23 May, 1919.]

MR. WALLACE THORNEYCROFT.

[Continued.]

21,712. I want you to say it now. You have answered me that it would be wrong if the children at home were not receiving sufficient food and clothing and proper housing because the parents were saving. You say that would be wrong. That was your answer. Then a thing that you believe to be wrong you have sufficient courage, I know, to advocate against?—Yes.

21,713. Consequently, you would become, if necessary, an agitator to go down and tell the people they were not to save from their wages under those circumstances?—That is not the point I have there.

21,714. You have placed yourself, for the moment, on the Socialist platform, as far as that is concerned. I am very glad to have you as a recruit. When you speak of saving, of course, if the working classes were all wise and thrifty and saved, they would all become capitalists and invest their money in mines, or some other things, and there would come a time when nobody would have to work because they all would be capitalists living on each other. For a long time it has become quite impossible for the workers, generally, to save?—No.

21,715. I put it to you, which, I think, can be proved in figures, that the average wage of the adult mine worker prior to the war was under 30s. a week?—I do not think that is right.

21,716. Be careful and think the matter out before you give an answer. I say the average wage of the adult mine worker of every grade?—It depends upon what period you take, of course.

21,717. I will take a period of five years before the war?—In Scotland?

21,718. I will take a period of 40 years before the war. The average wage of the adult mine worker above and below ground was under 30s. a week for 40 years. I am not now meaning the coal getters; I mean the adult mine worker. If that were true—do not take it from me until you go into the figures—is there very much opportunity to save, especially where there is a family?—It depends upon the price of living. Many people have brought up families perfectly healthy and comfortably dressed on 30s. a week. Lots of them have done it.

21,719. I have heard of some wealthy mine owner being proud of the fact that his father never had more than 18s. a week all his life. That is not the point. I put it to you 30s., and at the present time I think it would take about 30s. to get your dinner at the Ritz; but 30s. for a family does not leave a very large margin. Supposing they save 10s. a week of the 30s., it would not be a very big annual saving?—It is astonishing how it grows when once you begin to save.

21,720. When it gets to £40,000 or £50,000 it is astonishing how it grows. £25 a year will not increase very rapidly?—Do you remember the roadman that used to be on the road between Hamilton and Larkhall? Scott was his name. He never had much wage, but he had a good eye for a heast and he used to buy a heast out of savings in the first instance, and he died, comparatively speaking, a wealthy man. He used his intelligence, and that is where private enterprise came in. He had at least two sons set up in farms.

21,721. He became a horse dealer for a time?—Yes.

21,722. Do you know what the public opinion generally is of a horse dealer?—There are lots of good horse dealers.

21,723. You keep your eye upon them when you are buying horses from horse dealers, I am sure. I want you to reconsider your statement on thrift. It is only to the miners you teach or urge thrift. Do you ever try that on your wealthy friends?—I am not in the habit of lecturing anybody; but this is a peculiarly novel occasion. I am asked to give my opinion on all sorts of things.

21,724. I do not think you are asked to give your opinion on thrift. That was a question not put to you?—I think it is very material to the argument.

21,725. You were not requested to give your opinion on thrift or your idea of Socialists, although you became a Socialist to-day yourself. With regard

to the scheme which the employers are putting forward here, which, I think, is contained in the last two or three pages of Lord Gainford's proof, are they satisfied that the past and present state of the mining industry is all it should be?—In the main the past history of the mining industry certainly has provided all the coal that the nation required. There have been disabilities, no doubt, in connection with the acquiring leases and so forth, which usually, in my experience, come back and hit the lessors themselves if they are unreasonable. There have been cases no doubt, where lessors have been obstructive, and the scheme that is suggested gets over that type of difficulty.

21,726. Do you think the mine owners of Great Britain and the shareholders in the mines in Great Britain were producing coal for the use of the nation and the nation's good, or was their object the production of coal for profit?—The object of private enterprise no doubt is consistent with the laws for the time being to make the best economical use of the mines as of everything else, and make as much money out of them as possible.

21,727. As a matter of fact, there never was a mine sunk in this country from the beginning of mining to the present time that anybody professed was sunk in the interests of the nation. Did you ever hear a mine owner confess he sunk a pit because of the nation's need of coal?—I think every pit is sunk because of the nation's need of coal.

21,728. Is it not a speculation with the hope of return on the invested capital? Is it because the mine owner thinks the nation needs coal or that there will be an extension of the demand for coal that he goes on sinking pits?—It is the extension of the demand for coal that causes and makes it practicable to sink new pits.

21,729. Is it the extension of the hope for extension in the demand for coal that leads them to sink pits in the belief that that demand for coal will give them a high return on their capital?—Obviously. Money is sunk in a pit with the intention of making a profit.

21,730. If the nation could produce its own mineral wealth—if one dare call coal of this country your own—for its own use as well as private enterprise is doing it for the purpose of making money out of it, do not you think it would be wise of the nation to do it?—That is a big "if". I do not think it could do that.

21,731. I do not ask your opinion whether they could or not. If they could do it, would it be wrong to do that?—I think it would.

21,732. Then I need not trouble you about whether you think they could or not. It would be wrong?—Yes, I think so.

21,733. I am glad you gave that answer. That is the straightest answer we have had yet. If you think that the nation could produce its own coal from this country for its own use as well as private enterprise you think it would be wrong?—Yes, for the reason that private enterprise develops the best of the nation, and I believe under nationalisation the nation would deteriorate.

21,734. Your answer is this, that if the nation could do it as well as private enterprise had, or would do it, it would still be wrong for the nation to do it?—Yes, for the reason I gave.

21,735. For what reason?—The reason that under nationalisation I think the nation would deteriorate.

21,736. The nation would deteriorate?—Yes.

21,737. The physique of the people of the nation?—No, the enterprise and the progress of the nation would deteriorate under a system of nationalisation.

21,738. I am glad you say the nation could not do it. Supposing it could do it as well as private enterprise, would you settle a minimum wage under your proposed scheme for mine workers all over the country?—I would apply the principle of the Minimum Wage Act and apply it over the whole country, yes.

21,739. What Minimum Wage Act?—The Minimum Wage Act settled an immense variety of rates of wages all over the country, suited to the different customs in each district.

23 May, 1919.]

MR. WALLACE THORNEYCROFT.

[Continued.]

21,740. Do not you know that what the Minimum Wage Act settled, or the Chairman set up in the various districts under the Minimum Wage Act—they only settled the rate of wages in different grades which the employers were bound to pay and if the workmen could not earn wages at the ordinary piece price; that was all?—No; the Minimum Wage Act settled the wage of every shift man and everything else.

21,741. It laid down a certain amount of wage which must be paid to certain grades of workers; and, in the case of piece workers, which must be paid to piece workers if they could not earn wages at their ton rate price?—I have the Minimum Wage Act and the Scottish Award in my hand.

21,742. Read out the Scotch Award?—It fixed coal miners at 5s. 10d., fillers, drawers, working controllers, machine conveyors, and so on, at not less than 5s. 10d.

21,743. At 5s. 10d. a day?—Yes, in 1911.

21,744. Is that what you propose under your proposal to set up as a minimum wage?—No.

21,745. What is your minimum wage which you would aim at?—That I suggest must be fixed by some independent authority, independent of both your organisation and ours. For the sake of argument, I take this minimum rates of wages as fixed all over the country in 1912; add 100 per cent. to them, if you like, if economic conditions will stand that rate, make that the minimum wage, but let it be done in conformity with every other industry in the country at the same time. I understand the principle of the minimum wage has been agreed to by Mr. Lloyd George and other politicians on the advice of the Industrial Council. I do not object to the principle, but I do think in the interests of not only the employers, but the workmen, it is absolutely necessary that the relations between the different classes of work in the different industries should be maintained as to the rates of wages, more or less. Therefore, we suggest that some quite independent authority who fixes the minimum wage for all industries should fix the minimum wage for the coal industry also.

21,746. How would you secure an independent authority?—That is what the Industrial Conference is working at. I do not know how they propose to do it, and I do not propose to venture on making suggestions, as it is *sub judice* with that body.

21,747. I am not dealing with the Industrial Council, but the mine owners of Great Britain. Neither the mine owners nor the miners are parties to the Industrial Council or are going to be parties to the Industrial Council. I want to know how you propose to fix it?—There will be some independent authority set up by Parliament in some shape or form independent of you and me.

21,748. How would you choose them independently?—I do not think that is such a difficult thing as was suggested. Last night I heard Mr. Hodges speak about that. I do not think it is right to say there are no men of independent judgment that could look at a broad question in the interests of both employer and workman too.

21,749. If you do set up machinery of that kind would you be prepared to choose from a panel, one half of which was selected by the workmen, the other half by the employers and select from the panel the person to decide any difficulty that might arise?—In this particular question I would like to see certainly one half of the body settling this question working men not only in the mining industry but any other industry, and one half should be employers, or something of that sort.

21,750. You fail to grasp the question I put to you?—I have not finished yet. We are searching for some solution; honestly trying to propose something that will settle some of the miners' difficulties that we have to face. On the question of the minimum wage the main factor to be considered is the economic conditions of the country at the time; what is the maximum wage that industry can afford to pay, not only our industry, but every industry. It is our desire not to run that wago down to the bottom; our interest, indeed, is the other way. As a coalowner, my interests are not to pay a low

minimum wage at all; my interest *qua* coalowner is to have a high minimum wage.

21,751. I will put the question again. Supposing that you had a Joint Board of Workmen and Employers, taking it for granted your scheme is in force and that the wages question is to be settled, and you have a Joint Board, half working representatives and half employers, and you fail to settle, you say there ought to be an independent person employed?—No; pardon me, you have picked it up wrongly. It is an independent authority dealing with broad facts. It must have under review all the statistics and economic conditions of the country; one particular feature of this scheme is that there will be the cost and profits as well as the selling prices in the hands of the Mines Department that we suggest should be created, and from that information, as well as similar information from other industries, it will be very much simpler in the future to gauge the level at which wages could be fixed without economic disaster to the country. Your point is, if there was to be a panel and one man to be the final arbiter, would I accept a working man as that arbiter?

21,752. I never said so?—I thought that was your point.

21,753. I said in the event of that point, the wages having to be settled by an independent person, would you accept one drawn from a panel on which the workman selected one half of the panel, the employers selected the other half. Would you be prepared to have one drawn from that panel?—To settle a question like the broad minimum wage?

21,754. Yes.—For the whole country?

21,755. Not for the whole country, for the miners of the whole country?—That is where we are at cross purposes. Our scheme is the minimum wage should be fixed not by the mine owners and the mine workers.

21,755a. We need not trouble about that. We are not there, and we are not going there. With regard to the miners and the mine owners, if there was any scheme mutually agreed between them, would you be prepared to have drawn from a panel, half of which was put forward by each side, a man to settle any differences on the wage question?—That is the point I put to you.

Chairman: Drawn by lots?

21,756. Mr. Robert Smillie: Or drawn time about?—No, I do not know I would, unless both parties had some right in the selection of the panel.

21,757. Each party would have their full right in selecting their own share of the panel?

Chairman: Each selecting half of the panel.

Mr. Robert Smillie: Would you be prepared to say that one drawn by lot from the panel should be entitled to settle?

Mr. Arthur Balfour: Selecting a member really from the panel?

21,758. Mr. Robert Smillie: Yes, by lot.—A great deal depends upon the class of question. That is compulsory arbitration. Neither will agree to compulsory arbitration.

21,759. It is not compulsory arbitration if you agree to a thing. It is compulsory settlement of a difference, providing you first agree. We have compulsory arbitration in Scotland for the mining wages under our Conciliation Board, but we agree in the event of a difference to call in a third party?—When you come to the appointment of a man to be an independent chairman of a Conciliation Board I would not object to working men being on the panel, but I think to get satisfactory decisions both parties must agree to the independent chairman they select for that particular question. I would not object to have the opportunity to take a working man's representative for such a job, but to say distinctly that I would accept any man that any Trade Union put up on to this panel is more than I can do. I want to know who those men are first, just as you want to know who the employers' side are.

21,760. We do not care a rap who the employers' side are?—In the past that has not been our experience.

21,761. We have put forward Mr. George Barnes, who the Government thought good enough to be a member of the War Cabinet. Your people refused him?—When?

23 May, 1919.]

MR. WALLACE THORNEYCROFT.

[Continued.]

21,762. We proposed him as a mutual Chairman. They would not have him?—What date?

21,763. Five or six years ago. Good Lord, he has not become more respectable since then?—He has become more experienced.

21,764. It is knowledge?—Both sides want to have confidence in the Arbitrator before there can be success.

21,765. His name was put before your people and they would not have him?—I am pretty sure from what we know now, Mr. Barnes being more prominently in front of us, I would say yes.

21,766. We would not put him forward now?—That is just the difficulty. You must know the man. It is the man that matters, not what he is.

21,767. The importance is what is your proposal. You may leave the Industrial Council out of your mind. I take it your scheme is to settle the wages of the miners? If your scheme is to settle the wages of the miners would you settle a minimum wage nationally, and apply the same minimum to all of the miners in the different parts of the country?—I do not think that is possible, because the customs and habits of each of the different districts are so different. I do not think it is possible to settle a question of this sort except in districts.

21,768. How would you have your districts?—I would like to stick to the districts laid down by the Minimum Wage Act, and take as the basis the wages that were fixed in 1912, add whatever percentage you like to them, possibly all over the country—the same percentage might be applicable all over the country. That I cannot commit myself to. Different districts may have different views. I do think it is necessary to take cognisance of the extraordinarily diverse customs all over the country and not attempt to fix any uniform figure for the whole country.

21,769. You said just now you might take the 1912 basis and add whatever percentage you like. You did not mean to leave it to us to add what we liked?—I also said, so far as your organisation and our organisation was concerned, in my opinion our interests are pretty much the same. The higher the minimum wage the better pleased we should be, so long as we can sell the coal.

21,770. That is going to kill your scheme being accepted. You mean to form a syndicate against the public?—No, exactly the contrary.

21,771. You want to divide profits you can only secure by raising, by combination, the price of coal against the public?—No.

21,772. We are not going into a partnership of that kind to fleece the general public?—You do not understand; probably it is our fault. It is difficult on one sheet of paper to express precisely what you mean, and much more difficult to explain such a scheme but on the broadest possible principle. If there was any possible agreement to the principle suggested I do not think there would be a great difficulty in dealing with the details.

21,773. We found your people could not agree with the principle of nationalisation. All we required was to put forward our principle. They said: "We want to know your details," and we put them in their hands. Now we expect your details, and we have not got them?—The details of our scheme I frankly admit do not differ very materially, so far as wages go, with the method of regulating wages in the past except in the fundamental portion that as well as prices costs are to come in. You know quite well as far as Scotland is concerned—I only speak in detail of Scotland, because I am absolutely familiar with it and so are you—we had a sliding scale going back to 1902; they were 4d. compartments except perhaps once 4½d. in all the Conciliation Board decisions. From about 1905 to 1912, or thereabouts, it was always recognised, and not much disputed by either side, that 6½ per cent. on the wages cost 2½d. a ton, and for every 4d. of a rise or fall the wages changed 6½ per cent. up or down, so that it was quite well understood between us that above the minimum where the prices were rising or falling above 7s. 5d. level out of every

4d. the mine owner got 1½d. That was a quite well understood principle, I think you will agree.

21,774. We never agreed it was a fair principle?—Pardon me. I think you did agree it was a fair principle. In 1909 our agreement was that the relation between wages and prices in the past had been equitable.

21,775. No?—That is part and parcel of the clause of 1909.

21,776. I know it is. Every time an agreement was forced on us we accepted it in order to avoid strikes. We need not go into that at the present time. It is perfectly true 4d. increase in the actual realised value of the coal we got 6½ per cent., which we believed meant 2½d. P.—You use the word "believed." Part of our scheme is instead of letting you have the opportunity of saying you believe you will be able to say you know. Nine-tenths of the difficulties that have cropped up in my knowledge have been because you have used the word "believe." In some cases you have not believed. I want to put it beyond all doubt that you do know in the future—both sides know—what the collective cost is as well as the collective average selling prices. To my mind that is a much more important part of the scheme than any detailed arrangement of how the wages are to be regulated. We propose—to make myself a little clearer, perhaps—in order to arrive at this system to table the actual collective cost of production every three months and the collective selling price, so that both sides would have them before them or any arbiter they ultimately decided upon, instead of being in the dark, and in point of fact, generally speaking, both sides were in the dark about collective costs. Instead of having only one figure before them they would have both figures: the average selling price and the average cost of production. That is really, to my mind, one of the main things in the scheme we are suggesting; that will do more to prevent misunderstandings; that will do more to make a settlement of the wage question easier than anything else. The mere words of the scheme are secondary to the putting you in the position, and everybody in the position who is dealing with the wages question of knowing the real facts of the position.

21,777. I want to put it to you the reason why people work is not so much the love of work as to get wages to keep them; consequently in any wages scheme that could be jointly accepted you would require to fix a minimum wage which would be sufficient to keep an average man and his family?—I agree to that proposition.

21,778. I put it to you if you have 9 or 10 different districts, with a different minimum wage settled in each district, because of the nature and best practice of the district you might have, say, 10s. a day settled in one district and 7s. a day settled in another district for a miner's wages each of whom is doing exactly the same work for the same number of hours. Could you justify that?—That is not what would be the effect of the suggestion I am trying to make clear to you. Assuming you took the rates that were fixed in 1912 all over the country, and, for the sake of argument, add 100 per cent. to them and call that the minimum wage for the next year or two, that keeps the relation between the district more or less the same; the different wages that are paid to the different classes of men in the district would remain in the same relation to one another, and you would have the minimum upset.

21,779. Are you aware the minimum wage fixed by the Chairman—you say you take them all standard now and you might add 100 per cent., or whatever percentage it is—are you aware they range from 3s. 3d. per day up to 7s. 3d. per day and that in some districts the minimum wage fixed by the Chairman was 7s. 3d. and others 5s. 6d.? Ours is 5s. 10d. in Scotland. Some districts are as low as 3s. 4d. and 3s. 6d. Do you think it is just and equitable to continue a system in which one man in one part of a district is making 3s. 6d. a day or 100 per cent. on that, 7s. a day against another man's 15s.?—I want to bring you to this position for a moment. I saw you speaking to Mr. Herbert Smith beside you. I think his rate is 7s. 6d.

23 May, 1919.]

MR. WALLACE THORNEYCROFT.

[Continued.]

21,780. *Mr. Herbert Smith*: 7s. 3d.?—Against what you call 5s. 10d. My answer to that is they do not apply to the same type of man.

21,781. *Mr. Herbert Smith*: But they do?—No, I do not think they do.

21,782. They are colliers and machine fillers?—We had all these things very well thrashed out at the minimum wage time. In Scotland the system is quite different to the system in Yorkshire. There are comparatively few men on the 7s. 6d. basis in Yorkshire, whereas there is a very large proportion of the men on the 5s. 10d. basis in Scotland, and of the men who are on the 5s. 10d. basis there is just about the same proportion in fact who earn wages conformable to the same type in Mr. Smith's district. There were plenty of men who earn wages on the 5s. 10d. basis. It is according to the custom of the country.

21,783. *Mr. Robert Smillie*: Might I put it to you that under the Scottish chairman's finding no man, no matter how skilled he might be, can earn more than 5s. 10d. If the chairman's award is carried out, 5s. 10d. is the highest amount he comes up to. In Mr. Smith's district 7s. 3d. is what a skilled coal getter can get. Mr. Smith and I do not agree with you. They are the same kind of men; they are coal getters at the face, machine fillers at the coal face—all those come under the 7s. 3d. Take the case of Yorkshire and Somerset or Yorkshire and the Forest of Dean, or take South Wales and the Forest of Dean, within a stone's throw of one another—there is a difference there of 3s. 6d. a day between the minimum wage fixed for the Forest of Dean and the Somerset miners and the South Wales miners. I ask you if that is just and equitable, if it is true that the wages are paid to the men in order to enable them to live?—My contention will prove to be absolutely right when you refer to the average wage per person employed below ground. You will find that the average wage per person employed below ground does not differ in the districts to anything like the proportion that you are putting forward now. The average wage to the person employed below ground is the better reference.

21,784. You do not propose to ask any Chairman to fix the average wages per person employed below ground?—No. But I prove that what I am saying to you is right in fact by referring to the average wage per person employed below ground. I know if you take Mr. Dickinson's figures at the present moment for those collieries that he put in, the average wage per person employed below ground does not differ in anything like the proportion that you would be led to believe if the wages were in the proportion of 7s. 6d. and 5s. 10d.

21,785. That is perfectly true, because in Scotland the boys enter the mine at a higher wage than in other districts; but what has that to do with fixing the miners' wages?—It has a great deal to do with it.

21,786. On your scheme would you fix the miners' wages, the hewers' wages, and the men who work at the face at 7s. 6d. in one part of the country and 14s. in another?—I put it to you that, as a practical manager going from one district to another, you cannot compare any particular name of any particular person.

21,787. Will you say Yes or No to that question: are you prepared to fix it at 7s. 6d. in one mining district and 15s. in another? Is that what you mean by fixing the minimum wage in a district?—What I mean by fixing the minimum wage in a district is, taking a date where it is fixed in 1912, the proper thing to do is to put a uniform percentage on to that.

21,788. You will not answer straight to my question. You fix 3s. 3d.?—Where is that?

21,789. Take Somerset, or take Scotland, 5s. 10d. What you mean is to take the rate fixed by the Chairman in that district?—I have Somerset now. He calls it a brancher. I do not know what a brancher is.

Chairman: Sir Richard will tell us.

21,790. *Sir Richard Redmayne*: A brancher is a man who takes a branch.

Witness: He is the 3s. 5d.

21,791. *Mr. Robert Smillie*: Have you the list for Somerset of the highest wage men?—3s. 5d. plus a percentage at that date. There is 25 per cent. on to that. That would be another shilling roughly. One has to read the whole book to be sure what one is talking about.

21,792. 25 per cent. on 3s. 5d. would not be a shilling?—It is something approaching it; it is 11d. That just shows how difficult it would be.

21,793. That makes it 4s. 3d. Are you prepared to fix the wage at 4s. 3d. and then say that you would add 100 per cent.? That would be 8s. 4d. in Somerset, while in Yorkshire, if you fix it at 7s. 3d. plus 7s. 3d., it would be 14s. 6d. Is there any justification for fixing 8s. 4d. in one district and 14s. 6d. in another?—There may be some very good reason. I do not know the customs in that district. I should say there is probably some compensating advantage in some way that I do not understand.

21,794. The principle is that you would be prepared in fixing the minimum wage to fix the wage that was agreed to by the various Chairmen in the different districts, and you would add 100 per cent., or whatever else was necessary, to meet the increased cost of living. If it was 100 per cent. added I say that that would mean 14s. 6d. in Yorkshire for a miner at the face or a machine man at the face, but it would only be 8s. 4d. in Bristol. That is the position. It would be 11s. 8d. in Scotland as against 14s. 6d. in Yorkshire and 15s. in South Wales and 8s. 4d. in Somerset?—And the average itself would come out per person employed much about the same.

21,795. That does not matter.—That is where I disagree with you entirely; it does matter a great deal.

21,796. Your position is that you would take the wage fixed by a neutral Chairman at a certain period, and you would add whatever you thought was necessary to bring it up to the present position?—Not by a neutral Chairman, but by some pretty strong body which could fix the minimum according to the other trades. Keep that in your mind.

21,797. We have it that the wages in the coal trade are not to be fixed by the Board?—I am not reading into this any more than No. 1 in Lord Gainford's proof: "A minimum or standard rate of wages to be paid to each class of workman in that district, and which for the protection of the consumer should be fixed by machinery to be set up in conformity with the proposals of the National Industrial Council."

21,798. That was not proposing to take it out of the hands of the British mine workers, was it, and the British mine owners?—It is proposed to fix the minimum by that body.

21,799. By what body?—By some independent body—Independent of you and independent of us.

21,800. We need not go any further, if that is the proposal. Then when you fix the minimum wage, what happens?—Then the rises above that should be fixed between you and us.

21,801. The rises are to be so much if there are profits made; so much would go to the workman and so much to the employer?—Yes.

21,802. Supposing a district was making losses all the time and other districts more favourably situated were making profits, the miners in the districts which were doing well might be getting 5, 10 or 20 per cent. in their dividend, but the other miners in the other districts would get nothing. Is that what you want the Minors' Federation to take up?—No, that would not be the position, and it would not have been in the past position. It is astounding how the districts react on one another in a free market. The profits in one district have not materially differed from the profits in another.

21,803. But that is what you propose, that each district should hang on its own trade, and the wages should go up and down according to the profits gained in the particular district?—I think in practice you would find that it would work very much as it has in the past.

21,804. You mean the wages of the miners to be regulated according to the profits earned in their particular districts?—That is our proposition.

23 May, 1919.]

MR. WALLACE THORNEYCROFT.

[Continued.]

21,805. Would you make any provision in the event of the poorer districts not making any profit, and not being able to give any increase, while the others were. Would you help the poorer districts?—I would wait until that difficulty arose. I do not think in a free market it would arise.

Chairman: Now I think Sir Leo wishes to ask a question.

Sir L. Chiozza Money: No, not now, sir: my question has been sufficiently covered by the concluding questions.

21,806. Sir Adam Nimmo: Might we first take this minimum wage that you have been dealing with? Do you think that any good purpose is served in the present situation by going back precisely to what was done in fixing the minimum wage in 1912?—I do not. I think it is much better to stick to the work that was done in the interests of both sides.

21,807. I suppose that, at the present time, the minimum wage that would be fixed would be fixed in the light of existing circumstances?—Yes.

21,808. There would be a review of the existing conditions?—Yes.

21,809. And within that review the minimum wage of the mining industry would be fixed in some relation to the minimum wages fixed in other industries?—Yes.

21,810. You do not take the view, do you, that the minimum wage that would be fixed in the mining industry would be precisely the same minimum wage as would be fixed in the other industries?—No.

21,811. Would you have before you this, that the tribunal would take into account any special conditions that appertained in the mining industry?—Yes.

21,812. And would reflect these conditions in the minimum wage that was fixed in the mining industry?—That would be my hope.

21,813. Would they have regard to past wages that had been ruling in the mining industry?—Yes.

21,814. Would you say that side by side with that, they would have regard to the existing standard of living?—Yes.

21,815. The object being to maintain a fair standard of living?—Yes.

21,816. You seem to be in some difficulty with Mr. Smillie as to how this minimum wage would be fixed and what would be the machinery under which it would be fixed. Has it not been suggested that the machinery would be set up by Act of Parliament?—Yes.

21,817. And that the machinery within that Act of Parliament would fix the minimum wage for the mining industry and for all the other industries?—That is what we had in our minds.

21,818. Why do you take the view that the minimum wage in the mining industry must bear a definite relation to the minimum wage in other industries?—Because the minimum wage has a very important bearing on the price of coal in ordinary times, and if the minimum wage is fixed too high, it re-acts on the whole country as well as on our own industry.

21,819. You cannot, in short, put a miner's wage in a privileged position?—That is my opinion.

21,820. It must be more or less closely related to the wages in other industries?—I think so.

21,821. Is that due to the fact that these other industries are dependent on the mining industry?—Yes.

21,822. And if the wages in the mining industry are fixed too high, that position must re-act prejudicially on the other industries?—Yes. You draw an immense number of people into the industry if the output of coal could be absorbed. You get an upset of balance, which is bad for everybody.

21,823. Would it be your view that, in the long run, that would permanently injure the mining industry itself?—That is my opinion.

21,824. Would you go so far as to say that the real interests of the miners are bound up with, and their wage fixed out of correspondence with, the wages in other industries?—It is rather difficult to give advice to the opposite party, but that is really and truly my opinion.

21,825. In the past where wages have been dealt with in districts, it has frequently happened, has it not, that there may be a movement in respect of wages in one district without immediately bringing about a movement in another district?—Yes, without immediately doing it, though it is seldom very long before it does.

21,826. In the long run the wages in the different districts approximate to one another?—Yes.

21,827. Is it your view that the earnings per person employed in the different districts wonderfully approximate to each other?—Yes.

21,828. It was suggested to you that under the scheme which was proposed by the owners, what they had in view was really to form a controlling syndicate?—It was suggested, but nothing is more contrary to the fact.

21,829. Would the industry rest on the ordinary economic basis within the scheme?—Yes, the scheme is specially designed so as to make no alteration to the principle of free competition between individuals and districts.

21,830. I take it that you look upon it as essential from the point of view of the prosperity of the industries of the country that there should be free competition?—I do.

21,831. And that the commodity should be sold at the price which can be obtained in the market upon the basis of open competition?—Yes.

21,832. It has been suggested that this scheme of the owners is a special profit-sharing scheme. Does it in principle really go further than the principles that have been accepted in the past?—Except in bringing in the element of cost, as well as the element of selling price?—No. In fact the wages you and I are familiar with in Scotland have been regulated very closely indeed by profits in the past.

21,833. The sliding scales which have operated in the past have in reality been profit-sharing schemes?—Yes.

21,834. The difference in the past was this, was it not, that the price alone was taken as the measure of the financial ability of the industry?—Yes.

21,835. And that as the price moved up, the wages moved up in definite correspondence?—Yes.

21,836. Would you not say that in reality that was a profit-sharing scheme?—I think it was.

21,837. You agree, I think, that the difficulty that we have had in the past has been that the workmen have said that prices alone ought not to be taken as a determining factor?—Yes.

21,838. Have the owners realised that that was a difficulty that they should try to meet?—Yes.

21,839. Is this scheme which is put forward an effort to meet that difficulty?—It is.

21,840. It goes so far, does it not, as to be a serious attempt to give the men a real interest in the financial results of the industry?—Yes, and especially it gives them an interest to try to help us to reduce costs, because they would get the benefit of a reduction.

21,841. That is to say, if they increased the volume of production, or if they and the owners together reduce the cost of production, equally with the owners, are interested in the whole margin between the cost of production and the realised price?—Yes.

21,842. So that the two sides stand upon an identical basis as far as advantage or disadvantage is concerned?—Yes.

21,843. It is proposed, is it not, to give the men a minimum wage?—Yes.

21,844. We have been dealing with the adjustment of that minimum wage, but the point I wish to deal with now is that the men stand upon a definite minimum wage?—Yes.

21,845. Would it be your view that that minimum wage would be the subject, let me say, of constant change?—No.

21,846. What would be your view about that?—I would say until material reduction in the price of commodities generally takes place, the cost of living, the wages would have to be maintained, but how long we will be able to go on with the present high price of coal I do not know. So long as the minimum wage is in accordance with the general cost of living, in my opinion, the minimum should not be altered.

23 May, 1919.]

MR. WALLACE THORNEYCROFT.

[Continued.]

21,847. Would it not be likely to work out in this way, that the likelihood of change would be very little if the minimum wage were fixed in relation to the minimum wage of all other industries?—I think the chance of change would be reduced, that is, if the minimum wage always became a broad national question.

21,848. The chance of change in that minimum wage of a downward character would not be great?—It would be a tremendous speculation, because the minimum wage fixes the cost of production in all articles, and if it is fixed at a higher price than the world's market would swallow, it would have to come down.

21,849. On the one hand, we fix the minimum wage for the men so as to give them an assurance that their wages would give them a fair standard of living?—Yes.

21,850. On the other hand, it is proposed that the owners should have a minimum return on capital or profit earned for redemption of their capital?—Yes.

21,851. Do you regard it as only fair that if the men are assured of a minimum wage, the owners ought to be assured of a minimum profit?—I think it is to the interest of both parties, because if the owners do not get profits, the industry would die.

21,852. Do you think it is really, in the long run, in the interests of the men themselves to cut down the profit on the industry too much?—No, I do not.

21,853. If a fair interest is given to the industry, does that not mean that more money is thrown back into the industry?—Yes, and it accelerates development, which at the present moment is very necessary indeed.

21,854. The money is put into the industry again in capital expenditure securing development, and that broadens the basis of employment?—Yes.

21,855. And ultimately the workmen themselves are benefited by that?—Yes.

21,856. It was suggested in criticism of a previous witness that if a minimum wage was paid for a time when it was not justified by the profits which were earned, the men would object to what was called a drag upon their wages until they had made good to the employer the minimum profit that he was to get. Do you think there would be any such difficulty?—No.

21,857. In practice?—No, that has always been the case in the past.

21,858. It is not a new principle altogether?—Not at all.

21,859. We have known about the application of this principle certainly in Scotland?—Yes.

21,860. I do not know whether it has been applied in other districts of the country or not, but in Scotland I think you are familiar with an arrangement that was made some years ago under which this principle was put into operation; is that so?—Do you mean just before the war?

21,861. It was some time before the war?—It has always been in operation. In every sliding scale we have it, it has been in operation because the price above which a rise was to take place was always considerably above the average price of the depressed periods; therefore, we always had a very short time, but sufficient time, to make up shorts, so to speak, before the advance in wages took place.

21,862. In fact it was a principle that was acknowledged by the workmen's representatives as being quite fair?—I think it was quite well understood by both sides.

21,863. There might have been room for differences of opinion as to what the making up period should be?—Yes.

21,864. But there was no doubt that there should be a making up period?—Yes.

21,865. Under this scheme that is proposed by the owners there would be no difficulty whatever in ascertaining what should be the period of the drag upon the wage?—I do not see any difficulty in practice.

21,866. Would not the position be this under the scheme, that all the cards would be on the table?—Yes.

21,867. And that the position would be definitely disclosed to the workmen's representatives?—Yes.

21,868. And they would be able to determine the exact amount of money which had to be made up to the owners, and would fix the period of drag in relation to that amount of money?—Yes.

21,869. So that any difficulty that the workmen in accepting that principle in the past might have had would have been overcome in the arrangement with the owners?—Yes.

21,870. Some questions were put to you as to how you would get the tribunal that should fix the minimum wage for the mining industry and for the other industries. May I take it that all you want in this matter is to secure impartiality and independence of judgment?—Yes.

21,871. May I take it that you think it would be better to exclude, as far as possible, from the position of actually giving a decision parties who were directly interested in the matter?—Yes, as far as the minimum wage goes I think so.

21,872. These parties might give as much advice as possible on the particular questions?—Yes, they must be heard, of course.

21,873. But I take it that what would be a desideratum would be that the tribunal would be composed of impartial and independent men as far as we could get them?—Yes.

21,874. As you have indicated before, it is really the man that is the essential thing in dealing with an important question of this kind?—Yes.

21,875. And having regard to the magnitude of the questions involved we would want in this case the biggest man and the best informed man that the country could give?—Most undoubtedly.

Mr. Herbert Smith: What do you mean by "biggest"; do you mean biggest in build?

Sir Adam Nimmo: No, the biggest in idea, in conception and in grasp.

21,876. It was put to you in dealing with these questions of the minimum that what you had in view was so low a wage as was previously in operation, let us say in Scotland, of 5s. 10d. to the hewer; but I take it you are not making any suggestion of that sort in the present situation?—No.

21,877. May I take it that you wish for a minimum wage to be established?—Yes; I even went so far as to say the higher the minimum wage was fixed at the better we as coalowners would be pleased.

21,878. And you want it determined in the light of all the circumstances?—Yes.

21,879. Dealing with the owners' scheme I think this was also suggested, that the scheme protected the consumer against the miner, but did not protect the consumer against the coal-owner; is there any foundation in fact for that suggestion?—None whatever.

21,880. Is it not the case that the coal-owners and the miners are going to be absolutely in the same boat in the working out of the scheme as far as the consumer is concerned?—Yes. I should have liked to make it clear when I was speaking to Mr. Smillie that in the periods of depression, when the minimum is operating, any reduction in cost owing to the joint efforts of owners and miners would certainly go to the consumer.

21,881. How would you bring that about? Would that be brought about by the ordinary operations of supply and demand?—Yes.

21,882. That is to say, free competition in the market would secure that the consumer was getting the best terms?—Yes.

21,883. At any given time?—Yes, that is one of the fundamental arguments, of course. As you are aware, few districts have had collective costs as we have had; and in making these statements that the price falls in the worst month, in the worst part of the cycle, to the cost is not theory; it is fact.

21,884. Now it has been suggested that the scheme proposed by the owners did not give the workmen any improved status; do you hold that view?—No, I do not; it is quite the reverse.

21,885. Would you give us your views on that? Does it not propose to give the men a very real place in the industry?—That is the intention to strengthen their position, in the future. The mining department has never been referred to by anybody that I have heard; at any rate I must have missed the questions. But that is a very distinct part of our

23 May, 1919.]

MR. WALLACE THORNEYCROFT.

[Continued.]

scheme, and that Mining Department would be the recipient of all the information as to costs, selling prices and so on; and the Mining Department would have as part of its organisation a strong Advisory Council on which the best brains of the industry both on the employers' side and the workmen's side would be acting together with men, as we put it, who are eminent in branches of science connected with the industry—by that, I mean men, both employers and employed—for instance, in the steel trade, who are very much interested in the production and closely allied to us—and we think the mining department—that, of course, would include metalliferous mining, iron ore mining and all the rest of it, we think it would be a big step in the progress of the industries connected with mining that such a department should be created with such a strong Advisory Council, which would practically be the advisers on all the main policy conducting the industry.

21,886. So that, on that Mining Council you would have the leaders of the miners, and you would have the leaders of the owners?—Yes.

21,887. Who would also have, I take it, working along with them, men of eminence who were regarded as being likely to assist in the working of the Council?—Yes.

21,888. Coming closer to the individual colliery position, does not the scheme of the owners propose to very materially increase the status of the miners?—That is the intention.

21,889. Is it right to say that at the present time, or say in pre-war days, that he had not a very real say in the industry?—I think they had.

21,890. Take, for example, the question of wages; on the Conciliation Boards, have not the owners and the workmen sat down together on an equal footing with others to discuss questions of wages?—They have.

21,891. They have, in more cases than otherwise, adjusted wages difficulties with each other?—Yes.

21,892. They have frequently agreed on general advances and general reductions of wages?—Yes.

21,893. Would you say that there was anything more important to the industry that the men could be asked to deal with than a discussion of these wages questions?—No, I do not think so.

21,894. Has that machinery been going on in the industry for a long time?—Yes, in Scotland since 1902.

21,895. Now, coming to the other parts of the machinery, have the men not been co-operating with the owners on district committees for some time?—Yes, disputes committees and the like.

21,896. It has been the custom, has it not, to bring the men in connection with these disputes committees to endeavour to arrive at a decision of them?—Yes, in Scotland, certainly.

21,897. Would you say that the feeling that existed between the owners and the men on these committees was good?—Before the war, certainly.

21,898. And that the parties sat down with an earnest desire to be helpful to one another in the light of the difficulties presented?—Yes.

21,899. When it comes to the question of status, on the scheme suggested by the owners what is proposed is this, is it not, that pit committees should be established which would be advisory in their character? Would it be your view that there would be considerable freedom of discussion allowed on these pit committees?—I think so.

21,900. Would the men be permitted to bring up before them any question that they felt was of interest to them?—I think so.

21,901. Would the only limitation to discussion that would take place be this, that they would not be able to exercise any authoritative decision in the conduct of the mine?—No, they would not.

21,902. Is it your view that, short of that, the scheme is intended to give as large an amount of co-operation as is possible?—I think so.

21,903. To secure as large an amount of co-operation as is possible?—Yes.

21,904. You have had a good deal of experience of the working of pit committees, have you not?—I have.

21,905. Would you mind telling us how they worked

out, in your experience?—It is about 20 years since I had the first properly constituted pit committee. That was at the Pleau Colliery, and there it was very successful. One of the fundamental parts of the agreement by which we constituted the pit committees was that either party could call a meeting, but in calling a meeting they must state the subject for discussion at that meeting, and no other subject was discussed. There was no restriction as to what subjects should be brought up at the meeting beyond the fact that it must be stated in the notice calling the meeting by either party.

21,906. Do you think that is an advisable thing in connection with pit committees?—I do. I am very strong on that from practical experience.

21,907. That is to say, that before a meeting is held there should be advice given as to the subjects to be dealt with?—Yes.

21,908. Do you think that is advisable in the working of a committee?—Yes.

21,909. I understand that on both sides it would be given?—Yes, like the letter asking for a meeting states the subject to be discussed at that meeting in an ordinary businesslike way.

21,910. *Sir Arthur Duckham*: The owner has to say it as well?—Yes.

21,911. *Sir Adam Nimmo*: When an owner wished to raise a question at a pit committee he would give the same notice as would be required from the other side?—Yes; that has been the practice at my particular colliery for over 20 years, and I am glad to say that for 15 years after it started we did not have a single idle day.

21,912. So that you see no reason why these pit committees should not work satisfactorily on a co-operative basis?—No, I do not, so long as the spirit of co-operation and conciliation is present on both sides.

21,913. I suppose that is essential to the working of any committee?—That is most essential.

21,914. On the question of status I understand what you suggest is to give the men a place on these pit committees?—Yes.

21,915. And, I take it, to give them a useful place on these committees?—As I have just said, I think that committee that we had at Pleau was a most useful committee. All sorts of questions were discussed, and, as I have said, for 15 years we never had an idle day. All the questions that cropped up were settled.

21,916. Assuming there were questions unsettled at the pit committees, I take it all those questions would be referred to district committees?—Yes.

21,917. There again the men would be sitting down with the owners to discuss these questions really upon equal terms?—Yes.

21,918. And there would be the largest amount of freedom given for the full discussion of these questions?—Yes.

21,919. Does that not come to this, that what is proposed is to work the men into the industry as far as it is practicable, short of giving them any authoritative control or executive control over the management of the collieries?—Yes.

21,920. I suppose you take the view that joint control is impracticable?—I do.

21,921. Do you say that joint control is impracticable, whether it is joint control between the owners and the workmen or, on the assumption of nationalisation, between the Government and the workmen?—I do.

21,922. You do not think it matters at all as to who are the owners as to whether joint control is practicable or not?—The authority of the man in charge of the colliery must be maintained intact.

21,923. And you take that view, whether it is State ownership or private enterprise?—Yes.

Sir L. Chiozza Money: Would you kindly ask him whether that goes beyond the management of the mine?

21,924. *Sir Adam Nimmo*: Do you confine that control to the management of the mine, or would you have it in view that control at some other point might be conceded?—I should like to put it in this way, that the Advisory Council, and ultimately Parliament, should lay down the rules, laws and regula-

23 May, 1919.]

MR. WALLACE THORNEYCROFT.

[Continued.]

tions on which the mining industry has to be carried on; and, subject to those rules and regulations, those who are responsible for the efficiency, for the safety, and for the economy of the mine must have the executive power at the mine, and in all things connected with the mine. All these advisory and discussion committees are excellent things in order to ventilate possible disputes and grievances, or to make suggestions for the social welfare or for the underground welfare, or any other questions that may arise, and a manager would be a fool if he does not take cognisance of suggestions that are of value. I do not think any one of us have ever had suggestions that were of value that we have not acted on or have ever for long managed a mine without having had valuable suggestions from those employed by us. As I say, a man would be a fool not to take advantage of any suggestions made to him for the benefit of the concern, but the responsibility for saying whether A, B or C shall be done or whether A, B or C shall not be done must remain with those who are responsible for the mine and the carrying on of all its departments.

21,925. I think you do suggest in your *précis* that in certain circumstances it might be quite a feasible thing to ask a representative of the miners to go to the Board of Directors. Would you explain what you had in your mind when you said that?—Yes. I would personally in any big company that I had to do with welcome the miners collectively or individually (it would probably be collectively) buying a block of shares, and if they did that I know quite a number of miners or their agents whom I would willingly invite to sit beside me on the Board, and whom I should find to be very useful colleagues, provided that our interests were in common, and we were not pulling against one another at the Board room meetings.

21,926. That is to say, you suggest this condition, that the representative of the workmen on the Board would have to represent financial responsibility?—Yes.

21,927. It would be on that ground that you would regard it as feasible to elect a representative of your workmen on your Board?—You could not manage a pit by a sort of debating society to carry on the every-day work of a colliery. That would be impossible.

21,928. You would desire to encourage the workmen to invest their savings in colliery undertakings?—I should like that.

21,929. If they did that to any considerable extent you would be prepared to recognise that by giving them responsibility on directorates?—Yes.

21,930. I take it that if they were in that position they would have an entirely common aim with the Directors of the company?—They would very soon find that they had.

21,931. And having that aim in view, they would be concentrating on precisely the same objects?—Yes; and they would very soon find that the work of the Directors was not such a sinecure as has been suggested.

21,932. Dealing with the owners' scheme, there is another portion of it which deals with the conservation of the nation's resources and endeavours to provide a means of preventing loss or waste of coal in any direction?—Yes.

21,933. Would you agree that that machinery should go so far as to deal with the lay out of the mine before it was opened up at all?—It depends what you mean by "deal with the lay out" of a mine. If it means that when you are starting a new pair of pits or something of the sort you had to submit plans showing the area that you propose to work from those pits, yes. But to go into all the details of the mechanical arrangements, and all the rest of it, I think would be impracticable.

21,934. I agree. What I put was in view of where you had a new take and you were proposing to develop that, the proposals in respect of development might be submitted to the Mining Council?—Yes, the broad outline. I would have no objection.

21,935. Are you aware that that is contemplated within the proposals of the Land Acquisition Committee?—So I understand.

21,926. Take another case. Take the case where it was quite clear that in respect of certain mines there was glaring inefficiency, contrary to the national interest, are you aware that that Committee proposes to intervene through the Mining Council and possibly the Sanctioning Authority?—Yes. I read that part of the final report.

21,937. In fact, in paragraphs 24, 25 and 26 of the report these matters are dealt with. I understand the proposals of that Committee to go so far as to suggest this, that the Mining Council might even intervene to secure improved methods of working?—Yes, that is what is suggested.

21,938. Do you accept these proposals in principle?—Yes; there would have to be pretty strong cases, and the machinery working this out requires, to my mind, a good deal of thinking about, but that is just what we have provided for in the scheme, that the suggestions put forward here, if intelligently worked by the Mines Department, would be of great advantage to the country.

21,939. I suppose the underlying principle that would be involved would be this, that the case would have to be one where the conditions that were operating were contrary to the national interest?—Yes.

21,940. So long as that was proved, that the Mining Council and Sanctioning Authority should be entitled to intervene?—Yes.

21,941. You were asked by Mr. Smillie as to whether there were not certain teachers abroad who suggested that thrift ought not to be encouraged?—Yes.

21,942. Did we not have one or more economists who came here who seemed to indicate views of that kind?—I really did not pay a great deal of attention to all they said.

21,943. It seemed to me that the statements of Mr. Cole practically amounted to that?—Yes, he was pretty extreme.

21,944. Because he rather suggested that a man ought not to be entitled to have any return on money which he invested, and would that not amount to this, that there would be no encouragement to thrift at all. Do you agree? If an investor was not to get any money at all in return for what he invested, that would be no encouragement to thrift at all?—Yes, I think that would be so.

21,945. Do you know a number of miners who own their own houses?—Yes.

21,946. Does that not apply in all the districts of the country?—Yes, especially the older districts.

21,947. There are thrifty men among the miners anywhere?—Yes.

21,948. Do you see any difficulty in most of them doing what a large number have already done?—I see no reason except the individuality of the person.

21,949. I suppose you would agree that the wages that they are earning now are very high?—They are.

21,950. And that there is lots of room for saving?—I think so.

21,951. It might be a good thing if the saving took place at the present time and these savings were put into houses or other things for their benefit?—Yes.

21,952. We have heard a good deal of the low wages which have been earned by the miners?—Yes.

21,953. I wonder if you saw a statement that appeared in the newspapers recently as to miners making as much as £790 a year?—I am not in the least surprised.

21,954. Mr. Robert Smillie: Did you see the statement?—No, I did not, but I am not surprised to hear of it.

Chairman: Then if you did not see the statement, we cannot go any further with it.

21,955. Sir Adam Nimmo: I refer to the fact that it was published in the papers and was open to all of us here to see it?—I asked for a number of returns from some of the different places that I have to do with, and they are here for the household.

21,956. Sir L. Chiozza Money: That is not what you were asked, was it?—This is given in so many pounds a fortnight, such as £9, £13, and so on.

21,957. How many people is that for?—One person.

23 May, 1919.]

MR. WALLACE THORNEYCROFT.

[Continued.]

21,958. That would be about £2 a week on pre-war values?—Quite so. I have here a man with his sons making £45.

21,959. *Mr. Sidney Webb*: How many sons has he?—Three sons.

21,960. *Sir Adam Nimmo*: I do not want to make any more of this than is necessary. We have published statements showing the very high wages that have been earned. Statements have been made as to the amount that the workers take out of the industry. It is sometimes said that they do not receive any more than one-third of the total return from the industry. What do you say with regard to that?—Since I was here the last time, I have got from Professor Bowley, who, I believe, is an authority on that subject, a pamphlet of his that was published by the Clarendon Press in March of this year in which the direct contrary appears—namely, that two-thirds goes to the wage-earners and one-third to the others.

21,961. *Sir L. Chiozza Money*: Is Professor Bowley to be called here, because all these things are very questionable, and I reject them at once.

21,962. *Sir Adam Nimmo*: You do not agree with the view that is going to be expressed, that the amount that the workers receive out of the industry is only one-third?—No, I do not. These figures prove quite the contrary, and my own experience confirms them.

21,963. *Mr. Sidney Webb*: Professor Bowley says 42 per cent.?—No. I think we had better have Professor Bowley here. I would refer you to page 32 of his publication.

21,964. *Sir L. Chiozza Money*: Professor Bowley shows that the manual workers take one-third?—No, he does not. The wages, salaries, profits of the principle industries from the census of production for 1907; wages, 344 millions; salaries, 60 millions—that is 54 per cent. for wages and 61 per cent. for wages and salaries.

Sir L. Chiozza Money: That includes your own salary.

21,965. *Mr. Sidney Webb*: It has nothing to do with the national income?—I beg your pardon, I think it has.

21,966. *Sir Adam Nimmo*: We will leave that question. I want to get from you your views as to the relations between the owners and the men before the war. *Mr. Smillie* especially referred to that, and it is suggested to us that the industry was in such a condition, the relations were so strained between the parties, that some entire change of power was necessary to carry on. Do you agree with that view?—No.

21,967. Is it your view that the relations between the owners and the men before the war were good?—I do not think they were bad, at any rate. There was friction in a few places very often, but certainly at the collieries themselves there was no friction to speak of.

21,968. Do you say this, that the number of cases of dispute that are likely to arise are greater in the mining industry relatively than in any other industry?—No, I do not think so.

21,969. Would you not say that that is due to the constantly changing conditions?—99 out of 100 disputes as to rates are settled.

21,970. On the whole, the owners and the workmen before the war were getting on quite well, were they not?—I did not feel that there was any great difficulty.

21,971. Would you not say, if anyone came forward and suggested that the relations were bad, that they were exaggerating the position?—That is my opinion.

21,972. Would you suggest that they were exaggerating that for some particular object?—That is what I have suggested.

21,973. I want to ask you about the question of coal-cutters in mines, because I know you have had a great deal of experience of that: Do you suggest that the industry, as a whole, has been backward in the application of coal-cutters and other mechanical arrangements?—No.

21,974. What would you say of your own district?—As it happens I have a return here showing the

amount of coal cut by machines at collieries that I am more or less responsible for, and it ranges from 100 per cent. at one to nothing in others: the figures are 100 per cent., 90 per cent., 54 per cent., 84 per cent., 85 per cent., nothing, nothing, 36 per cent., and 61 per cent.

21,975. Do you mean that under the same management you have pits where you have no coal-cutters, and you have pits where you have 100 per cent. of the coal got by coal-cutters?—Yes.

21,976. What does that mean?—It means that the particular circumstances of each case have to be considered, and while some advantages can be got out of coal-cutters in some places, which we take every opportunity of getting, at other places they are no use at all.

21,977. You have to consider the application in each case?—Yes.

21,978. Is there not a widespread view that all the coal owners have to do is to fill their pits with machinery, and very satisfactory results would be obtained?—That is the impression that one would obtain from a good deal of the proceedings here.

21,979. What do you say of that impression?—I think it is rot! You have to consider each particular case.

21,980. You are not suggesting that there may not be room for advance?—Certainly not.

21,981. And for improvement?—Certainly; we are always learning.

21,982. The fact that, under your management, you have places where you have no coal-cutters, and you have other places where you get all the coal by means of the coal-cutters, seems to indicate that you have to discriminate on the individual position?—There is no doubt about it.

21,983. Do you say the same thing with regard to conveyors?—Yes.

21,984. Is there not outside influence with regard to it?—Yes.

21,985. Is there not a tendency to condemn the industry in those respects quite unjustly?—So it appears to me.

21,986. Would it not be your view that, taking Scotland, for instance, all the practical men there would endeavour to apply coal-cutters and conveyors to the greatest extent possible?—I think they do.

21,987. Have you had much experience of conveyors?—Yes, a great deal; there is no colliery that I have got where I have not tried them in one seam or another.

21,988. Has your experience with regard to them varied considerably?—Very much indeed.

21,989. In some cases have you been able to apply conveyors?—Yes, we have some conveyors going of course, but, as I said last time I was here, we have more on the scrap heap than in the pit.

21,990. That is to say, in the pit you cannot make the application of these things?—Yes, that is so.

21,991. But you go as far as your practical experience permits you to go?—Yes.

21,992. You refer, in your *précis*, to the statements that were made by Sir Richard Redmayne. I take it that your view is that there may have been some misunderstanding as to Sir Richard Redmayne's attitude?—Yes.

21,993. And that probably he did not intend to refer to the technical management of the British collieries.

Chairman: Need we ask this witness what the probabilities of Sir Richard Redmayne's intentions are?

21,994. *Sir Adam Nimmo*: I wanted to get that so that I might go on to the other question. Would you say that, in respect of the 9 points to which he refers, that he is on very contentious ground with regard to most of them?—Very.

21,995. That is to say, you would get as many experts to come forward on the one side to say that he was wrong, as possibly you would get on the other side to say that he was right?—I should say so.

21,996. And that practically in all these questions it is an open matter for consideration in the light of all the circumstances offered?—Yes.

21,997. I take it that your own view is contrary to the view expressed by him?—Yes.

23 May, 1919.]

MR. WALLACE THORNEYCROFT.

[Continued.]

21,998. Mr. Sidney Webb asked you some questions as to the qualifications of the Scottish general managers or agents. Do you not regard these men as highly skilled?—I think they are very good.

21,999. Must a man dig coal and put up props in order to say that he is qualified as a practical man?—I do not think so.

22,000. Would you not think that these men who are in control of the larger undertakings in Scotland and elsewhere are essentially practical men?—I think so.

22,001. Have they been dealing with practical problems all the time?—Yes.

22,002. Have they, by observation, experience and investigation, been up against practical questions all the time?—Yes.

22,003. Are they not nearly all men who have made considerable contributions to the mining side?—Some of them.

22,004. Some of the very men Mr. Smillie referred to, as, for example, Mr. Mowatt?—Yes.

22,005. Would you not say that a man like that was among the most eminent men in mining science in the country?—Yes.

22,006. You would not suggest that he was not a practical man?—No. I should say that Mr. Mowatt is essentially a practical man.

22,007. We know that most of the men who are controlling the larger undertakings are men of that type?—Yes.

Chairman: Most of the men who controlled these mines are of the type of Mr. Mowatt. Need we ask these questions?

22,008. *Sir Adam Nimmo:* I want to ask you one or two questions about distribution, because you put in a statement with regard to distribution. Have not the views which have been recently expressed with regard to distribution been largely coloured by what has happened during the war?—I think so.

22,009. Do you think we should base upon these conditions at all?—No, I think it is very dangerous to do so.

22,010. If you take the pre-war condition with regard to distribution, do you think there is much wrong?—No.

22,011. The figures you gave yesterday do not seem to indicate that there was much wrong?—I think not. I think the competition between the coal merchants in the towns was quite sufficiently keen to keep down the prices as a rule, and there was nothing to prevent anyone buying from co-operative societies. If the co-operative societies could do so much better, it puzzles me to know why everybody does not go to a co-operative society.

22,012. From your general knowledge, would you say that figure of 5s. 6d. out of 22s. represented an excessive charge made by the coal merchant for the services rendered by him?—No. I used to run a business of the sort myself from a depot in Glasgow, and I found competition was pretty keen.

22,013. I have had a similar experience in another city where I thought it better to give it up altogether, because it would not pay. I take it that this price has to cover all the contingencies of the coal merchant: short weight, bad quality, stones and impurities, which he may find in his coal?—Yes.

22,014. That is the total amount of money on which he has to pay his wages?—Yes.

22,015. Do you know that it is the case that the figures submitted by the co-operative societies were pre-war figures?—I have not seen any.

22,016. You did not hear those figures applicable to Scotland?—I have not seen them.

22,017. Your figures submitted appear to be applicable to the pre-war period?—Yes.

22,018. Do you think it is unfair to base anything on these figures?—I do, because I think a great mistake was made in fixing them.

22,019. I know that, in conjunction with your collieries, you are vitally interested in the export trade. Do you look upon it as essential to maintain the export trade at the full flood?—As far as Scotland is concerned, the maintenance of the export trade is vital to industrial life, in my opinion.

22,020. Would you say that in working the export trade it is very essential to have freedom of movement on the part of those who are working the trade?—Freedom of movement, as in price?

22,021. Yes, by the exporter who is working the trade in the different districts?—Yes.

22,022. Would you say also that there must be room for rapid decisions being made?—That is my experience.

22,023. Is it your view that we could not expect to secure these elements under any centralised system of dealing with the coal trade of the country?

—It is, for the reason that, whenever you have a fixed price, competition becomes much easier for your opponent, and it is very bad for your own trade.

22,024. *Chairman:* Who is the opponent in the case you are thinking of?—American or German coal, or any other coal you are up against abroad. We are not up against it at the moment, but in time I have no doubt we shall be up against German coal in the Baltic, and we are now up against American coal in the Mediterranean.

22,025. *Sir Adam Nimmo:* I suppose the exporter has to study the world's movements in the coal trade?—Undoubtedly.

22,026. He has to be ready at any moment to take action in the light of his experience and knowledge?—Yes.

22,027. Do you think, if the mines were nationalised, we should not be running a great risk of imperilling the great trade of the country?—I think we should.

22,028. *Sir Arthur Duckham:* You were speaking about a share in the directorship of the collieries being given to the men if they had financial responsibility. Does not your profit-sharing scheme entail financial responsibility to a certain extent?—No, they have no share in any losses; they are guaranteed their minimum wage.

22,029. You would not suggest giving them a directorship as profit-sharers?—No, that is not in the scheme.

22,030. Would you personally think that it was a proper thing to do? Can you see any objection to doing that?—I see a great objection so long as our objects are not common.

22,031. If the men are profit-sharers, your objects are common?—We should like to have a little experience of the working of the scheme before it went as far as that.

22,032. You would be a little frightened at having the miners on your board, even if you were profit-sharers?—It is rather difficult, as I am here in a representative capacity, to give an opinion on that.

22,033. I do not know whether the Chairman will release you from your representative capacity, and allow you to answer it?—It depends so much on the individuality of the person whom I invite to be with me on the board.

22,034. May I put it to you that no director is on a board without the approval of his colleagues?—That is so.

22,035. That is an essential thing in the working of a company?—Yes.

Chairman: We are very much indebted to you for the assistance that you have given to us.

(Adjourned for a short time.)

Sir Arthur Duckham: Sir, may I put a question to the witness with regard to Mr. Merz's evidence?

Chairman: Yes.

22,036. *Sir Arthur Duckham:* (To the Witness.) Just taking you back for one minute to Mr. Merz's evidence, may I read this expression, which appears

in his *précis* (Shorthand Notes, Second Stage—13th Day, page 785): "The more extended use of electricity accounts to a great extent for the fact that the consumption of boiler fuel at collieries in Durham is only 3 per cent. of the total output of coal as against 5·7 per cent. in Yorkshire, 8·3 per cent. in

23 May, 1919.]

MR. WALLACE THORNEYCROFT.

[Continued.]

Lancashire, 9.1 per cent. in Scotland, and 5.6 per cent. in South Wales. This seems clear evidence of the great economy which could be attained if a cheap supply of electricity from a public supply undertaking were everywhere available." I raised the question with Mr. Merz, and he qualified his statement by saying you could not base strong arguments on these figures. I would like to have your experience on that consumption of the collieries, because it is very interesting?—I saw that statement, and I at once fastened upon it as being a mistake, for the reason that the value of the coal consumed at the collieries is assumed to have the same value as the coal used by railways and works and for domestic purposes. That is not the fact. In fact, the coal used at the collieries is the worst coal produced, and very often is a material which is unsaleable in ordinary times.

22,037. That is the question of quality?—The calorific value of the fuel used at the collieries is the lowest. It is small rubbishy stuff, which is more or less unsaleable in ordinary times. Comparing Durham with the rest of the country, the facts are quite true that in Durham the boiler consumption is only about 3 per cent., but Durham happens to

be the county where a greater proportion of coal is coked than in any other district, and one knows the coking coals of the County of Durham are noted in quality. When they have coke ovens, there is a large amount of surplus heat available from the coking process which is used for the production of steam and power. This says that in Scotland 9 per cent. of the output is used for colliery consumption, but it is always a very low grade. In Scotland the electric power used per ton of output is 1 horse-power for 396 tons, whereas in Durham it is 1 horse-power for 452 tons.

22,038. That is to say, there is more electricity used in Scotland than in Durham per ton of output raised?—Yes, there is 25 per cent. more electricity used in Scotland than there is in the County of Durham.

22,039. The other point Mr. Merz could not answer, which I asked about, was the difference of the depth of the pits and the water. Are there greater depths in Scotland than Durham?—I could not answer that question, but I should say probably Durham and Scotland compared are the same.

22,040. In South Wales there would be presumably greater depths?—Yes.

(The Witness withdrew.)

Chairman: That concludes the evidence on behalf of the Mining Association, and we will now go to the

evidence on behalf of the Miners' Federation, and I will first of all call Mr. Slessor.

Mr. HENRY H. SLESSOR, Sworn and Examined.

22,041. Chairman: I believe you are a Barrister-at-Law, and you are Standing Counsel to the Miners' Federation of Great Britain?—Yes.

22,042. I think on the instructions of the Executive Council of the Miners' Federation you have prepared a Parliamentary Bill (see end of Witness's evidence) which embodies their scheme for the nationalisation of the mines and minerals of Great Britain?—Yes.

22,043. I think you do not speak at all as to any question of policy?—No.

22,044. So far as the law is concerned, your function is to put these suggestions in the form of a Bill on the instructions of the Miners' Federation, and you are prepared to answer any legal questions on the drafting?—Yes. As I understand it, this Bill embodies in a Parliamentary form the scheme which the Miners' Federation have adopted as to the nationalisation of mines and minerals.

Mr. Arthur Balfour: Do I understand that we shall have an opportunity of discussing the whole of the details?

22,045. Chairman: Yes. The witness is the Parliamentary draftsman.

Witness: That is so.

22,046. But you express no personal opinions?—No. I am prepared to explain the various clauses in the Bill so far as a legal opinion goes, but my opinion upon any other matter would not be of any assistance, I think.

22,047. We need not read the whole of the Bill, but in order that it may be followed I will go rapidly through it.

Clause 1 (1) establishes a Mining Council "consisting of a President and 20 members, 10 of whom shall be appointed by His Majesty and 10 by the Association known as the Miners' Federation of Great Britain." Then sub-section (3) says: "The members of the Mining Council, other than the President, shall be appointed for 5 years, but shall be eligible for reappointment," and so on.

Clause 2 (1) says: "The Minister of Mines and one of the Secretaries of the Mining Council (to be known as the Parliamentary Secretary and to be appointed by His Majesty) shall at the same time be capable of being elected to and of sitting in the Commons House of Parliament." Then section 2 (3) says: "There shall be paid out of money provided by Parliament to the Minister of Mines a salary at the rate of £2,000 a year, and to the Parliamentary Secretary a salary at the rate of £1,500 a year."

Sub-section (4) is: "The Minister of Mines and the Parliamentary Secretary shall be responsible to Parliament for the acts of the Mining Council."

Clause 3 is with regard to officers etc., and I need not go into that for the moment.

Clause 4 is as to the constitution of the Mining Council, and it says it shall be a corporation; they are to have a seal and various legal machinery is set up as, for example, that they may sue and be sued. Sub-section (4) is as to documents and so forth.

Then Clause 5 is important, because that is the section which transfers the mines and minerals to the Mining Council, and it says: "On and after the appointed day, save as in sub-section (3) of this section provided: (a) Every colliery and mine"—then it describes what a colliery is—" (b) All coal," and it describes what that is. " (c) All rights and easements"—and it describes them—" shall be transferred to, vested in and held by the Mining Council." That transfers to the Mining Council the collieries, the coal and other minerals and the wayleaves. Then sub-section (3) is: "Provided that the Mining Council may at any time before the appointed day give notice in writing to the owner of, or person interested in, any mine or minerals or rights, disclaiming, during the period of such disclaimer, all or part of the property."

Clause 6 provides for the purchase of mines: "6. The Mining Council shall purchase the mines of Great Britain in them vested by this Act (other than those which are the property of the Crown at the time of the passing of this Act or which have been disclaimed in whole or in part in accordance with Section 5 (3) of this Act) at the price and in the manner provided by this Act. Provided always that the value of any rights as defined by Section 5 (1) (c) of this Act shall not be taken into account in computing such price, for all of which no compensation shall be paid."

Turning back to Clause 5 (1) (c) you will see what has not got to be paid for. The things which have not got to be paid for are rights and easements, wayleaves, air-leaves or water-leaves, shafts, and so on, royalties, lordships or rights. Those things are not to be paid for. Royalties are to be taken without paying for them.

22,048. Mr. Arthur Balfour: It is "rights to use a shaft".

Chairman: Yes.

Clause 7 sets out the Commissioners for the purpose of assessing the price of the mines, who they

23 May, 1919.]

MR. HENRY H. SLESSER.

[Continued.]

are to be, and what they are to do, and how they are to act.

Clause 8 sets out the way in which the mines are to be valued.

Clause 9, which is important, sets out the ascertainment of the purchase price, and it sets out the maximum. It says, having regard to a particular consideration, they are to be bought, but "as regards coal mines in no case shall the maximum price exclusive of associated properties be taken to be more than the following"—that is to say—"when 100,000 tons or less have been raised per annum on the average during such five preceding years, a capital sum equal to one such year's output, at 12s. per ton. When more than 10,000 tons have been raised per annum on the average during such five preceding years, a capital sum equal to one such year's output at 10s. per ton."

The associated enterprises of the collieries are to be valued separately. Will you kindly tell me there—no doubt, it is in your very carefully drawn proof—supposing you had a composite concern as, for example, a colliery which consisted of coal producing and partly of steel works, are the steel works to be taken over?—You will see Clause 5 (1) (a) deals with coal and other mines. Then there is power in Clause 5 (3) to disclaim any mines that it is not considered expedient to take over, and so it really rests with the Mining Council in each particular case to decide just what they will take over and what part.

22,049. No doubt it was my fault that I did not make the point clear. Supposing you had a company which owned coal mines and they used the coal for making steel in the same area. I have in my mind a colliery company like the Ebbw Vale Company. They have a large number of colliers who dig the coal and a large number of other workers who assist in making the steel. How does your draft provide for a case like that? What is to be done with the steel works?—That is a case, I think, in which the Mining Council have discretion. If they decide to take over the steel works as well as the colliery, they can do so; they can take it over as an associated property under Clause 5 (1) (a) if they wish. It depends whether it is in their opinion an associated property. If they do take it, they have to compensate separately for it.

22,050. No doubt some other members of the Commission will ask you questions about it, and I do not conceive it my function to do so; but supposing a colliery company has a line of tramp steamers who convey their coal from Durham to London, are the tramp steamers to be taken over?—I think the same answer applies. Clause 5 (1) (a) says: "All associated properties (including vessels, lighters, railway rolling stock, and all works, including works for the manufacture of bye-products, in the opinion of the Mining Council belonging to any mine undertaking or connected with any colliery or mine)." I would not say, with respect, that they will be taken over, but they may be taken over unless under section 5 (3) the Mining Council wished to disclaim ownership of that particular thing.

22,051. Under this a number of steel works or steamships might be nationalised?—Yes; but if they were they would have to be compensated for separately from the rest of the undertakings.

22,052. Then we come to Clause 10 with regard to the issue of State Mines stock. I need not trouble you with that.

Clause 11 is as to the powers of the Mining Council and sub-section 1 says: "Subject to the provisions of this Act, it shall be lawful for the Mining Council to open and work mines and search for, dig, bore, win and deal with minerals and generally to carry on the industry of mining, distributing, vending, and exporting, together with all other industries carried on in connection therewith. Provided that it shall not be lawful for the Mining Council to lease or sell any mine or minerals or rights to any person, association, or corporation." I do not think we need trouble any more with Clause 11.

Then we come, in Clause 12, to the District Mining Councils and Pit Councils. Sub-section 1 says:

"The Mining Council shall, for the purpose of the carrying on and development of the mining industry, divide Great Britain into districts, and shall in each district constitute a District Mining Council of ten members, half of which shall be appointed by the Miners' Federation of Great Britain." Sub-section 2 is: "The Mining Council may delegate to any District Mining Council or Pit Council such of their powers under this Act as may conveniently be exercised locally, and the District Mining Council shall upon such delegation have and exercise within their district all the powers and duties of the Mining Council as may be delegated to them." Is the Pit Council to have the same powers as the Mining Council? You say the Mining Council may delegate to the District Council or the Pit Council, but you do not include the Pit Council in the next half of the sentence?—I had in my mind that under the next sub-section, the District Mining Council may in their turn delegate to the Pit Council. It may be convenient that the delegation, although technically through the District Council, should be under regulation from the Central Council.

22,053. Could the Pit Council, if the power were delegated to it, control the export trade?—Assuming such powers were delegated, which would be extremely improbable.

22,054. I suppose you would say it would be controlled by the word "conveniently"?—Yes, and "exercised locally." There is full power for the Mining Council to delegate whatever they please to the District Council or the Pit Council. No doubt it would depend upon the discretion of the Mining Council not to delegate unreasonably.

22,055. Then Clause 13 is with regard to the Fuel Consumers' Council and advisory conferences. Sub-section 1 gives power to appoint persons to represent the interests of consumers who are to be what is known as the Fuel Consumers' Council. Sub-section 2 says: "The Mining Council shall have power to convoke at such times as they think fit and under such regulations and conditions as they may prescribe advisory conferences of representatives of District Mining Councils, and the District Mining Councils shall have power in like manner to convoke advisory conferences of Pit Councils within their area." And sub-section 3 says: "The expenses of the Fuel Consumers' Council, National and District Mining Conferences shall, subject to the approval of the Treasury, be paid by the Mining Council." The Fuel Consumers' Council, I gather, is only advisory?—Yes, that is so.

Sir Arthur Duckham: Would you ask, Sir, if it can meet when it wants to or only when it is summoned?

Chairman: I am obliged to you, but perhaps you will ask that presently.

Sir Arthur Duckham: If you please.

22,056. *Chairman*: Then Clause 14 is as to the payment of the Mining Council, District Mining Committees and Pit Committees. It says: "There shall be paid to each of the members of the Mining Council, other than the President, such salary as the Treasury may determine, and to the members of the District Mining Councils, and to the Pit Councils, such salaries and emoluments as the Mining Council with the consent of the Treasury may determine."

Clause 15 provides for accounts.

Clause 16 provides for the transference of existing assets and liabilities.

Clause 17 is as to the payment out of moneys provided by Parliament. We are not responsible for policy, so I do not ask you anything about that.

Clause 18 deals with payment out of Consolidated Fund.

Clause 19 is a clause which gives the mining Council power to make regulations.

Clause 20 is as to statutory regulations.

Sir L. Chiozza Money: Would you mind calling attention to Clause 20, Sir?

22,057. *Chairman*: Yes, I will read it: "Every mine worked under this Act shall be managed and worked subject to the provisions of the Metalliferous Mines Regulations Acts, 1872 and 1875, the Coal Mines Regulation Act, 1908, the Coal Mines Act.

23 May, 1919.]

MR. HENRY H. SLESSER.

[Continued.]

1911, and any other Act regulating the hours, wages, or conditions of labour in mines. (2) There shall be transferred to and be vested in the Mining Council all the powers and duties of the Secretary of State and of any other Government Department imposed upon them by the Metalliferous Mines Regulations Acts, 1872 and 1875, the Coal Mines Regulation Act, 1903, the Coal Mines Act, 1911, or any other Act, regulating or affecting mines or the hours or conditions of labour therein."

Clause 21 is as to the duty of the Mining Council to supply coal, and Sub-section (1) says: "It shall be the duty of the Mining Council to ensure that there is a sufficient supply of fuel at reasonable prices throughout Great Britain, and for this purpose it shall be lawful for the Mining Council, or for any local authority or Government Department acting on their behalf, to establish stores and depots and to employ vehicles and to use all other necessary means for the selling of fuel and to sell fuel within the area of every local authority, and, further, for this purpose it shall be the duty of the railway companies or authorities of Great Britain to provide such facilities for the conveyance of fuel as the Mining Council may deem necessary to enable them to carry out the duties imposed upon them by this section at rates not greater than such railway companies or authorities are now entitled to charge for the conveyance of fuel."

Is there anything in Clause 10 with regard to power to make sidings, supposing it is necessary to make them?—Clause 11 gives power to acquire land. Sub-section (4) says: "The Mining Council may compulsorily purchase land."

22,058. Let us look at Clause 11 (4). That gives the Mining Council the right compulsorily to purchase land and invokes for their assistance the well-known Lands Clauses Acts of England and Wales.

Then Clause 22 is as to the title and the commencement of the Act.

Clause 23 says that the Act shall not apply to Ireland.

22,059. *Mr. Frank Hodges: (To the Witness.)* With regard to this disclaimer clause, which I think is the way it can be described, would that clause provide or permit the Mining Council to disclaim a mining property if it thought that it was an unsuitable property to purchase?—Yes. I take it whatever properties are vested in the Mining Council under Section 5 (1) (a) may be disclaimed under 5 (3) which says: "Provided that the Mining Council may at any time before the appointed day give notice in writing to the owner of, or person interested in, any mine or minerals or rights, disclaiming, during the period of such disclaimer, all or part of the property in such mine or minerals or rights to the extent specified in the notice." They have the power subsequently to take and to terminate their disclaimer, but whatever property is given to them in the earlier part of the section they can disclaim in the latter part if they think fit.

22,060. Your draft does not set up hard and fast regulations as to the conduct of either the Mining Council, the District Councils or the Pit Councils. Is it your view that all the regulations applicable to the working of the industry will be drafted principally by the Mining Council in accordance with what they regard from time to time to be the requirements of the industry?—Yes. As I understand the great necessity is to have an Act which gives considerable elasticity for very varying industries and difficulties and give power to frame regulations and delegate to the District or Pit Council whatever is expedient. Thus the appointment of managers over a particular district, so far as the Bill is concerned, may be decided to be done by the Mining Council or District Council or Pit Council, whichever is most expedient. There is nothing in the Bill to fetter or hamper the discretion of the people who understand the industry as to how they will conduct the pit or business generally.

22,061. *Mr. Robert Smillie:* With regard to Section 20, under that, as it stands now, and as long as the Mines Regulations Acts continue in force, the Pit Committee would not take any responsibility off

the shoulders of the manager under the Mines Regulations Acts?—No. I think, although there is power in Clause 19 to prepare regulations as to functions, it is clear those functions could not be greater than the powers which are already given, or less than those already given under the Mines Regulations Statutes, and if anything were done contrary to the existing laws it would be *ultra vires* as long as the existing law is in force.

22,062. And the power would still rest with the manager under the existing law?—Yes, just as it does to-day.

22,063. *Mr. Sidney Webb:* Your Bill is compatible with various interpretations. The Mining Council may make regulations from time to time. As it stands, under Clause 1 the Mining Council is to consist of 20 members and a President?—Yes.

22,064. And 11 of those would be chosen by the Government in effect?—Yes.

22,065. Consequently that is what would be called an official majority?—There would be a majority of one—namely, the Chairman. Ten would be appointed by the Government, and the Chairman himself is appointed by the Government. There would be 11 appointed by the Government and 10 by the Miners' Federation.

22,066. In clause 2 you make the Minister of Mines responsible to Parliament?—Yes.

22,067. That generally means, if he is responsible he must be able to decide?—Yes.

22,068. I take it, with an official majority, he would be able to carry out the decision of the Government?—I think his position is very like the Secretary of State and the Army Council. In the case of the Army Council you have a number of military members, just as here you have a number of mining members, and the executive powers and regulations of the Army Council are not vested in the Secretary of State but in the Army Council. So here the powers are not vested in the President as such, but in the Mining Council.

22,069. When you come to the District Council, the District Council would be only able to exercise such powers as the Mining Council conferred upon it?—Yes.

22,070. Therefore it would be compatible with the Bill that they should exercise executive powers or be fairly advisory. Would that not be so?—Yes. It is a matter of regulation by the Mining Council what powers are given to the bodies acting under them.

22,071. When you come to the pit council, it would be compatible with the Bill that they should be advisory, or, on the other hand, they might be entrusted with specific executive powers?—I think it goes further than that, because it speaks of exercising such powers as may be conveniently exercised locally, and the use of the word "exercise" means something more than advise.

22,072. At any rate, they will have no powers, except such as are entrusted to them by the Mining Council?—It says, "may delegate . . . such of their powers . . . as may conveniently be exercised locally," and that means something more than advise.

22,073. With regard to the Act of Parliament, the Mines Regulations Act, as Mr. Smillie points out, you maintain intact the authority given by those Acts to the manager?—Yes.

22,074. Similarly, you retain, as I understand it, all the criminal liability of the manager and other persons under the Mines Regulations Act?—Yes, the only difference there is that the authority or owner now becomes the Mining Council, who under the Bill may be sued, instead of the private owner. The manager takes personal responsibility as he does at present.

22,075. Similarly the individual miners are responsible for such things as they are criminally liable for?—Yes. The position of the check-weigher, for instance, is unaffected.

22,076. In the purchase clause there are provisions laid down limiting the compensation to be paid for the coal mines, but you have provided that associated properties are to be separately paid for?—Yes, that

23 May, 1919.]

MR. HENRY H. SLESSER.

[Continued.]

is so. Associated properties are the properties that the Chairman spoke to me about which the Mining Council consider to be subsidiarily connected with or forming part of the mine or mine undertaking, and that includes colliery houses, or such of them as they wish to take over, and they are separately paid for.

22,077. Similarly, you have provided in Clause 9 (2) for a separate valuation and assessments for compensation of the different mines and other properties?—Yes.

22,078. There is not any question of so many years' purchase for all of them?—No, that only applies in the case of the coal mine itself, and not other mines.

22,079. And it is only the maximum?—Yes.

22,080. You contemplate by this Bill that each enterprise would be separately valued?—Yes, and it is rather indicated, owing to the fact that the Commissioners have to look at the nature and condition of the mine and state of repairs, that they may get considerably less than the maximum.

22,081. Now coming to clause 21, which deals with the duty of the Council to distribute over the Kingdom, as I understand, by sub-section (2), it would be possible for that duty to be delegated by the Mining Council to any local authority?—Yes. The object of that section is to give the local authority power—it would be otherwise *ultra vires* the local authority—to undertake this work if the Mining Council delegate it to them.

22,082. I do not see any power of giving a corresponding right of delegation with regard to the export trade?—First of all, there is a general power with regard to export trade under clause 11 (2) (c), and then there is also a power to employ agents and to enter into and enforce contracts. I think those powers between them give power to export and give power to employ agents, because the question of *ultra vires* does not apply except in the case of local authorities. It is open to the Mining Council to employ any agent to export or do anything else for it.

22,083. It would be possible under that section for the Mining Council to employ all or any of the existing export firms to go on with their business as agents for the Mining Council?—Yes. Clause 11 (2) (e) says: Generally do anything that the owner of a mine might lawfully do in the working of the mine, or that is authorised by regulations under this Act or by this Act."

22,084. Therefore it would be possible not only to employ export firms as agents, but it would be possible for the Mining Council to sell coal to the export merchants, and let them carry on the export trade on their own account?—Yes, if they thought wise to do so.

22,085. *Sir L. Chiozza Money*: Returning once more to clause 20, there is no doubt whatever, is there, that it would be *ultra vires* for the Mining Council to make regulations which were inconsistent with the Coal Mines Act?—Yes, I think that is clear. A regulation which is inconsistent with the statute must be *ultra vires*.

22,086. Therefore everything that is contained in the Coal Mines Act stands: as, for example, if you take section 14 of the Act, where the manager is responsible for appointing a fireman. That remains absolutely intact?—Yes.

22,087. *Sir Arthur Duckham*: With regard to clause 14 it says: "There shall be paid to each of the members of the Mining Council, other than the President, such salary," etc., and then it goes on to the District Mining Councils and Pit Councils. In the early part of the Bill you say that the members of the Mining Council shall be whole-timers. Are the members of the District Councils and Pit Councils to be whole-timers?—That depends upon the regulations. Clause 19 deals with the functions, duties and powers of the District Mining Councils, and that, among other things, might very well lay down the amount of time which was necessary for the work.

22,088. The point is that you lay down the Mining Council and not the other Councils?—The whole scheme depends upon the efficiency of the Mining Council.

22,089. They are to sit every day?—Yes, they are. If they do not sit continuously, the whole thing breaks down. It will be necessary for them to see how far they delegate, and it is difficult to say what the other bodies shall do until you see what is delegated.

22,090. You mentioned the function of the Army Council and other Government bodies' functions. Is that surmise or what?—It is only my knowledge of constitutional law.

22,091. Would you be surprised to hear that a decision of the First Lord of the Admiralty carries against the whole of the Board?—Are you speaking of the law?

22,092. That is the constitution?—I think it is quite possible in the operation of this Act that the decision of the President, who is to get the money from Parliament to carry through the scheme, would probably weigh more heavily than any other member with the Mining Council.

22,093. It is not quite a question of weighing. The decision is put forward as the decision of the Board of Admiralty. I am not sure about the Army Council?—I was only concerned to point out in the matter of issuing regulations governing the Army, they issue them in the name of the whole Army Council and not in the name of the Secretary. I should think it is highly probable here the Minister who is to get the money from Parliament to work the scheme will have a decisive voice.

22,094. I only wanted to bring out that he had a decisive voice in other departments?—I think he will work in much the same way.

22,095. *Mr. Evan Williams*: I want to put one or two points by way of explanation. Is it intended by this that the minerals shall be paid for on acquisition?—With regard to the minerals themselves, there is no power for compensation for unworked minerals.

22,096. Then are the minerals which are being worked to go in with the colliery?—Do you mean those actually above the surface of the ground?

22,097. No. Take minerals on lease in a colliery being worked. Is it intended by this to pay compensation for those minerals to the owners of the minerals?—I think not.

22,098. *Chairman*: Mr. Slessor is quite right. It is got at in this way, if you will kindly look at Clause 1(c). They are to transfer all rights and easements and royalties. Royalties are transferred. Now if you look at Clause 6, it says: "Any rights as defined by section 5 (i) (c) of this Act shall not be taken into account in computing such price for all of which"—that is to say, for the royalty rights—"no compensation shall be paid."

Mr. R. W. Cooper: Literally it means a great deal more than that.

Chairman: Yes, but the question is with regard to royalties.

Mr. Evan Williams: My difficulty is that sub-section (3) deals with any mine or minerals. Section 5 (1) (c) deals with rights and easements and uses the words "royalties, lordships or rights in connection therewith." That is, in connection with easements.

Chairman: It says "or other royalties."

Mr. Evan Williams: Yes, but it is "other royalties . . . in connection therewith." I apply "in connection therewith" to royalties, lordships or rights.

Chairman: If that is right, royalties are mentioned.

22,099. *Mr. Evan Williams*: But in (b) coal or other minerals are mentioned specifically, but there is no provision for any payment to be made?—That is so.

22,100. And it is the intention that the coal and minerals shall be acquired by the State without compensation?—The ungoten minerals: those which have not been won.

22,101. Those which have been actually dug out of the ground?—Yes, there would be compensation paid for those on the surface.

22,102. Those which are on the trams or the trucks?—Yes, exactly.

23 May, 1919.]

MR. HENRY H. SLESSER.

[Continued.]

22,103. There is something I do not understand about this disclaimer. Is this construction correct, that the Mining Council may disclaim the purchase of a particular colliery?—Yes.

22,104. And give notice to that effect?—Yes.

22,105. During the currency of that notice the owner is precluded from dealing with it in any way or working it?—Not quite; he has to get the permission of the Mining Council.

22,106. Then at the expiration of that notice that colliery does vest in the Mining Council as if the disclaimer had not been given?—Yes.

22,107. Does that mean that particular colliery vests in the Mining Council without compensation?

No; there is a provision that when it vests compensation is made like other cases. It is only a suspension of the period.

22,108. A suspension of purchase?—Yes. If that is not clear it ought to be made clear. The intention is quite clear. If the draft is imperfect it may resemble other Bills in that respect. The intention is that where the disclaimer is given it is merely to effect a suspended vesting, but when the vesting is decided on that mine is compensated for in the same way as the others taken at an earlier date.

22,109. There is no limit to the length of the notice?—No.

22,110. You may give notice in 10 or 20 years?—Yes.

22,111. So that you may defer the purchase of a colliery for 10 or 20 years?—Yes.

22,112. The owner in that time can only work it if he gets consent from the Mining Council?—Yes.

22,113. And if it is taken over at the end of that notice is the value at the time of taking over that which you take into consideration?—The ascertainment of the value is when it is taken over.

22,114. In taking over a disclaimed colliery in this way—that is to say at the end of five years—is it the value at the end of five years, or the beginning of five years?—At the end of five years, if it is disclaimed. If it is disclaimed the whole thing operates later.

22,115. I think you made it clear that it is possible for the Pit Council to appoint or dismiss managers?—No. What I said was that it is not possible for the Pit Council to do anything which is inconsistent with existing Statutes.

22,116. But it is possible for the Mining Council to delegate the appointment of a manager to the District Council, and it is possible for the District Council to delegate that to the Pit Council?—Yes.

22,117. So that it is possible for a Pit Council to appoint and dismiss the manager of that particular pit?—In that sense it would be possible, provided whatever was done did not offend against existing Statutes.

22,118. There is nothing in the existing Statutes about the appointment of a manager, except the owner must appoint him?—In that sense it is possible, but I should think improbable.

22,119. Powers may be delegated by the Mining Council to the District Council, and by the District Council to the Pit Council?—In the same sense that the Army Council might delegate the power of a general to a private, but it is not likely to happen.

22,120. There is one other point I am not clear about under Clause 20 (2). Does that mean that the present safety control which is exercised by the Home Office over mines is to be transferred to the Mining Council?—Yes.

22,121. All the powers of the Home Office?—Yes.

22,122. The control of Inspectors?—Yes, everything.

22,123. So that the Mining Council, being the owners of the mines, also have powers of inspection?—Yes, except that you certainly would have to have an inspection department. You would have to have a different department. Exactly the same problem will arise with regard to the new Transport Bill which is before Parliament, where the Minister would ultimately be responsible for the inspection.

22,124. Every power the Government now has over mines is to be concentrated in this Department?—Yes.
